SEVENTH SERIES

THE BRIGHT EYES OF DANGER.

Being a chronicle of the adventures and misadventures of Edmund Layton of Darehope in Liddisduill, in the troubled years of 1745 and 1746; of his ride from the Border to the Lothian; certain strange events there; his quest farther North to the Moray Seaboard and Speyside, with its result; all of which were occasioned by his meddling in other folks' affairs.

Written by himself, and now Edited by

JOHN FOSTER,

Author of On Old Speyside, The Bernardine, The Ship of Shadows, &c.

PROLOGUE.

CHAPTER I.

*My mistress still the open road
And the bright eyes of danger.*

I KNOW the voice of my river of rivers: her fresh young treble, clear and careless, rippling over pebbled shallows in far solitudes; deep and sonorous when a hundred hill burns, children of her wild and secret places, leap down, red with mountain rain, to brim her banks and speed her singing to the sea. From the mist-crowned silences in the bosom of the moors around her source, to the great sickle of shining sand reverberant with ocean voices, where her ancient music greets the Moray Firth, story or song is linked with every silver mile of Spey, mother river of my fair province, stream of romance and old years.

Far off the beaten track, the tale I am now to tell was wrought to its end in the wilds amidst the dun distances where the river's cradle lies hidden. There, inconsiderable as a hill burn, her voice a whisper attuned to the stillness around, Spey, timorously venturing to the world from her nest among the lochans, sees the great shoulders of Creag Meaghaidh and Carn Leac heaved against the sky north and south of her moorland cradle; a lonely spot, silent but for wandering winds and the stealthy calls of the whaups.

To-day, in a cleft of the hillside a few birches (ragged remnant of a proud battalion that once lined the slopes) bend, listening to the thin tinkle of a hill stream. There, on an autumn morning in a bloody year of history, two chivalrous men met: one the gallant bearer of a great and sad name, the other a young unknown soldier. The wind may well have held its breath for a moment in that secret hollow of the hills, when Pity and Tragedy beheld two pale young faces in a gray September dawn of a long ago; watched

a swift bitter issue, the challenge and collision between cold duty and warm heart.

Chance, on a well-remembered summer evening, led to the story of a young English gentleman, Edmund Layton by name, being put into my hands. I call it a well-remembered evening, for apart from the finding of the story I have another and a tender reason for holding it in remembrance.

I was on leave and at home, home being the old house among the hills that neighbour a delectable valley of Speyside. I was in those good times a youth given to long days on the hill and the river, with a modest reputation for the Spey cast, and a judge (at least so I thought myself) of salmon and trout flies. So it came about that I received a goodly number of invitations, among them one from the Colonel, an old and dear family friend, who gave me hearty welcome to his house, his moor, and his lochs. Needless to say, I went, and there met his niece Dorothy, who instantly drove all serious thoughts of fishing or anything else, except her own hazel eyes, out of my head.

'All the world loves a lover,' 'tis said; but the majority of people refuse to be bored by the egotism of lovers' maunderings, so I shall pass over the first month or two—the hopes, the despairs; the radiant days on the loch or on the hill beside her; the empty, blank weeks when she was away—and sum up by saying that I was on the sunnier side of thirty, and that I was like other men in the same distemper, only more so.

I had not visited the enchanted spot for at least a whole fortnight—a fortnight that seemed to me to be a year. Truth to tell, I had run out of excuses, for I had trespassed on the

Colonel's good nature in the matter of fishing the lochs, and could not summon up courage or guile enough to make an excuse to present myself at the house.

Sitting in my sanctum one still summer afternoon, I was writing, or rather trying to write, certain overdue official documents. Soft, peat-scented winds stole through the window. I could hear the river's steady voice, and birds calling. My thoughts wandered. The pages in front of me remained untouched, their pristine whiteness an irritation and a reproach. A little fit of depression (my friends call it laziness) seized me. I went to the window and looked out at the garden and the big open spaces; back again to the room and its litter of papers; from the great sailing clouds and the towering mountains to the futile mole-heaps of man. 'Vanity of vanities,' I thought, as I looked around at the rows of books.

However, moods or no moods, there was the unsullied paper waiting my pen. It drew my unwilling eyes to it like a magnet. Conscience, thousand-fingered, pointed to it. I sat down at my desk with a sigh, but my thoughts were elsewhere. My leaden pen stumbled and halted. Half-an-hour's staring at the paper produced nothing but the consciousness of the approach of a headache.

I lit a pipe and went into the garden, where I mooned about, vainly trying to shepherd my vagrant thoughts back to work. The postman approached, whistling like Cymon as he went from want of thought. I watched Donald, almost envying him his placid routine, his obvious content with his duty. He stopped at the gates and then went on his daily round, and I walked down and opened the letter-box. There was only one letter, but it wrought magic in my blood. It was an invitation from the Colonel to fish the loch, and dine and sleep under his hospitable roof. My gloom vanished like mist before the sun. I went swiftly into the house, shut up my desk, and, singing, ran upstairs, three steps at a time, to pack.

Next morning I heard the early larks, for I had a short railway journey and a drive of twelve miles after it before I could reach my destination. The Colonel had sent his car to the station for me. The run through the soft morning air was a delight; hill burns sparkling in the sun; all around me the miracle of the gorse and purple waves of heather; overhead the sky, a great arch of blue. The world was good.

The Colonel met me at a cross-road, for he was in a hurry to be off to the loch.

Dorothy was from home, but would be back that evening in time for dinner. The old gentleman gave me this crumb of comfort as we started for the loch.

'I'm afraid she finds it rather lonely sometimes, here with me. I'm her uncle, of course, but I'm a dull old crock,' said he. 'She's not

been herself lately. Do you know, sometimes I think—well—I don't know.' He concluded inconsequently. 'She has neither father nor mother.'

'“And the maid was fair and beautiful,”' I quoted absently, and, to my annoyance, my host heard me.

'Eh? What's that? I seem to know the line. Tennyson, eh?'

'No, Colonel. The Book of Esther. I thought you began the quotation, or I should not have—er—er'—

'Well, well, I suppose she has a share of good looks,' he said, with a great air of conceding something. I diverted the conversation to trout-flies; and, once firmly in the saddle on his hobby, the old gentleman rode it until we reached the loch and began to fish. I got a two-pounder early in the day, but towards the luncheon-hour the weather changed. There was a rumble of thunder, and down came the rain. We made for the shelter of the boathouse, and, after finishing the sandwiches, lit cigars and chatted, watching the wild burst of the storm whipping the loch. The talk drifted down from high politics and books to local affairs, and incidentally to the discussion of a man whom both of us until lately had been proud to call a friend, but who had failed at a supreme critical moment of his career, and, in the dreadful phrase, had 'gone under.'

'The pity of it!' said the Colonel. 'The pity of it! It means that he is "broken," and "broken" to me is one of the saddest words in the language; worse than ruin, worse even than ill-health. It spells hopelessness—the verdict that says, "Look around at the world of men and women. Henceforth, you shall not be allowed to be one of them. You have a known flaw. You can be no part of the machine. You are cast out—broken." It must work hardly sometimes; but on the whole for justice, at least in the few cases where a verdict is an easy matter. But there are countless cases where it isn't such plain sailing, where it is a tremendous matter to sit in judgment, cases where questions of motives and ethics, temptation, generous, ill-guided impulses often enter; cases where to know all might be to forgive all.'

'Or that, knowing all, one ought to ask one's self, "Had I been in this man's place would I have acted otherwise?"'

'In short, "Do unto others;" but this tired old world is as far from that summit as ever. See! the worst of the rain is over, and while we are yarning away over abstractions the trout may be on the move.'

We went back to the loch, but to no purpose. Neither of us got so much as a rise. After a couple of hours I was glad enough to acquiesce in my host's suggestion to reel up.

We walked homeward by another path. The sun had come out again, pearly the wet trees

and grasses, picking out below us Spey, not yet come to her own, a thin steel chain amidst the heather. We were heading for a ford that the Colonel knew, where we could cross on stepping-stones when the stream was normal, and thus make a considerable short cut. Coming to a little wood of birches screening the thread of a streamlet at the foot of a heathery slope, I saw, in an open space beside the water, a large boulder. Its natural symmetry struck me, and I said so to the Colonel.

'That is the Chevalier's Stone, and, curiously enough, it has a story, the end of which is linked with the problem we touched on this afternoon, the weighing of circumstances, the conflict between desire and obligation, the desperate business of judging one's neighbour;' he said. 'Charles Edward slept in the heather near the Stone one night here, on his way to the coast. Come down and let us look at it.'

It was roughly pyramidal, moss and lichen grown, with no inscription to catch the eye except the arresting date, 1746.

'The curious thing is,' he went on, 'that, beyond the vaguest traditions, I could get no acceptable evidence till quite recently of the Prince having been here. I thought that, when he was in the heather on his flight to the coast, to have come here would have taken him some distance out of his course, and therefore I doubted it. But I have found written and indisputable evidence, hidden in the back of a recently discovered family portrait. Coupling it with the local traditions and the date on the Stone, it makes it as clear as daylight that he was here. Further, it contains the story I have just referred to.'

'Tell me it here, Colonel,' I asked. 'We could not have a fitter setting for romance.'

'Romance it is, and written in the chief actor's own hand. I shall give it to you to read to-night. It will keep till then; and, indeed, the writer of it tells his own story far better than any one else can.'

We lingered by the Chevalier's Stone longer than I wished, for I knew that Dorothy probably would have returned to the house. I am afraid that I taxed the old gentleman's walking powers a little on our way home. Twice, at least, he remarked, 'There's no hurry,' and I fancied that I caught a twinkle in his eye. At last the house came in sight, and with it a vision in white muslin, the central figure in the landscape. The vision came to meet us, and laid a cool little palm in mine, and the touch of her, the sight of her hazel eyes, her smile, sent my blood racing for a quick second or two.

'Bad luck on the loch to-day, Dorothy,' said the Colonel. 'We might as well have been at home.'

'Except that I saw the Chevalier's Stone, and am promised its story,' I said. 'I hear it spells romance.'

Whereupon Miss Dorothy threw doubts upon there being romance in my blood.

'I should never have guessed it,' quoth she airily. 'But I shall know when I hear your verdict on the story.—Uncle, let us exhibit the newly found pictures. The audience ought to see them before he reads the story.'

But her uncle suggested that, as the afternoon had waned, the pictures and the story could keep until the best time of day for story-telling—after dinner.

I rashly agreed, on the off-chance of an immediate *tête-à-tête* with Dorothy. It did not come about, for the Colonel buttonholed me, entangling me in a dissertation on dry-fly fishing, and when I escaped it was time to change for dinner.

PROLOGUE—continued.

CHAPTER II.

OLD silver and roses; lamps with just the right shade of red; a twinkling fire; the table a snowy centrepiece; the rich dark lustre of the old panelling; and Dorothy, radiant, deliciously cool in shimmering white, beside me, made a charming picture. We were a cheerful trio. Given these conditions, to me cold mutton and rice-pudding would have been ambrosial; but the dinner was equal to its setting. My two-pounder from the loch appeared in the gallant guise of *truite froide au court-bouillon*, with *sauce verte*, and the Colonel's hock was Steinberg 1883.

Dinner over, the room was robbed of its radiance, for Dorothy, with an injunction to us not to linger too long, left us to tobacco. We were to join her in the hall, where the newly found pictures were.

The Colonel positively dawdled over his cigar, and when at length he led the way to the hall, Dorothy was not there.

There was no rubbish in the little collection of pictures made up of some family portraits, half-a-dozen moderns, a Cavalier Van Dyck, one Sir Joshua, a Jameson, and others; most of the men in uniform, ruddy, purposeful-looking men; the ladies from ruffs and coiffures to Victorian hoops; some fine copies in oil; and a few *genre* landscapes, mostly of the Highlands.

The Colonel stopped at a recess in the hall.

'The two pictures are in here,' said he. 'They have only arrived from the cleaner last week, and we haven't found time to hang them as yet. Come and help me to fetch them out.'

They were placed in a good light in the hall. One was the portrait of a young man, in powdered wig and pigtail, dressed in a red coat with white *revers* and epaulettes, neckcloth, buff waistcoat, and white knee-breeches. The young face was a handsome and resolute one, tempered by big dark-blue eyes, a suggestion of idealism in them;

a fine forehead ; the shoulders broad to massiveness.

When I turned to the other picture I stared at it in puzzled surprise. It was the portrait of a girl, tall, beautiful, with finely modelled white neck and shoulders, in a flowing black gown ; at her dainty waist a single white rose, her face a delicate oval, looking into the distance against a background of summer sky, dark ringlets caressing her face, pearly teeth just showing in the ghost of a smile. Her eyes held me. They were hazel.

'Why, it—it might have been Miss Dorothy when George was king!' I exclaimed. The likeness was marvellous.

A light laugh fluttered from the end of the hall. I turned round, to see Dorothy curtsying demurely in a costume identical with the picture's, a white rose at her waist, her dark hair in ringlets, her eyes sparkling. She might have just stepped out of the canvas.

'Announce me, uncle,' she said.

'I present to you,' said the Colonel, with his courtliest air :

*'Charlotte Macdonell, first of her clan
To leave it to wed a King George's man.'*

So runs the inscription on the back of the lady's picture. As the likeness testifies, she was a direct ancestress of Dorothy. The other is a portrait of the fair Charlotte's husband, Edmund Layton. I will fetch you the story from the library now. You can read and return it at leisure,' said the Colonel, as he went out.

I bowed low, thinking that if the King's man had been as lucky in war as in love, he was indeed a man to be envied. I looked from the picture to Dorothy, and my look must have showed undisguised admiration and more, for there was a heightened colour on her face as she curtsied again, then suddenly turned to the piano.

She struck a few chords, and began to sing the old Jacobite *cri de cœur*, 'It was a' for our rightful King.'

There was something—the song's dream quality, the calling back of the thoughts to the 'last romance of these islands'—something in the choice of the song, in the setting, the eyes of vanished generations looking down from the walls, the glimpse of the afterglow dying on the great hills outside ; something, too, in the pure young voice that conjured up the strange magic of atmosphere, the elusive something that those without the artistic sense may not, cannot, capture. Listening, I felt, I knew, that the girl inherited, understood, the hearts and the dreams of her Jacobite ancestors.

Other old-time ballads followed, passionate, stirring, of love and war ; cadences and battle songs of the glens of her own north country ; fire and dew.

The last trembling note vibrated round the panelling, and died away. We were alone. She

had risen from the piano, and stood, a young goddess, under sweet stress of feeling, the soul of the song in her dewy eyes—eyes that met mine, telling me, without words, that they had read my secret. There came to us both the moment that comes but once to man or woman.

The Colonel, a packet under his arm, came back too soon. It needed no powers of divination for him to translate the silent happiness in my face, and the shy pride in Dorothy's, into words.

'I could have wished for nothing better,' he said, after a glance, a tremor in his kind old voice.

Be sure there was no happier trio in broad Scotland than we were that evening. We sat late, until the Colonel, with a mock martinet air, ordered Dorothy to bed, and he and I adjourned for a last cigar.

'Amidst these important events,' said he, 'I had almost forgotten Edmund Layton's manuscript ; and as it is also the story of Dorothy's beautiful relative, I will give it into the keeping of you both, a glimpse of old Scotland, and a souvenir of this evening.'

He handed me the packet, and went on : 'I was making some alterations in the old wing of the house about three months ago. One day the workmen, on taking down part of the wall, came upon what looked like a bundle of rags. It was carefully opened in my presence. Layers of cloth, most of them rotten, were unwound, and in the heart of the package were the two pictures we have just seen. The inscription on the back of the lady's portrait—

*Charlotte Macdonell, first of her clan
To leave it to wed a King George's man—*

and subsequent events identified them to my satisfaction to be the portraits of young Layton and his wife, Charlotte Macdonell. They had suffered from neglect, so I sent them to be cleaned. Hidden between the back of Edmund Layton's picture and the canvas, the restorer found the papers you now see, and sent them to me.

'Who put them there? Edmund Layton's wife or a descendant? I cannot tell. Very probably it was the fair Charlotte herself, for she lived here in the fifties of the eighteenth century. Indeed, nowadays, when "the King over the water" is but a romantic memory, it is of little consequence. The papers are in Edmund Layton's handwriting, and tell his own story. You can read it at leisure.'

I took the packet home with me, and the story of the open road and 'the bright eyes of danger' is, I think, worth the telling.

The packet consisted of an outside wrapping around a thick roll of manuscript. On the outside sheet was written in a manly hand :

'To Mistress Layton

At Darehope in Liddislaill.

'This by favour of Patrick Maxwell of the Honourable The East India Company's Service, Esquire, sailing from the Carnatic in the King's Ship "Severn."'

Inside was a part of a letter, evidently written to the writer's wife, and separate from the main story. A page was missing, for the letter began in the middle of a sentence thus: 'where I am recovering slowly from the affair, an account of which I wrote you in my last. I have had a closer look at *the Enemy* than I imagined; but I win strength, and hope to be on my feet soon, and to try again to help Robert Clive.

'I have had but one secret you did not share, dear heart, and I am to tell it to you in these pages. You are all for the Chevalier; and I—— But read the story, and, reading it, the great seas between us, you shall remember many things, as I do now: the night at Holyrood

House; the pipes playing "The King shall enjoy his ain again;" the white cockade you gave me; the ride from Kielder into the mist; my quest North in the *Gannet*; and afterwards, Darehope and the brave green hills of the Border. And (if your Jacobite heart can) you shall understand why I sailed out to this far Carnatic, and, understanding, you may forgive my leaving you.

'I am minded to set down the story in full. It may serve to shorten the long days as I lie here, and it seems unlikely that I shall have as much leisure again in this far-away, and, as you would say, *ill-contriven*, country. For the surgeon lays it upon me—though my wounds are mending—not to stir abroad for weeks, an irksome business. Yet I ought not to chafe, rather thank God's mercy that'——

Here the letter ended abruptly, a page having been torn off; but the roll of manuscript contained the main story in Edmund Layton's handwriting, thus.

(Continued on page 19.)

'No. 2 GIVEN AWAY WITH No. 1.'

By E. LATHAM.

THOSE of our readers who are not old enough to remember the palmy days of such periodicals as *The Boys of England* (begun in 1866, and discontinued, we believe, in 1889), *The Young Men of Great Britain* (begun in 1868), and *The Penny Miscellany*, when what are termed 'penny dreadfuls' were in the heyday of prosperity, say forty to fifty years ago, will not readily recognise the once stereotyped phrase which heads this article. The writer is old enough to remember the time referred to, and he has now before him the 'penny numbers' of three of these—novels shall we call them?—of the period. These fair samples will form the basis of our remarks, and enable our younger readers to form some idea of the kind of fiction which was so plentifully supplied, and for which there was such great demand, at the time mentioned. The pernicious literature of the present day is perhaps no better in many respects than it was then, but it is very different. We all know what current literature is; we need only deal with the 'penny dreadfuls' and even 'a penny 'orribles' of the sixties and seventies: our readers can make the comparison for themselves.

Of the popularity of such fiction as we refer to there can be no doubt. A footnote in one of the tales we shall notice, referring to a hope expressed by one of the characters that the hero will be popular, says: 'If a sale of forty thousand of Number 1 of his adventures proves his popularity, he is so.—PRINTER'S NOTE.'

Let us begin with '*Charley Wag, the New Jack Sheppard*, by the author of *The Woman with*

the Yellow Hair, Somebody Else's Wife,' &c. The story is in four books, and is issued in penny numbers. We are both right and wrong in this statement. Each *fasciculus*, published at one penny weekly, consists of sixteen pages and two numbers, numbered on the first and ninth pages respectively, and yet the first week's issue is called No. 1 at the folded edge. This system obtains throughout, Nos. 15 and 16 showing on the edge No. 8, and so on. In this way it may be said that as well as No. 2 being given away with No. 1, No. 4 is given away with No. 3, and so on. There are in this story seventy-two single or thirty-six double numbers, plus three pages of text at the end.

A few extracts will be interesting, either for the purpose of comparison or taken by themselves. Book I. is entitled, 'Childhood in the Gutter;' the first chapter is headed, 'All but Murder,' and begins: 'A woman ran wildly down one of the several steep flights of steps leading from Hungerford Market to the quay below, and creeping along upon the slippery stonework overhanging the water, paused for a moment at the extreme point, cast one fearful, shuddering glance around, and FLUNG HER CHILD INTO THE RIVER. The rain was lashing heavily against the window-panes, and the wind sweeping in fierce and fitful gusts along the deserted streets above, while every now and then a streak of livid lightning rent the air, followed by deafening peals of thunder—— . . . She was young and almost beautiful, but deadly pale; her hair—— . . . Her flashing eyes, set teeth, and knitted brows bespoke her courage and

determination, and her DEADLY PURPOSE. She tore the sleeping babe which a moment since had nestled at her breast, from its warm shelter beneath her thick plaid shawl, raised it high in the air, to give her the more power, and flung it fiercely from her into the black and sluggish waters gurgling at her feet. "Thus perishes the record of my sin and folly." It was more a murmured than a spoken thought, for her blanched lips scarce gave utterance to any sound; but had it been instead the loudest shriek, the raging tempest would have drowned her cry in its boisterous fury. . . . No one had seen her, no one followed her. The darkness hid her retreating form, and Heaven alone was witness to her crime. The would-be murderess fled away, careful alone of her own safety, heeding not how fared the little living bundle the dark waters swept along towards death. What hope was there for it? What guardian angel came to rescue it? None other than TODDLEBOY.

Well, the child is taken to a public-house, 'The Drinking Fish,' frequented by Mr Toddleboy, and under the care of the landlady revives; and the author remarks: 'Of course *you* know very well, gentle Reader, as well as I do myself, that I never intended the baby to die, or else what good would there have been in rescuing it and intruding it upon your polite consideration? No—to ease your suspense—supposing you feel any (and if you are a very young reader, I don't know that you may not after all), I may as well tell you that in an hour's time IT WAS ALIVE AND KICKING.'

Then follow various expedients resorted to by the successive people into whose hands the baby falls, each trying to get rid of it in pantomime fashion, until at last it comes into the possession of a kind-hearted woman who takes care of it. The hero, Charley Wag, becomes in Book II. 'The Boy Burglar,' and in Book III. 'The Jail-Bird.' Book IV., the last, occupies more than half the whole, and is entitled, 'The Most Successful Thief in London.' Of course Charley turns out to be the son of a duchess.

The following is from the last chapter: 'In one of the handsomest mansions in Park Lane a ball, given in honour of some foreign princes, was taking place. In the brilliantly lighted salons were assembled the *élite* of England's aristocracy. All seemed to partake of the gaiety around, and the host, a handsome young man, was about to lead the lovely daughter of the Earl of Dumbledore to join the dancers, when a tall, grave-looking man approached, and requested a few moments' private conversation. The host conducted his fair companion to a seat, and complied with the stranger's request. The stranger proved to be a detective, and the gentleman whom he came to apprehend upon a charge of murder, and with whom he had requested a few minutes' private conversation, was our hero, Charley Wag! . . . A verdict of guilty was

found, and our hero was condemned to death. The sentence was to be carried into effect the following morning, when, to the astonishment of the officials at Newgate, the prisoner was respited, and afterwards pardoned. The Duchess of Heatherland had saved her son's life. On the day before the execution was to take place she had an interview with the Home Secretary; to him she had explained all, and to him she proclaimed our hero, Charley Wag, as the heir to the dukedom and estates of Heatherland. This will, in some measure—in 'some measure' is refreshing, and the respite and subsequent pardon of a murderer, even though he be the son of a duchess, requires a fairly strong imagination on the reader's part—'account for Charley's respite and subsequent pardon. Feeling that the position he had succeeded in establishing in society was gone for ever—we should think so indeed—'our hero determined upon going abroad, where he passed the rest of his life in strict retirement.' Probably he did.

The tale concludes: 'After justice had overtaken Bloodyer, Faversham,' whom the duchess had married, 'had altered visibly, and latterly the duchess perceived that his mind was affected. She seldom permitted herself to lose sight of him; but on one occasion he succeeded in evading her vigilance, and set off for London by the last train at night. The duchess discovered his absence soon enough to catch the same train. Curious to know where he would go, she did not interfere with him, but kept him in sight from the moment of leaving the terminus at Waterloo-bridge. Striding onwards, Faversham made his way to his old house in Bayswater.' We should think the duchess was rather tired if she followed him on foot. 'At the back of this house was an old cellar which Faversham rented; in this he had, years ago, caused a bricklayer to build him another or inner cellar. In this place were the bodies of all Faversham's victims! To this cellar the madman bent his steps. Entering the first cellar, the door of which he left open while he procured a light, Faversham passed into the other chamber without observing that he was followed by the duchess. Here a sight presented itself which curdled the blood of the shrinking woman. Lying about in all directions were the bodies or skeletons—a modern Bluebeard, eh!—'of the unfortunates who had been murdered by Faversham; and in a corner, over a few bones, the madman was crouching down and muttering incoherently. The duchess, unable to control her feelings at the ghastly spectacle, gave vent to an exclamation of horror. Uttering a yell, the maniac sprang to the door and closed it. The unfortunate woman was shut in with this infuriated demon. Vainly did she beg of him to spare her life and return home with her. The madman heeded her not. She must die. *His vow must be fulfilled.* Again giving the terrible yell, he clutched her by the throat, nor

did he relax his grasp until his victim was a corpse. Then, flinging the lifeless body from him, he sat chattering by the bones in the corner until late in the night, when he fell asleep. When he awoke he was sensible of the horrors of his situation! His wife, murdered by his own hand, was lying a corpse at his feet, the bodies of his victims around him, and, oh! horror! escape impossible! The door of the inner chamber closed with a spring, and thus the madman in his frenzy had sealed his own death-warrant. For days the wretched man—wretched indeed—remained fully alive to a sense of what his fate must be; but at length, worn out and exhausted from want of food, and his efforts to make his terrible position known to the outer world, death came to his relief, and the charnel-house of those he had murdered became his own tomb.'

We may mention that there is a copy of this interesting work in the British Museum Library; but the last one hundred and thirty-nine pages are missing; the writer's copy wants pages 529-40 and pages 543-58, but is otherwise complete. The comparative scarcity and bad condition, or incompleteness, of existing copies of this class of literature (!) is probably accounted for by their destruction or ill-treatment, like school-books, by their youthful owners.

Having given sufficient particulars of Charley Wag to serve our present purpose, let us glance at another typical example, *The Blue Dwarf*, by Lady Esther Hope (a pseudonym, we believe). Book I. is called 'The Foster Brothers.' In the first chapter a figure steals into the bedroom of a sleeping youth and replaces a bottle on a small table at the bedside by another similar one. Shortly afterwards a figure crawls from beneath the bed and substitutes another similar bottle for that left by the previous visitor. The second figure chuckles—not too loudly, it is to be hoped—and silently leaves the apartment.

Here is a description of the Blue Dwarf, from whom the story takes its name: 'When the assassin fled . . . it was no imaginary cry which pursued him as he rushed down the dell. A rushing sound followed his escape, and something entered the room in which the foul deed had been done. It was a man with a dark lantern, the light of which was now shed upon the insensible body. And such a man! About four feet high, with short legs, and arms that reached considerably below the knee, this sudden apparition appeared to have no redeeming point in his deformity. His face was hideous; grizzly hair like that of a negro surmounted a low narrow forehead; little red-circled eyes, themselves rather green than any other colour—he preferred green, we may take it—'a huge mouth, revealing teeth filed to a point and died'—'died' is good, but probably this is not the author's fault—'jet black;—we should have thought a

'dead' black more appropriate, had the author known—'a beardless chin—might have all passed still as accidents of nature to be explained by sickness; or premature birth,'—but the filed teeth, how can they be explained in this way?—'or some awful terror on his mother's soul'—a kind of accumulation of birth-marks, we suppose. 'But his skin was blue'—ah, we had overlooked this incontrovertible and inexplicable fact—'blue as indigo, with spots all over his face, neck, and arms of a blue-black.' Stephens' ink must have been nothing in comparison. 'He was shaggy too, like an orang-outang. He wore a fantastic dress like a gnome king in a pantomime, composed of coarse stuff of foreign make.' Enough, or the picture will be too much for our imagination.

This novel, too, is in four books. Book II. has no title; Book III. is 'The Great Rat-trap,' and Book IV. 'The Blue Dwarf's Story.' In this case No. 2 is given away with No. 1, and the rest are issued singly; and with No. 26, so it says, is presented gratis Nos. 1 and 2 of *The Confessions of a Page*. By the author of the Fourth Series of *The Mysteries of London*.

In the last chapter the Blue Dwarf, whose name is Goldy Gordon, *alias* Sapathwa, disappears from the scene in the following manner. A solitary horseman arrives one stormy night at the door of a small tenement adjoining Berlin Cathedral, and, presenting an order to the keeper of the vaults, desires access to Vault 20. 'When they arrived at the entrance to the vaults, "Thank you," said the stranger; "give me your light. I know my way now. I will not trouble you further." "The lamp will not last you long," suggested the old man. "It will last quite as long as I shall require it," said the other. "And when you come out again, may I ask you to be so kind as to fasten the portal after you?" "Yes," replied the stranger, with a strange, sad smile; "when I come out I will do so." The keeper then tremblingly gave him the light, and the unknown descended. "Well," thought the old man, as the other disappeared, "I shouldn't much like to go down there so late, and on such a night as this; but there's no accounting for tastes—he looks quite delighted at it. Well, he's gone, and I will go too." He *was* gone. The door closed after him, and closed after him *for ever*. He never returned; and not until his dying day did the old man narrate to any the story of his strange visitation. . . . It was about the time of the old keeper's death that the foundation of Berlin Cathedral was found to be slowly sinking, and it was necessary for workmen to descend into the vaults. The mystery of the strange visitant was then, at length, cleared up. In that vault, which contained the coffin of Miriam Blakesley, was discovered, clasping the last relic of the inanimate form, the skeleton of him who was known in life as THE BLUE DWARF.'

You see both these edifying narratives end with skeletons in vaults, a murder, and the murderer's involuntary death in the one case and a voluntary death in the other.

The British Museum Library contains two copies of *The Blue Dwarf*, one of the first and the other of a subsequent issue. The earlier copy (1861) is imperfect, wanting all after page 392; the writer's is complete, with 478 pages. The later edition (1875) is considerably abridged, and, as stated in the catalogue, 'after chapter lxxxiv. the text of this edition differs from that of the preceding.' The change comes suddenly in the middle of chapter lxxxv., and there are only one hundred and forty-two pages in all, and the story ends quite differently. It is difficult to account for the alteration, but evidently for some reason it was desired materially to abridge the story.

Another anonymous novel of the period is

Schamyl; or, The Wild Woman of Circassia; and the following are advertised in its pages as 'now publishing in penny weekly numbers: ' *Vice and its Victim*; or, *Phæbe, the Peasant's Daughter*; and *The Ocean Child*; or, *The Wanderer of the Deep*.

Then there was *The Boy Sailor* and *The Boy Soldier*; and, although, as usual, No. 2 was given away with No. 1, these were issued in halfpenny numbers of eight pages each. *The Skeleton Crew* was the enticing appellation of another of these 'a'penny 'orribles,' the vogue of which, we are pleased to see, has passed away. No longer is it necessary, as an inducement, to give away No. 2 with No. 1 of any novel; indeed, they are no longer issued in penny or halfpenny numbers at all. In these days of cheap printing, complete novels are issued at sixpence and sevenpence per volume, and those of the Charley Wag type are 'as dead as a door nail.'

THE DRIVING FORCE.

By MARIAN BOWER.

CHAPTER I.

He fights, as others, to win or fall,
But the spell of the woman is over all.

IN the earlier years of the reign of Louis the Sixteenth of France, two boys were brought up together in the old château of Palud-les-Baux, which is not very far from the border between France and Switzerland. Indeed, on a clear day, standing on the heights which rose above the stately, many-windowed château, and looking between the hills, some of them high enough to have caps of white all through the winter, one could see a patch of intense blue, which those who knew the country recognised as Lake Leman sleeping placidly—the water was quite another colour when a storm raged—in the sunshine.

The two boys saw the lake so often that they knew it in all its moods, but they never dreamed what a part that stretch of vivid colour was to play later in their lives; and Marie-Félicité, when she condescended to climb up the hill with Henri on one hand and Lucien on the other, just looked at it indifferently with eyes which were no whit less vivid in shade.

Almost as soon as Henri Hauteville de Palud and Lucien, his cousin, could remember anything, Marie-Félicité was the centre fact in their existence. Some children are children to the last possible day of childhood; some are potential men and women from the first moment that they think for themselves. Both the boys anticipated time, and indeed the age was precocious enough without their doing that, when lads were married at fourteen and had sons at eighteen; and the driving force in each was the same—this said Marie-Félicité.

She came into their lives on a spring day.

The boys had been climbing a hawthorn-tree in the park which surrounded the château. They elected to cut branches of the white bloom, and Lucien held the knife. As he slashed hard, the point of his knife dug deeply into Henri's right hand. It made but a small wound, yet that wound was deep and ugly. Both boys hurried into the château; instinctively they made their way to the servants' quarters in the basement, and there they met old Gasper, who dressed the wound with 'simples' after the primitive methods of the time.

The boys were just emerging into the sunlight, when they saw, first across the moat, and then standing at the head of the stately steps which led from the terrace before the house on to the level of the park, the Vicomte de Palud, Henri's father, and with him a little girl. The boys pulled up at once. The Vicomte had been from home for two weeks at least—no one in the château had known precisely when he would reappear—and now, when he arrived unexpectedly, it behoved the younger generation to greet him respectfully.

With a sigh, Henri looked over to the green trees, to that white blossoming hawthorn-bush. He expected to be questioned about his hand, which Gasper had put into a sling, and then to be forbidden to go out again. Lucien followed his glance no less willingly. If Henri were sent back to Monsieur l'Abbé and his studies, he would be too.

But the Vicomte, instead of waiting for the boys to come up the great, wide, stone steps, approached them. He crossed the drawbridge over the moat. No house of pretension at that epoch in France was ever left without its draw-

bridge and its moat, though for purposes of warfare they were both obsolete. He came on until he faced the boys, and all the time he held the hand of the little girl, who was dressed in the unchildlike garments of the time.

'My sons,' the Vicomte began, for he called them both his children, though Lucien was but the son of his younger brother, 'I bring you a new playfellow. Treat her as the sons of my house ought to treat one who is an orphan; be kind to her—considerate. Her mother'—The Vicomte stopped. The moment of expansion was over; it gave place to the elaborate artificiality of the age.

'Mademoiselle,' he said to the befrilled, betrailed mite, 'I present my son, the Marquis Henri Hauteville de Palud.'

The boy pulled off his cap with his left hand, and bowed low.

'My nephew and adopted son, the Comte Lucien,' went on the old man—'Mademoiselle Marie-Félicité de Chervenie.'

The little figure curtsied to the ground. The boys bowed again.

Then the Vicomte had leisure to inquire about Henri's hand. 'You should take care; you were foolish,' he said, with the typical intolerance of the day for all that was merely youthful; but he did not send the lads in to their tutor as they expected. Instead, he indicated Marie-Félicité. 'Take care,' he said, 'that you are not so rough with mademoiselle.'

He turned as he said this. He left the three children in the sunshine, looking awkwardly at each other; but hardly had he reached the steps up to the terrace, when Marie-Félicité took command.

'*Mais, dites-moi,*' she observed, as the queen might speak to a subject, 'your hand, it must hurt!' and she looked at Henri.

'It was an accident,' the boy answered hastily.

'It seems to me a stupid one,' returned this little princess.

'Lucien could not help it,' Henri protested.

Mademoiselle de Chervenie—something less than nine years old—looked at the other boy. He did not meet her gaze as readily as did Henri. 'If you could not help it,' Marie-Félicité said to him, 'you can be sorry about it.'

'Who said I was not?' blurted out Lucien, human nature entirely getting the better of all the prescriptions of etiquette.

Mademoiselle smiled as loftily as one could when one was something under five feet in height.

'I knew he couldn't help it,' put in Henri.

The young person before him nodded. '*T'es bien,*' she remarked; 'and'—reluctantly—'of course the flowers, they are pretty.'

Henri might have spoiled his cause by declaring that a boy did not concern himself with such a thing as whether a flower was pretty or ugly, but Lucien broke in.

'Henri,' he cried out, 'we cut down lots of

branches. Let us make—her—Queen of the May.'

The thought pleased every one. The boys hurried up the slope, bringing back each an armful of boughs. They seated the little girl on a throne they made for her; they held the tufts of blossom above her head, and waved them, shouting, '*Vive la Reine!*' as they had heard the courtiers shouting at Versailles. And as they waved their branches the white petals dropped upon the little girl's black gown, and a gleam came into her eyes. She lifted her powdered little head, arranged her stiff skirt, and so began the reign of Marie-Félicité de Chervenie, who was an orphan, but by no means a penniless one, at the old Château de Palud.

Again it was on a brilliant day, when the water in the moat glittered in the sunshine, when all the fields were tender green, when the vines on the warm, sheltered slopes were putting out their young shoots, when the May blossom was abloom, and the sky was a vault of cloudless blue, that Marie-Félicité, albeit quite unconsciously, put the next spoke in the wheel of destiny.

The two boys were on the verge of what at that time was counted manhood. They had persuaded Marie-Félicité to mount the slopes behind the château with them. Of course a young lady of her quality was not permitted to roam abroad without a duenna; but old Madame Buchard, her *gouvernante*, was stout. The three had but to walk fast, and the old lady would take a long time to toil after them. They knew this by experience, so they set out on a joyous frolic; and if old madame complained to the Vicomte, Marie-Félicité, who could mostly do as she pleased with her guardian, just because she was so like her mother, undertook to divert the paternal wrath. But the adventure took a turn very different from what the three anticipated. Long before old madame reached them, Marie-Félicité had balanced herself on a spur of rock, her thin slip of a body drawn to its full height, her head thrown back, her eyes wide open, as though they were staring at something which they had never seen before. And in truth they were.

Marie-Félicité had the two boys before her. They stood, not as companions, not as her followers, eager and willing to obey her caprices, but as suppliants, and they themselves had made her their judge.

The matter was comparatively trifling. It was not until long after, looking back on it with her perceptions sharpened by such trials as fell to the high-born women of that day, for the most part because the blood in their veins was blue, that Marie-Félicité realised that here was the parting of the ways.

The verdict, her verdict, went against Lucien. It was just, but she made the punishment merci-

less. Youth is so cruel, because it does not understand; only one thing can be harder, and that is old age that shuts its eyes on experience and will not understand.

Lucien trembled under Marie-Félicité's condemnation. He looked at her all the time she spoke, and had she but once smiled at him—who knows? But the boy had done a mean thing, and Marie-Félicité had been brought up to think of meanness as not only ignoble, but as against the creed of a gentleman.

He had shifted the blame for a small offence on Henri, and Henri, disdaining to speak, had suffered the punishment for it. But Marie-Félicité was quicker than the excellent old Abbé, who taught the boys and Marie-Félicité herself when the subject was beyond the range of Madame Buchard. The excellent Abbé, who perpetually made what he called 'observations' to madame as to how children should and should not be brought up, was under the impression that his was the paramount influence. He might rule the boys; he certainly did not rule Marie-Félicité. On the contrary, she ruled him; and now, as mademoiselle pursued the subject in her mind with skilful questionings on her part and halting replies on Henri's, the girl intimated that she would make it her business to prove to Monsieur l'Abbé who was innocent and who was guilty.

That being settled in her mind, she turned to Henri. '*Mon cousin*,' she said to him, 'conduct me down to the château.'

She put her hand into the boy's, and in the most solemn imitation of that grand manner which not one of the trio, nor even the duenna, whom they met on the way, hot, and in imminent danger of one of those mysterious attacks she habitually suffered from when Marie-Félicité got more than usually out of hand, thought stilted or foolish.

The two went together down the green slopes. Her ridiculous train trailed over the fresh grass; Henri had his hat under his left arm, the girl on his right; and as they went along, the stateliness to which they had been born warred with the call of humanity in Henri's heart.

For the first time, he realised how small was Marie-Félicité's hand—how soft. For the first time, he wanted to go on holding it. But the boy is father to the man; and to the last day of his troubled life Henri de Palud was that glorious thing—a gentleman. At the great door of the château he relinquished his hold.

Marie-Félicité did not even seem to notice that he had done so. He remarked this with a passing sensation of disappointment which he did not understand at all; and when she found herself on the second flight of the wide steps, with the house stretching the full length of the wide terrace, and a group of dolphins and sea-horses finishing the façade high up before her, she turned as if to say something omitted. But

Henri had walked away. It was Lucien who stood below.

For a moment the two eyed each other. Lucien's face was dark, his eyes were sombre, and his lips were pressed tight together.

Marie-Félicité examined his face. She had never seen it look at all like this before.

'*Ma foi!* but how *drôle* you look!' she observed.

Lucien, for answer, jerked out that which he had followed her down to say. 'You let Henri conduct you home!' he blurted out. 'He does not take better care of you than I should. I will go and tell Monsieur l'Abbé myself now. I will go and tell monsieur, *mon père*, and he will have me beaten, if you will let me bring you back next time.'

Marie-Félicité did not wait a moment. Her words leaped out. 'I let Henri bring me back because you were mean, and he would not tell on you to clear himself. That is what Monsieur l'Abbé tells us heroes always do. Henri, then, is a hero.'

'And I am?' thrust in Lucien.

Marie-Félicité looked down on the boy. Her blue eyes were very blue and her lips were cherry-red. 'You,' she said mercilessly, 'are a coward and a sneak.'

'Then,' returned Lucien—and how still was his voice!—'you will not give me your hand?'

'No,' said the child; 'I will not give a coward my hand.'

And that childish episode was the beginning of everything. Soon after, Lucien left the old château. Marie-Félicité vaguely understood that the Vicomte, who was growing very old now, was displeased with the boy he had brought up as his own son—was troubled about him. At first Lucien came back twice a year; then the intervals became longer. At length he ceased to come at all; and the times grew evil and more evil, for the Revolution, that nightmare when France went mad with bloodthirstiness, was drawing nearer day by day.

One afternoon Lucien returned. He came in the winter-time when there was snow on the ground, when the high hills bordering Lake Lemane rose up cones of whiteness, and when the sky every night on the horizon was red with the burning of some château by the mob. But as yet Palud and those living in it were untouched, partly because it was so far out of the reach of the great towns, and partly because the old Vicomte had dealt so generously by those poorer than himself, had succoured the helpless and tended the sick; so that for the present—one could say no more—his own dependants had not made up their minds to turn him out of his house and hale him to prison.

Lucien came unexpected, unannounced. Marie-Félicité was sitting over a log-fire in the great hall. The flickering blaze showed him her face

as he entered—showed him that she was a woman now, and even more beautiful than she had promised to be. It showed him, too, that nothing was changed in the familiar room. The silver flagons still stood on the carved chestnut sideboard; the armour hung from the roof; the roof itself was still gay with the painting on its beams, fashionable in that day. The old Vicomte had changed nothing. If the mob broke into his house, they should find it as it had been in the days of security.

But after just a cursory glance, Lucien gave no more thought to material things. He went up to Marie-Félicité, stood before her—and, though she never knew it, he hesitated. He looked into her face, and it flashed into his mind that sin was hateful; that vice lowered and did not amuse; that if some women were light, there was one here whose price might indeed be higher than rubies. He stood abashed; it was all he could do not to hang his head. Marie-Félicité rose when she saw him. She welcomed him, told him how glad she was to see him, and chided him for his absence. 'But,' she added, 'of course you are come back to us now when we need you.'

He came a step nearer. When she needed him! *Ciel!* if she took account of his coming and going, might it not be that he had a place in her heart—the supreme place?

If so—if so! He breathed hard. The mist swam before his eyes. He heard voices in his ears—the coarse voices of the Paris rabble; his mind saw all the horrors that had been enacted in that city, and saw them with loathing, as things he would fly from for ever.

In one moment he would have been at her feet; he would have been pouring out his soul to her; he would have been telling this girl that whatever he had done, whatever he had left undone, deep in his heart had ever remained his love for her; but as all the flood of words was trembling on his lips, a door opened and shut somewhere in the back of the house.

Marie-Félicité did not turn her head; but the firelight showed her face—showed it to Lucien. 'Who is coming in?' he cried out fiercely.

'It is Henri,' answered Marie-Félicité.

'And you love him!' ground out Lucien.

The girl looked up at the dark face before her. 'I am Henri's wife,' she answered. 'We were married by Monsieur l'Abbé in the chapel here a fortnight ago.'

The man, who had ridden day and night from Paris, turned away abruptly. He walked down the long hall; he walked past the portraits of former Vicomtes, his ancestors as well as Henri's; he turned to a little door in the wall—he knew his way—he opened it, and he went up the winding stair into the turret where the old Vicomte had a little room.

Here—while Marie-Félicité stood in the hall, a prey to sudden fear; while she asked herself

what this could mean—the uncle and the nephew had a brief interview. The old man learned that the boy he had brought up had forgotten the order into which he was born; that he had forgotten his duty to his kind, to his country—even to his Maker; he heard that he himself was dispossessed, and that if he wished to escape arrest, he must be content to hand the château over to his nephew, and, if he stayed at all, stay on sufferance.

The old man rose up. His head was white, his eyes were dim, and he was oftentimes bowed down by the weight of his many years; now he straightened his shoulders and put his hand on his sword. 'Lucien de Palud,' he said—and every word came out with a stern reproach—'you were but a child when I brought you here. You lived with me as my own son; I loved you only second to Henri. I taught you what I deemed was your duty. I kept nothing back from you. I told you that France needed real men; that to me a man's place was in the home of his fathers, helping those who were weaker and poorer than himself. I told you that I would not make you into a mere man of fashion, a loungeur in Paris and Versailles, but that if you wanted to fight for France I would let you go; that if you wished to work for her, I would let you go. You left the château—left it of your own free-will. I heard of you—and who lived a more dissolute life? Then came this storm, and you turned the colour of your coat. You were as dissolute as ever, as abandoned, but you belonged to the people. And now you have yourself come to tell me of your shame! Go!' and the old man thrust out his right arm—'go, before I curse you; and it may be, since as a lad you were a good lad, that within you is that which will bring you back, not as my supplanter, but to share with us the dangers and the perils; that which will lead you to serve your king and your country, not to betray them.'

Lucien heard; he saw the imperious gesture. He swung round on his heel. He went out of the little room, with the last ray of the setting sun (it was going down behind a bank of dark cloud) lighting up his uncle's face, with the shadows creeping out from all the corners.

He went down into the hall. The log-fire still blazed on the wide hearth; he looked up at the gilded device of the Paluds, cut deep into the stone of the great broad chimney-piece which slanted right up to the roof; he looked at the row of windows, each with a separate coat of arms emblazoned in the upper panes; he looked at the great coffer standing against the wall—it had been given by Catharine de Medici herself to a former Palud; and last of all he came back to what were to him the most valuable things in the whole room. These were only Marie-Félicité's little table pushed up into the circle of firelight; only the bit of needlework on it that she must have been stitching but

a few moments before; only the book she must have been reading, for there was an end of coloured silk in it to mark the place. He took up that book and opened it. He read a line; the printed words were so applicable to his case that he paused, with the page open; then he hurriedly turned back the leaves till he came to the frontispiece. He looked at what was written there. 'From Henri,' was all he read; but it was enough. He dropped the book as though it had stung him. He put his foot on it and crushed it. It actually gave him pleasure to see that he had torn a leaf; that he had discoloured another page.

Lucien de Palud, and such as he, had unchained a force of whose strength, it must be remembered when one tries to weigh their merit or their guilt, they had at the beginning no conception.

Heaven alone knows what France suffered in

those dreadful days. If there were guilty ones—and there were—the innocent paid for them a thousand times over. And so it came to pass that though Lucien hesitated to dispossess his uncle, the Vicomte did not long enjoy the pleasures of his home. He was set on and murdered at his own door. His home was wrecked, and the mob—for it had reached Palud at last—having tasted blood, clamoured for more. Every one knew that the old man had a son. There had been a woman, too, in the château. The fancy of the multitude turned especially to that woman. They wanted a refined, delicate creature whom they could bait and insult, whom they could drag about with them until her limbs gave way under her.

But for the moment they were balked. There was no trace of Henri de Palud or of Marie-Félicité, his young wife.

(Continued on page 25.)

THE DUTIES OF THE BRITISH NAVY.

By R. A. FLETCHER.

HOW and where does the British navy do its work? and what are the conditions under which its never-ending duties are performed? are questions of paramount importance. Recent events have now shown more conclusively than for many years that the possession of a strong navy is essential for the protection of this Empire, and must have converted to this view even those who have been disposed to carp at naval expenditure.

The navy is maintained in peace for two distinct but inseparable purposes. The first is that it may protect our oversea commerce, the constant stream of ships conveying raw material and food-stuffs to the United Kingdom, and also our manufactures abroad, thereby ensuring the country's commercial activity and prosperity; and, in the second place, it is maintained in order that it may announce the world-wide power of Britain, and her ability to protect by force if necessary those trade routes and commercial resources upon which the very existence of Great Britain depends. Nor is it only Great Britain which has to look to the navy for its safety. The whole of the British Empire, from its most important to its most insignificant unit, now unanimously recognises the necessity for an adequate navy. The protection of British interests in times of peace is accomplished as much by the ubiquity of British war-vessels as by the actual force each vessel possesses, for behind each vessel is the knowledge that it represents the British fleet. The British Empire is scattered all over the world, and British warships are generally to be found either near British possessions, on the routes between them, or patrolling the main ocean routes adopted by British commerce. Thanks to the possession of a numerous fleet—

whether sufficiently strong numerically time will reveal—Great Britain is able to indicate to all and sundry in all waters that she will assert British rights and protect British interests when necessity compels, whether the occasion be a 'scrap' between two rival chiefs on some Pacific island, a gun-running affair in the Persian Gulf or the Red Sea, the suppression of illicit trading on the East or West African coasts, an encounter with Chinese pirates, the punishment of turbulent Malays or other East Indians who have looted a stranded steamer, or one of the many other incidents, often of a far graver character, in which our navy does its duty, though scarcely noticed by newspaper readers.

Britain's proverbial disposition to compromise and avoid threats and hostilities whenever possible has created a general impression abroad that she will go to any lengths rather than resort to force. The means which Britain is able to employ to disabuse the German mind of this erroneous impression are no doubt equal to all requirements. The pity of it is that there should be among Britons, at any time, differences of opinion as to what constitutes an adequate navy, one able to uphold British interests wherever these are endangered. The navy, however, is not intended to supplant diplomacy, but is one of the three great weapons which diplomacy can wield; in some out-of-the-way places it is the only weapon. The other two are the army and that diplomatic pressure which is veiled under international commercial negotiation.

It has long been the custom to assert that the British navy holds command of the sea. Sentimentally and in peace this may be admitted to a certain degree, for no one then is likely to dispute it. From the naval and strategical point

of view this is not the case, for no fleet has technically and actually the command of the sea so long as there is another fleet in existence to challenge or oppose it. This has been exemplified admirably by the situation of the German fleet from the beginning of the war to the end of October, and to a less extent by that of the Austrian fleet. It is essential to the integrity of the British Empire that the British navy should be able to assume the actual command of the sea whenever circumstances demand. It can only do so by virtue of its superiority; and, for this, ships and men and discipline, combined with the sense of comradeship between officers and crews, are indispensable. At the time of the Boer war Britain was able to exert a virtual command of the sea because she was strong enough to assure the safety of her transports, and at the same time produce a fleet superior to any naval combination likely to be brought against her. For this among other reasons, no such combination was attempted, and British naval supremacy, though envied and hated, was unchallenged. Then powerful fleets of battleships and fast cruisers were disposed where they could guard our shores most effectively, and other cruisers patrolled the trade routes upon which our food-carriers went back and forth. It was simply patrol work, for our then enemy had no fleet at all. But the British navy was where it was wanted, and was ready and anxious to do whatever was required. At one time it appeared as if the imperial sender of a certain telegram would have found that to his cost.

Now Britain's naval superiority has been challenged under conditions of surpassing gravity, and at the time of writing the fleet is justifying its existence alike by the silent pressure it is able to apply to the German fleet, and by its readiness to show that it is equal to the other and grimmer purpose for which it was created. The bulk of the naval fighting, it is believed, must be between the British and German fleets. On the German side, as long as Italy remains neutral, the only possible assistance is that afforded by the small Austrian navy, which, however, is too far away from the German fleet to be of any actual use to it, and is not considered strong enough, on the ordinary bases of peace calculations, to hold its own against the French navy—nearly all the vessels of which are in the Mediterranean—particularly when the last-named is reinforced by that portion of the British Mediterranean squadron understood to be operating with it. The other French cruisers are in the Atlantic, assisting the British vessels in oceanic police work. The value of the Austrian fleet continues so long as it is a fleet in being, and as such it must receive the watchful attention of British and French warships of sufficient number and power to induce it to remain in port, or defeat it utterly if it should venture into the open sea.

Until the fighting value of the Austrian fleet is destroyed by the allies' combined fleet, the latter is restricted in its activities by the duty of incessant watchfulness over a limited area, and is not wholly free either to suppress a German raider or warship, or to go to strengthen, if need be, the British fleet operating in the North Sea, or the British and French warships cruising about the Atlantic and the Channel for the protection of shipping and the capture of ships belonging to the enemy. Inactive though it may have been, except when individual vessels have emerged from their retirement, usually to their detriment, the Austrian navy has nevertheless exerted a somewhat inglorious influence upon the Anglo-French command of the sea in the Mediterranean.

In the North Sea a somewhat similar situation prevails, though on a vaster scale. The German fleet, which, according to flamboyant German writers, was to sweep the British fleet before it at the command of the self-styled admiral of the Atlantic, and according to more or less official German despatches—likely to make Baron Munchausen and the celebrated Ananias blush for their reputation—achieved by the beginning of September the flight of the British fleet, and the loss of some of its best vessels in the North Sea, to say nothing of wrecking a few destroyers off the Golden Gate of San Francisco—this detail perhaps being considered *à propos* of the Panamá Exhibition to be held there next year,—this German navy, thanks to British naval pressure, has been waiting, sheltered behind the Heligoland fortress, a propitious moment for initiating this programme. In such encounters as have taken place up to the end of October the German fleet has had the worst of it. The British navy can play a waiting game also, as its history proves, but it is not necessarily inert. It has always been famous for its daring raids and cutting out expeditions. The engagement off Heligoland early in August was of this character; and, though no prizes were secured, or perhaps wanted, the Germans suffered heavily enough to justify the result being claimed as a British victory. The net result was that Germany is the poorer by two or three cruisers and several destroyers. With the exception of the few German cruisers and commerce destroyers which have still to be accounted for, the British navy acquired the virtual command of the sea; and when these vessels have been silenced it will hold the actual command of the sea, for the ships on cruising duty can see to that while the vessels in the North Sea continue to hold the German navy in check. The German fleet, moreover, has to operate in the Baltic Sea against the Russian Baltic fleet, which, although not very powerful, is not to be despised, and may be relied upon, except when the Baltic is frozen, to aid the Russian land forces operating in the East Prussian provinces along the Baltic. It will be interesting to see whether either navy will make

use of ice-breakers during the winter to enable them to operate.

The fighting power of the German fleet is formidable. Its delay in coming out for battle caused an unfortunate tendency to be adopted in many quarters to attribute its masterly inactivity to cowardice. This is the last thing of which the German naval officers should be accused. We in this country cannot pretend to know the reasons for Germany's naval inactivity. It may be based on the glaring discrepancy between the numbers of her own fleet and those of the relentless foe waiting with grim persistence and a watchfulness unrelaxed by day or night to greet it, and determined to blow most of it out of or under the water. It may be based on strategic reasons, in the belief that it can best support Germany's campaign in France after a certain unrevealed aim has been attained, in which case Germany's difficulties will cause a change in the programme. It may be founded on a desire to use the fleet as a last resource when the gathering strength of the British Empire is brought to bear. It may be that it is intended, in whole or in part, to enter the Baltic, attack the Russian navy, and advance toward Petrograd. It may be that it is to be held in reserve as an evidence that Germany is still able to strike when events begin to shape themselves toward bringing peace nearer. It may be Germany's last card in the great game of diplomacy as a substitute for the rattling of the broken sabre. These are all suppositions, every one of which has found expression at one time or another in the German press; but they do not allow for any alteration which the British navy may make in the situation. They are, however, all founded on the knowledge of Britain's naval power. There is also the recognition of the human, apart from the material, efficiency of the fleet, the former being a factor which is as evident in the comradeship of officers and men as that comradeship is conspicuous by its absence from the German navy, where German disciplinary methods prevail.

In ships, in guns, in personnel, the British navy is superior to those of Germany and Austria together. Prior to the introduction of the modern Dreadnoughts it was not customary to place more than four of the biggest guns in any one ship, and, in addition to these, four or five descriptions of smaller guns were carried. The Dreadnought was designed to carry ten big guns, and most of the smaller type were eliminated. This became known as the all-big-gun type of vessel, the smaller guns retained being intended to repel vessels making a specialty of torpedo attack. The design was quickly improved upon, and super-Dreadnoughts were soon produced. The advantage of the all-big-gun ship, of whatever type, is that it is able to maintain an engagement at far longer range with its principal armament and do more damage than was possible with the best battleships of the pre-

Dreadnought era. The naval battles in the war between Russia and Japan were held by experts to have demonstrated that a vessel carrying a greater number of heavy long-range guns is superior to any other type of battleship. The big ships' volleys in that war, and especially in the final naval battle, were largely at distances ranging from two thousand to four thousand yards. Britain secured a lead with vessels of the Dreadnought type, and by virtue of her vast resources has been able to maintain that lead, notwithstanding Germany's frantic efforts to profit by her example, build Dreadnoughts, and lessen the discrepancy between her fleet and that of Britain. Germany, however, has no battleships to compare as equals with the ten British and best super-Dreadnought battleships; each side has three under construction, of which the British trio will probably be ready first.

The secrecy of naval movements is as important to-day as it ever was, perhaps more so. This is surprising to some on account of the many inventions for improving communications, particularly wireless telegraphy. If, however, the public can be prevented absolutely from using wireless, and the invention is retained entirely for State purposes, the authorities can impose that secrecy which is so necessary to the successful development of the campaign. The whereabouts of the British ships are known only to the Admiralty and the King, and their movements are recorded daily. So numerous is the British fleet that out of the five hundred odd vessels—including non-combatants—of which it consists, it is considered to have between three hundred and four hundred in the North Sea waiting to settle accounts with the German fleet, which has scarcely half that number. These totals include ships of every description—battleships, battle-cruisers, heavy armoured cruisers, protected cruisers, light cruisers, scouts, destroyers, torpedo-boats, submarines, mine-sweepers, and repair-ships.

Virtually, at least half the navy is always in commission; the balance includes the ships in various stages of readiness to be commissioned and the ships under repair. With the exception, perhaps, of the last, it is little more than a matter of days, of a week or two at most, to commission and place on a war footing every available ship in the British navy.

In regard to weapons and armour, it must be remembered that a warship is a floating gun platform or fort, and that the armour is added to protect that ability to keep afloat and change her position upon which the effective performance of her duties very largely depends. The armour of the hull extends from the upper deck to four or five feet below the normal waterline; there is also a thick armoured deck, which, for most of its width across the ship, is higher than the waterline, but slopes considerably at the sides to join the lower edge of the armour.

The coal-bunkers are arranged to afford a further element of protection to the engine and boiler rooms. The upper deck is also armoured, and extends practically the whole length of the ship and across it to the upper edge of the armour-belt. With the exception of the turret guns, most of the weapons are in the space thus protected. The barbettes of the big guns have armour about a foot thick, and revolve according to the direction in which the guns are to be fired. The fighting effectiveness of a modern battleship depends upon the number of the heaviest guns which can be brought to bear at the same time upon any given point. The statement that some vessels are able to train all their big guns at once in any direction is incorrect; no super-Dreadnought has been designed in which this is possible, nor is it likely to be while steam is the propelling power and more than one turret are carried at the same level. Internally, to save weight and reduce the risk of fire, steel replaces wood wherever possible. The big guns are arranged in the latest ships to fire on either broadside, and the end-on fire has been increased by the introduction of the superposed turret, which enables the guns of the higher turret to be fired over the next turret. An end-on fire of six or eight great guns is thus arranged when the middle turrets are *en echelon*, and of four guns when the turrets are arranged on the centre line of the ship. The guns themselves range from 12-inch in the Dreadnought to 13·5-inch in the *Orion* and subsequent vessels, excluding those under construction. Where the firing of the guns of one turret is interfered with by the position of another turret, a system of electrical danger-signals operates automatically. The heaviest guns in this country are 15-inch guns of 45 calibres, to be placed on the *Queen Elizabeth*, which is to be finished next year, and these are capable of throwing projectiles weighing eight hundred and fifty pounds to an effective distance of over ten thousand yards. Experiments and calculations have shown that the 12-inch gun of 40 calibres can hurl a projectile weighing one thousand nine hundred and fifty pounds to penetrate at that distance Krupp cemented armour even if it be eight and a quarter inches thick. This, however, is far exceeded by the new 15-inch gun, which at that range, and with a similar projectile, can penetrate the same kind of armour of eighteen and a half inches thick. In the never-ending contest between the gun and the armour, the honours lie with the gun at present. The effective range of the guns is limited by human eyesight, aided by telescopes, for there is not much use in blazing away without knowing whether the target is touched. The risk of missing the target increases with its distance; but such is the accuracy of modern guns, and so careful the training of the gunners in most ships of the British navy, that an effective range

of from three to five miles, or even more, is expected in the next engagement.

This accuracy is attained by using a number of devices for range-finding. The exact power of the weapons and of the explosive and the velocity of the projectile are known, and a calculation of the angles at which the guns are to be elevated at the moment of firing should ensure the projectiles striking where required. The finding of the range is done by the officers or spotters in the fire-control stations high up the masts, whence they signal electrically to the men who have to lay the guns at the precise angle each gun shall take. Then at the right moment a button is pressed in the conning-tower, and instantly a discharge follows. Modern practice favours the discharge of the big guns in salvos, instead, as is often thought, of the big guns in each turret being loaded and fired irrespective of the others. When a salvo is fired it is comparatively easy to see whether the target has been struck; and if it has not, the elevation of the guns is altered accordingly. The simultaneous firing lessens the inconvenience of the smoke from the most windward gun interfering with the sighting of the others. This is an important point, for when once the range has been ascertained the big guns may be fired at intervals of half-a-minute. The accuracy of these immense weapons is such that it can be calculated where a broadside will fall within a space of less than two hundred yards even at a range of five or six miles. If, then, the range be determined accurately, it is very evident that those foreign ships which receive the attentions of the best shooting ships in the British navy will experience the proverbial bad quarter of an hour. Of course, neither the attacked nor the attacking ship would be standing still, except that the former might be in the event of a surprise, and the fire-controllers or spotters have to take into consideration the speed and direction of their own ship and that of the enemy, to allow for the time of the flight of the projectiles, and train the guns so that the projectiles will not miss.

All the guns in the big battleships and cruisers are worked by hydraulic machinery, including the elevating and loading, though hand-power is provided if the hydraulic machinery be disabled. In all classes of vessels hydraulic machinery is used to save hand-labour in every conceivable way.

Torpedoes, which have already figured prominently in the war, are fired from tubes either a short distance above the water or submerged. The average torpedo is about twenty-one inches in diameter, weighs about twenty-eight hundred-weight, and is about thirty feet long. Improvements have been made in these weapons, as in all other branches of war, and details of the latest kinds are not available. What is described as the decisive battle-range of the most powerful modern torpedoes is roughly eight thousand

yards, though the torpedoes are capable of travelling a great distance farther before their propelling power is exhausted. They do not make their journey through the water by reason of the impetus given them when discharged from the tubes, but are driven by their own machinery actuated by compressed air, and are fitted with appliances which cause them to return to their correct depth and course if anything should happen to deflect them. The 18-inch torpedo, which was the most destructive up to a few years ago, had an explosive charge of over two hundred pounds of gun-cotton in its head, and still had a speed, after travelling more than three miles from the discharging ship, of twenty-seven knots. The newest torpedoes, of twenty-four inches diameter, carry considerably more than three hundred pounds of gun-cotton, and even after travelling nearly five miles under water, and gradually losing speed, are still able to progress at the rate of half a mile a minute. The chief protection of ships against torpedo attack is the rapid fire of the smaller guns, and the big ships have in addition steel torpedo-nets, which are hung at the ends of booms some distance beyond the sides for the greater part of their length. A submarine can be sunk by gun-fire; and the course of a torpedo, when betrayed by the bubbles which rise to the surface, may at times be deflected by the lucky explosion of a heavy shell close by it and some feet under water. The recent loss of a German submarine in the North Sea, when a British cruiser shot away its periscope, and thus obliged it to come to the surface, then blew away its conning-tower and sank it, is a case in point.

The direction of a fleet in battle will be managed from the conning-tower of the admiral's ship. In an engagement at long range the navigating officers will probably have their places on the bridge at first, but this position is too exposed to permit of its being occupied for long during an action. Under the flying-bridge there is a small circular apartment known as the conning-tower. This is very heavily armoured, and protected above as well. A narrow slit about a couple of inches wide is made round the tower, through which the officers inside can see what is going on around them. The tower contains the steam steering-wheel, compasses, and various means of making signals to other ships, and of communicating electrically and by telephone with every part of the ship. With the navigating officers in the conning-tower, others in the armoured fire-control stations, others attending to their duties elsewhere, and the men behind the armour of their guns, in the magazines, working the ammunition hoists, or in the engine-rooms and stokeholds, a modern battleship may glide into action with perhaps not a man visible to the enemy.

The most remarkable features of the present

war are the employment of the numbers of immensely powerful big guns already mentioned, of submarines and aerial craft, and of wireless telegraphy. Since submarines were last employed in warfare they have undergone such development that there is no more comparison between the submarines of the past and those of the present than between Noah's Ark and the latest super-Dreadnought. They are propelled by their own engines, usually of the internal combustion type, have periscopes which enable them to find their way even when submerged, carry several torpedoes, and are able to travel hundreds of miles under their own power whether beneath or at the surface of the water. When all their torpedoes or fuel are exhausted, they return to the 'mother-ship' for more. It is anticipated that the worst enemy of the submarine will be the aeroplane, especially in clear weather. It is easier to see a considerable distance beneath the surface of the sea from a height above it than from near the surface, and scouting aeroplanes, if not flying too high, will be able to detect and report submerged submarines which would be invisible to ships unless the periscopes happened to be seen.

The latest types of submarines and some aeroplanes carry guns specially designed to meet their requirements; those of the submarine are attached to a platform which is taken bodily into the vessel before submersion. Both carry a wireless outfit. The advantage of the seaplane over the ordinary aeroplane is that the former can rest on the water when not in flight. The danger of aeroplanes or airships dropping bombs on an enemy's vessels is held to be exaggerated. It is exceedingly difficult to drop anything to hit a given mark from a height of five thousand feet, which is the theoretical aerial safety limit from rifle-fire, though the experiences of aeroplanes during the land fighting have shown there is not much danger at from three thousand to four thousand feet; while if airships descend sufficiently low to make sure of hitting so small an object as a ship must appear from a great height, they will probably be detected by the searchlights by night and lookout men by day, and shot to pieces by gun and rifle fire before inflicting any damage.

THE TWO GLORIES.

BEYOND the sea in glory sinks the sun,
Weaving a pathway of his golden rays,
'Mid glamouring veils of twilight-woven haze;
And when his western couch at last is won,
And all his lone, magnificent journey done,
The Night, with velvet tread and sweet delays,
Immaculate from her home in starry maze,
Brings lovelier glory than the glory gone!

Death is a twilight 'twixt two glorious days,
Whereof with passionate choice we cling to one
As if no gleam had from another shone;
But when we mount the silent, starlit ways
God's glory bursts upon the cloudless gaze—
Glory which lived ere life had yet begun.

PERCY SCHOFIELD.

Chambers's Journal

SEVENTH SERIES

STRANGERS IN THE LAND.

By Colonel AYMER MAXWELL.

[It is with deep regret that we have to record the death of Lieutenant-Colonel Aymer E. Maxwell, son of Sir Herbert E. Maxwell, Bart. of Monreith, Wigtownshire, who was killed in action at Antwerp on 7th October while in command of the Collingwood Battalion of the 1st Naval Brigade. Colonel Maxwell had not leisure to revise this article in proof before leaving for the front.]

FOR man to intervene in Nature's arrangements without duly weighing the results is always likely to be a hazardous experiment, and has often been attended by consequences as unexpected as they are unpleasant. Early settlers light-heartedly turned down rabbits in Australia, and now the whole desert centre of the continent is a vast rabbit-warren, and the farmer has to wage unceasing warfare against the coneys, or he would be eaten out of his homestead in a single year. A later generation imported weasels to keep down the plague of rabbits; but these fearless little hunters could not cope with the amazing fecundity of their quarry, and have only served to bring to the verge of extinction interesting forms of wingless birds peculiar to the island-continent. In Victoria, foxes, whose staple food in our own country is the rabbit, were at one time procured and turned down to combat the growing evil; but the new-comers, under changed conditions of life, soon developed a marked partiality for an easily obtained diet of lamb, neglected the rabbits, and became a most unwelcome feature in the life of the colony.

Even apart from such practical considerations, the naturalist of science—as opposed to the field naturalist—will usually be found to be much averse to any attempt at adding strangers from other lands to the roll of our native fauna. He has a clear survey of the natural distribution of species mapped out in his mind, and objects to any infringement of his well-ordered scheme. To him the most beautiful foreign bird which can be induced to make its home among us remains only an undesirable exotic; it offends his delicate sense of the fitness of things; and while he would use every means in his power to preserve and protect the fauna assigned to these islands by the hand of Nature, he sternly sets his face against any endeavour by the hand of man to add to their number.

This is doubtless a correct view from the standpoint of science; but to the ordinary mortal—incapable of drawing such nice distinc-

tions—there is something peculiarly fascinating in the endeavour to induce some foreign species to become a permanent resident in the land, to watch over and care for the stranger's first efforts to adapt himself to his new surroundings, and, finally—if success crowns the undertaking—to see the new-comer increasing his numbers and spreading his range, thriving under natural conditions without adventitious aid.

So wide a field for conjecture and suggestion is offered by this interesting question of the possible acclimatisation of species that it becomes necessary to restrict inquiry to one branch only of a wide subject if the matter is to be comprised within the limits of an article. Let us, then, confine our attention to members of the bird-world in their relation to sport.

Our indigenous game birds are few in number, the gray partridge, the grouse, the ptarmigan, the blackcock, and the capercaillie completing the list; and of these the last-named can no longer claim to be of pure native descent, the last of the original stock having been killed more than a century ago. For forty years the great cock of the woods was unknown in the country till the Marquis of Breadalbane imported a few from Scandinavia. From these foreigners the whole race which now inhabits the Highlands of Scotland is sprung, and that they have thriven well the fact that over fifty brace have been killed in a day should serve to place beyond doubt. Some attempts have been made to introduce capercaillie into the woodland districts of England, especially at Woburn Abbey in Bedfordshire, where seventy cocks and one hundred and fifty hens were turned down in a few years, and where a few pairs nest every year in the extensive woods.

The old game-books of most country houses have a column devoted to the quail, and it is sad that we may no longer expect to add this interesting variety to a day's partridge-shooting, for a gluttonous generation has decided that it is better to eat the quail than to encourage his presence as a visitor, of interest as well to the naturalist as to the sportsman. And so, when the great spring migration of quail sets northward from Africa and Asia Minor, the whole seaboard of the Mediterranean is beset by miles of nets, in which millions of quails are taken, to be subsequently fattened in darkness and cap-

tivity to meet the demand of the dwellers in cities. The few that escape this persecution spread over northern Europe, but only a scanty band of stragglers, dwindling in numbers every year, now reaches these islands. Nor could sportsmen in this country do anything to mitigate the evil; for, while quails turned out in this country would do well enough for a time, the deeply implanted instinct of migration would eventually bid them turn their faces southward, only to swell the catch of the Mediterranean nets on their return journey in the following spring.

The Californian quail would be a very desirable addition to our game birds; but, though it is hardy and exceedingly prolific, difficulties of food-supply and an ineradicable disposition to migrate seem to make it improbable that this beautiful tufted quail will ever obtain firm foothold on our farms, though it has been successfully introduced into New Zealand. In the only attempt which came under the writer's personal notice, the few pairs thrived exceedingly on the light arable soil of one of the Mulls of Scotland's western seaboard. After a few years their numbers had increased to close on two hundred. But one day the whole race began to gather together on a slope overlooking the sea; here they remained for about a week, and then took flight in a body, never to return. In similar fashion, many attempts to introduce the Virginian colin have always ended in failure, although the 'bob-white,' as it is popularly called in America, has often been known to breed with us after liberation.

The study of bird-migration is yet in its infancy, and many and intricate are the problems therein which await solution; but it seems certain that the habit of migration has become through long ages so much a part of the very life of those species whom questions of food-supply originally forced to change their quarters with the seasons, that no assurance of comfort and ease in a land of plenty will induce them to abandon the instincts of their kind. Thus any attempts to introduce a species of migratory habit seem foredoomed to failure, though all practical conditions for successful existence may be present.

Game-preservers now have their attention largely occupied by the question of pheasants. The pheasant is by far the most successful bird of chase which has ever been introduced; and though millions are now annually reared artificially to furnish our winter covert shoots, he has shown himself able to hold his own in a wild state. History has no record of the first appearance of the old English pheasant in our woodlands; early Phœnician traders may have brought this native of Asia Minor to our shores, or his arrival may be attributed to the later times of a Roman occupation. In any event, we cannot gainsay him a respectable antiquity as a denizen

of this country, for, in a bill of fare under the Saxon kings, *Unus phasianus* is assigned to the canons of Waltham Abbey as the alternative to a brace of partridges in the daily commons. It was not till the middle of the eighteenth century that the ring-necked pheasant was brought from China to challenge, and eventually to oust, the black-necked bird from pride of place in our woods. The two interbred freely; but the ring-necked proved the stronger breed, and became the predominant strain in the ensuing race, a true specimen of the black-necked pheasant being now rarely met with.

There are no less than sixteen varieties of pheasants, all closely akin to the original common pheasant, which will freely interbreed and produce fertile offspring. Several of these have been imported in large numbers, and have proved very beneficial in improving the native breed both in size and health, the first cross especially being usually a far larger bird than either of its parents. Among these recent introductions are the Mongolian pheasant, the finest of all the colchican strain, a handsome and hardy bird, and of good repute for the table; the Japanese pheasant (*versicolor*), with distinctive plumage of deep bronze-green, a variety till lately much thought of, but now only considered useful for producing a splendid first cross when mated with the common or Chinese variety; and the Prince of Wales's pheasant, brought from Afghanistan by Colonel Saunderson ten years ago, and successfully acclimatised by him on his Hampshire estate. Closely resembling our common pheasant in appearance, this last variety is easily recognised by the distinctive light colouring of the wing-coverts; as a prolific member of the family, a strong flyer, second to none for the purposes of sport, and as the pheasant best able to hold its own under adverse climatic conditions, this sub-species deserves consideration. Of the other kinds of colchican pheasants which have not yet been tried in this country, the Oxus, Yarkand, and Hagenbeck's pheasant seem worthy of a trial in our coverts. The eventual result of the successive introduction of these different varieties will be the evolution of a type of pheasant which will probably be harder than the older kinds, and which will preserve some traits of all its parent stocks.

Of pheasants which will not interbreed with other species—or at least not produce fertile offspring, which amounts to the same thing for all practical purposes—the splendid copper pheasant of Japan, the giant Reeves pheasant well known to us in our aviaries, the *monaul*, and the Chinese *impeyan* seem worthy of the sportsman's notice. The first of these would do admirably in our coverts; the Reeves has proved a great success in the wilder parts of the Highlands, and deserves a more extended trial in many of our mountain districts; while the other two, although somewhat difficult to obtain, are

noble and striking birds, inured to a cold climate, and seem well adapted for the northern parts of the kingdom.

In the world of partridges, the Frenchman has proved a valuable addition to our native stock. Long persecuted by gamekeepers, it is now recognised that the redlegs in no way interfere with the gray partridges, and, further, that they will thrive on barren and waste lands and on heavy clay soils where the native bird cannot contrive to do aught but eke out a precarious existence. Many foreign varieties have been suggested by naturalists as suitable for introduction, but few have been found to repay the trouble of importation. For the purposes of sport, a variety would be most acceptable which would thrive on our waste-lands, especially in elevated and exposed districts. For this reason the mountain partridges of other countries can be recommended as fit subjects for experiment; and it might possibly be found that one of the handsome lerwa partridges, or even a member of the

family of snow-cocks—kings of the partridge race and dwellers on the mountains of Asia—would be content to make its home with us.

Of the grouse family, the hazel hen—a plentiful species throughout eastern Europe—would make a welcome addition to the ranks of our native game birds. Akin, as it is, to the sage grouse of the New World, we have no member of this genus resident in Britain. This forest-dweller has the reputation of being the best game bird in the world to eat, and finds its natural habitat in large stretches of woodland.

These few examples may well serve to show what a wide field for enterprise in this direction is open to both the sportsman and the naturalist. Patience and a long purse are the two requisites for success; for the cost and difficulty of safely transporting birds from distant lands, alive and in good health, are easy to underestimate, and often a boy with a catapult or a poaching cat may bring an interesting and arduous experiment to an untimely close on the eve of success.

THE BRIGHT EYES OF DANGER.

CHAPTER III.—IN WHICH I TAKE THE NORTH ROAD.

I AM Edmund Layton, second son of Sir John Layton, who was Lord of the Manor of Durrinston in Westmorland, where I was born. There are fierce and troublous times here in Southern India, far from home, and it may very well come to pass that never again shall I set eyes on the fells and dales around my birthplace, or hear again the voices there that I love. It may be written that these things are lost to me; and if they are, I pray that I may lose them in the way I wish, like a soldier, my sword for King George—I, who once did His Majesty a wrong. So I set down here, as clearly as I can, the narrative of how a chance current may press, full hardly, an honest enough swimmer in this passing Affair of life.

I was a slip of a youth, twenty-three only, on a September morning in 1745, when I threw boot over saddle and set out for the town of Edinburgh from Durrinston. It was very early, for I remember that I dressed by candle-light, and as I rode off, and looked back at Durrinston, the thin daylight had just begun to awaken the windows of the old house and set them blinking. There had been a touch of frost, and the morning air, sweet and keen, caught my breath as I put my horse to the North Road.

My business in Edinburgh lay with a Mr Peter Scott, who was a Writer to the Signet there. It concerned a small property in Liddisdail that had fallen to me from my mother, an Elliot of the Border.

I rode leisurely on my way, for the matter entailed no great haste. Further, this was my

first long journey from home, and I mightily enjoyed every turn of the road; the great green whale-backed Westmorland hills on either side sloping down to the clear streams in the valleys, the morning shadows curveting and making play on them; the sun rising higher behind the hills as I rode on, melting the little mists that clung like lace round their shoulders; all around me birds whistling and whistling; and the blue smoke curling from the houses up near the folds on the hills, where the hill-folk were setting about their day's business. The air was like wine, so that I sang out of sheer light-heartedness. I had four rare things in combination: careless youth, health (I could wrestle any lad of my weight in Westmorland), a goodly number of broad pieces in my purse, and a well-bred horse under me. I have never felt so free from care since.

I rode on towards Carlisle, up the valley of the Eden, and in the evening reached the red old city that lies among meadows and clear streams. There I put up at 'The Crown and Mitre,' where, to show my experience, I damned the hostlers like a lad of spirit.

Next morning the landlord, seeing me at the yard gate, well breakfasted and in the saddle, civilly asked my destination. I told him that I purposed visiting Edinburgh.

'Th' folk say that t' Yoong Pretender, as they ca' him, will ha' ta'en Edinburgh afore tha' sees it,' said he. 'But I know nowt about it. Traveller's tales, belike! But haste tha' safe back, sir.'

He ran after me to recommend 'The White

Horse Inn' in the Canon Gate in Edinburgh; a place, he said, good for man and beast, and kept by a kinsman of his wife.

I held on by Netherby, new worlds at every turn of the road, and thence eastward into Liddisdail. There I found much to interest me vastly, for this was the first time I had set eyes on my little inheritance of Darehope, a house that lies sweet and sheltered in a dip of the hills, a few farms along with it, by the sound of the Hermitage Water, begirt by great fells, with a network of streams running down their silver ladders to the valleys. There I spent two days looking over the place, making my tenants' acquaintance, discussing accounts and such like matters with the steward. I was loath to leave, for the place and the folk were pleasant. It came about afterwards that I was to spend the most of my married life there, and there my brave wife waits me. Here, many cruel leagues away, how often have I been fain for a sight of the gray house and the green hills of the Border, and for the time when I may have been back, with my work here honourably done!

On the forenoon of the fourth day I was riding along a road, bordered by narrow strips of green, beyond them the uplands slanting to the high tops. One of the hills on my right, a shepherd told me, was called Coomb Edge. I remember a wholesome stream that plashed alongside the road. The day was hot. I was tired and dusty, and, seeing a still pool, I was tempted to bathe. So I tethered my horse amidst a clump of trees a little way off, stripped, and plunged into the pool, deep, but so clear that I could see every pebble at its bottom, and the quick tails of the trout steering over them. I could swim like an otter, and went round and round the pool in great content, when I heard a sudden shout, and looking towards the trees on the bank, I saw a man on horseback come galloping off the road, straight across the little field to the place where I had left my horse and clothes. He shouted again to me, waving his hand, and I came out, naked and dripping in the sun, not in the best of tempers at being interrupted, and in a wonder at his excitement.

He had reined up and dismounted in a great hurry before I reached the bank, and was pointing with his riding-crop to the slopes on the other side of the road.

There, crouching like hares as they ran behind rocks and bushes, I saw a couple of ill-conditioned-looking fellows.

'The nick o' time, I warrant ye,' said the horseman. 'Another couple of minutes and the rascals would have had your saddle-bags as empty as a drum. They were just beginning to *rype* them when I cam' roun' the corner. It's little use trying to catch them, though they weel deserve a man-handlin'!'

He turned and gave a great bellow towards the running men that echoed among the hills, and sent the thieves quicker on their flight. I thanked him profusely, and made haste to see that my belongings were safe. Luckily the knaves had not found my purse, which was in my coat pocket. They had only begun to search my saddle-bags, and had been so suddenly disturbed that they got nothing.

'It would be an ill thing, indeed, for me if I made for Edinburgh with an empty purse,' I said. 'You could have shared mine,' he said instantly.

I had heard the Scots were 'close,' as the saying went; but here was my first experience. I made haste to thank him for his good-hearted offer to a stranger.

'No that it would set ye up much,' he went on, with a laugh, his brown eyes a-twinkle. 'I see by your horse that you have a longer purse than mine. But if you are for the road, forgi'e me for saying that ye'll be none the worse for the putting on o' your clothes.'

He had an engaging smile, and his voice rang kind and honest.

'Are ye acquaint with these parts?' he asked.

'Tis my first time across the Sark,' I answered.

'I thought ye were a bit off your road, if ye are for Edinburgh. I have been over the Border on a fashious business o' some sheep at Kielder-Head Moor, and now am making for Edinburgh. I ken a short cut to the Hawick turnpike, a drove-road through the hills,' he said.

He was Walter Irving, the son of a Buccleuch tenant in Roxburgh, he told me. I gave him my name.

'I press my company on no man, Mr Layton, laird or tinker,' he went on; 'but ye can see by what happened, when ye were in the water there, that there are gentry along the road that I'd rather see the backs o' than their faces. So for safety, let alone company, if ye are willing, we might tak' the road together.'

This was entirely to my mind, for I was never a solitary, and in a few minutes we were riding slowly along the road past the Knot o' the Gate. I had time to take a look at my companion. He was tall and good to look upon; well apparelled according to his degree, from his broad blue Border bonnet to his riding-boots; and, so far as I saw, carried no arms. Striking the drove-road to the left that he had spoken of, we came into a lonely country, with no signs of man but the sheep-tracks, and shepherds and their dogs here and there, mere crawling specks up on the hillsides. We had ridden slowly for an hour or more, and at the crest of a steep brae, halting to breathe our horses, we fell a-talking of our destination.

'There will be blood on the Edinburgh causey soon, I'm thinkin'!' said my companion. 'Are ye'—— He broke off suddenly, and looked at me with narrowed eyes.

'You mean, am I for fighting? It depends,' I answered warily, for I knew nothing of his politics.

He said nothing, but began to whistle an air, looking straight between his horse's ears. It was the tune of a doggerel rhyme, beginning:

*From Yetholm braes to Tynron Doon
The King's redcoats in ilka town.*

The jingle was one of the many that had been in vogue at 'The Fifteen,' and now, revived, was wandering over the Borders. It had reached the Cumberland and Westmorland fells and pikes, so that I knew it. I said nothing, but took up the lilt at the third line.

'Ah! Ye have a nice ear for the music, Mr Layton,' he said, and looked me fairly in the face. I stared back at him, both of us looking so solemn and unreal that we broke into a sudden peal of laughter.

'I am for King George, like my father and all Buccleuch's tenants,' he said, giving his thigh a slap; 'but I'm for Edinburgh on decent business. Lairds and fire-eaters can fight when plain work-a-day folk canna. No shoulderin' a musket for me! Forbye, there are gossips sayin' that the Edinburgh folk are waitin' for the cat to loup. They are thinkin' more about their trade Guilds, and wha's to be Deacon, what profit they'll win or lose if the Stuarts gain the day, and sic like huckster things, than the crown o' Britain. Maybe they are wise in their generation. And if the Provost and the rest o' them can keep their canny skins whole, I dinna see a call for Walter Irving to shove his head in a noose. I'll never raise a finger one way or the other, unless I'm fairly forced; but in the meantime I'll ape some o' my betters—that is, say little, and go about my business. I seem to mind on your name, sir.'

'I own Darehope in Liddisdaill, and my errand in Edinburgh concerns it. I am a Layton of Durriston.'

'In Westmorland?'

'The same.'

'Then if you are for the white cockade, you'll be the first o' the breed.'

'My father was with his regiment in "The Fifteen,"' I said coldly; but he held up his hand as he saw the blood rise in my face.

'I only said that to rouse ye, sir,' he said, and laughed. 'I ask your pardon. Besides, ye whistled the bit tune ower weel for a Jacobite. No offence meant. I see ye are on my side o' the house.' He held out his hand for me to shake, his good-natured smile inviting friendship. I took his hand, and from that moment we made the journey together in great amity.

There was no gainsaying Walter Irving's good humour and shrewdness. He may have been my inferior in rank and station, but he never jarred on me through any lack of breeding or, in his own phrase, 'aping his betters.' Tall, dark-

eyed, lithe, with a dare-devil handsome air and carriage, he would have been a noticeable figure in any company. He spoke the Lowland Scotch pleasantly, and had a store of legends and tales of the places we came to that made the hours pass quickly. Indeed, it would have been a duller journey without him. Sometimes at nightfall, when the weather was good, disdaining the roofs of the country inns, we would light a fire, and, wrapped in our cloaks, sleep under the stars dreamlessly, till the cocks answering each other at dawn awakened us. He knew the ways of the wild things of the country-side, bird and beast, and many a good trout did he 'tickle' and land for our breakfasts. And often he would break into a song with a great mellow voice. Altogether, between his high spirits, his good looks, his resource and manifest cleverness, I own I conceived an admiration for him that grew as the days passed.

Walter's errand to Edinburgh took some time to discover. He hummed and hawed and reddened over it, until in the end a child would have seen there was little business (in the money sense of it) in his journey. At last, over an evening stoup of claret at a hostelry, he admitted that he had lost his heart, and that he was a-courting. He did not condescend on details, nor did I press him to. Sometimes I might rally him a little, when he would say, 'Ay, "Laugh last" is an old saying! Your time is coming sure enough!' a safe enough prophecy to a sprig in the early twenties, as I was then.

We got wind of the drift of affairs in the North now and again. Sometimes, perhaps, a traveller going southward, or it might be a wandering packman, would come our way. My companion was extraordinarily eager for news, and would entangle the sourest-looking wayfarer, if there was but the slightest chance of breaking speech with him. I could not but admire his skill and address. He had a faculty of half play-acting, a chiming with the mood and degree of the folk he met, that often was of vast service to him; and I remarked that although he contrived to engage all and sundry in conversation, and was as inquisitive as a weasel, yet he said very little regarding himself. I never knew a man who found out more from his neighbours and gave less in return in the way of information.

We put up one evening at the Old Forest Inn in the town of Selkirk, and there, resting after our day's ride, we saw a company of the King's soldiers, very fine in scarlet coats and yellow facings, stepping out briskly to the sound of the fifes and drums. The landlord of the comfortable house told us that they had been billeted in the town for a week; that there was great secrecy kept concerning events; but a sergeant, over a bottle, had told him that they were hourly expecting orders for the North, for the Jacobite army had fared better than most men thought. The Young Chevalier, he said (and this, as we soon

discovered, was true), had entered the town of Perth, where an advance-guard of his troops had proclaimed his father James and himself King and Regent. While there, he had got reinforcements—numbers of the gentry of Struan, the tenants of Athole, and a great many others—and was on his way south to seize Edinburgh. I was for pushing on post-haste, in order to arrive there before the Highland army; but Walter was all, as he put it, for being 'siccar.'

'Sir John Cope canna be far away, and I would as lief see the outcome between him and the Pretender before I take up my quarters in Edinburgh,' said he. 'I've heard tell o' the wild Hielanders. If Sir John gets into Edinburgh first, all's well; but if the Hielanders win the town, you and I might be as comfortable outside it.'

We finally decided that as neither of us was in the firing line, we would go on without forcing our horses, until we came within reach of Edinburgh, and could gather undoubted news of the fortunes of the Rising.

'If we keep our tongues quiet, at all events,' quoth Irving, 'they canna hang us;' and this was precisely the advice that Mr Peter Scott, the writer, gave me afterwards. So, without haste, we put the miles behind us, and, favoured by dry weather, travelled in comfort.

The days were shortening. It was nearing the middle of September; the harvesters, busy in the fields, as unconcerned as though no Highland rebels were marching south. Indeed, I found all through my ride through the Lowlands that few folk were inclined to take the Rising seriously.

One day, towards evening, Walter Irving and I had come to a rising moorland, brown and bare. There were no houses and no human beings in

sight, and presently at a fork in the road I was for one way, he for the other. There was nothing to choose between the roads. Both showed equal signs of hoof-marks. We stood pondering for a moment, when Walter spied a bird perched on a branch in a little knot of firs.

'See!' he said; 'we'll take the road he favours.'

We watched the bird until it saw us coming. It rose and flew off down the road to the left.

'Tis a magpie,' quoth Irving. 'One's a marriage, so they say;' and he turned his horse to the left road, with a smile and a nod to me.

We had not ridden more than a couple of miles when the road steepened to a high hill, and we were glad to draw rein. When we reached the top, the country spread out before us like a picture, green fields and woods, corn-stooks and the country-people's houses—a fair sight. In the distance was a great plume of smoke trailing in the wind over Edinburgh; the Castle held up through it like a huge fist; and, beyond, the shining sea and ships beating up the Firth. The scene moved me like a sudden burst of music.

Without speech, we both stopped our horses and looked.

The Castle, we discovered afterwards, was held for the King by General Guest, the governor; and, as we gazed, the boom of a gun, followed by another, split the silence, and rumbled away among the hills we had left behind.

This was the greatest city I had seen, and the sight of it, its smoke-clad height, the sudden throb in the air after the sound of firing, and the moving neighbourhood of the sea, all made up such a surprising sense of adventure and distance that my young blood fairly tingled.

(Continued on page 35.)

FINLAND IN WAR-TIME.

By Professor E. H. PARKER.

FOR a week after the spasmodic and intermittent declarations of war (say 1st August) it was impossible for any one to leave St Petersburg either by boat or train. At last, on Monday the 10th August, the visitors (mostly Americans) 'caught' in the capital found that a roundabout communication had been provided for them by way of Raumo in Finland and Gefle in Sweden; the boat was to run thrice a week—that is, passengers leaving by the 9 A.M. train from St Petersburg on Mondays, Wednesdays, and Fridays would catch the Raumo steamer on Wednesdays, Fridays, and Sundays. Gefle and Raumo being north of the intricate and well-mined Aland archipelago, the German fleet could not interfere. Parenthetically it may be observed that the fleet of fifty or sixty men-of-war which I saw at Reval on the 25th July would (supposing they

were properly constructed and manned) have been able under British captains to dispose of the whole of the second-class naval forces reserved by the Germans for Baltic uses; but it is doubtful whether the ships 'made in Germany' or even those built at St Petersburg (before British supervision was introduced) durst 'toe the line' with the Germans whilst under comparatively inexperienced Russian officers. Rozhdesvenski's fate in 1905 is ever before them, and they have scarcely got their new sea-legs 'to them.'

But to return. A second train left for Viborg only at 4.40 P.M. There were innumerable droshkies in waiting at all stations, Russian or Finnish, with the exception of Viborg itself, where we were surprised at 8.30 P.M. not to find a single conveyance or porter to convey our baggage to the hotel. It turned out that a zealous governor had, amongst his numerous

other war regulations, decreed that no stranger must be seen in the streets after nine o'clock. It was fortunate that delivery of our heavy baggage was effected by an hotel porter with a good pair of shoulders one minute before that fateful hour.

We had decided not to flee precipitately all the way to Raumo, but to spend a week at or near Viborg, in roaming amongst the lakes and canals of east Finland (Karelia), and our sudden introduction to Finnish life at Viborg after the happy-go-lucky Russian experiences at Pskov and Novgorod was striking. In the absence of other assistance, we put up at the Turistenhôtel Suomi, which, from its name—*suo* means 'marsh,' and *suomi* means 'marshmen' or Finns—and still more from its manners and customs, was evidently meant for the entertainment of natives only. The entrance from the street led to a lift and nothing more. The porter or liftman showed us two excellent and spotlessly clean rooms on the fourth floor; and when we asked for the office he took us down again to the second floor, where also was the dining-room. In the centre of this room was a long table stocked with innumerable dishes. Each guest walked up from time to time from his seat at one of the many small tables, spiked a sausage or a piece of meat, poured himself out a glass of *kvass*, milk, buttermilk, or tea, selected some cucumber, beetroot, potatoes, fish, cheese, or what not, and carried his own store of food to a table. Few words were exchanged even between persons who had come to eat in company, and the general sensation or 'atmosphere' was quakerish, solemn, and slightly depressing. At first we thought these pick-as-you-please dishes were merely *zakuska*, or appetisers; but it turned out that that was all the supper provided, so, falling back on rye bread, oatcake, and white bread, we made the best of it.

We had to imagine what the city of Viborg looked like that night, for we were not allowed to show our noses in the street at all, and of course our passports were at once demanded for police inspection. Viborg is really a charming and up-to-date little town, admirably served by a good electric-tram service, with transfers. All Germans and Austrians had been obliged to leave so soon as ever war was declared, and all English visitors previous to our arrival seem also to have thought it prudent to leave Russian dominions. I had got one hundred roubles for a ten-pound note at St Petersburg on the morning of our arrival, so on Tuesday the 11th I expected to get two hundred and fifty Finland crowns at the Finnish Bank in the Salu Torget, or Market Place. What was our surprise to find that all the visible bank staff consisted of females, and the intelligent young lady to whom I handed my ten-pound note promptly turned up the *kurs* of the day and handed me 252·75 Finnish, besides changing my rouble-notes at

a correspondingly good rate! At the Russian banks this operation would have occupied half-an-hour, and involved several entries and copies. She said it was ten—or was it twenty?—years since Finnish women had been entrusted with banking operations, and five years since they had been admitted to Parliament. I understand that within the past few weeks a woman has even been appointed 'stationmaster' at an important centre. It is true that many Finnish women are dour and masculine in look and bearing; many of them, however, are solemn and severe without losing their charm of femininity; the pretty ones are sometimes even frank, obliging (but only when asked), and attentive; yet they are never gushing, playful, or in the least light-headed. This particular hotel we stayed at was a temperance one; but in any case the landlady said, when we proposed to begin with a drink, that the Governor-General would not allow beer to be sold anywhere after nine o'clock during the war; and the mere suggestion of a glass of *vodka* was received with a horrified shudder (*vodka*, as it is often written, is the genitive case). Prices all round are absurdly cheap in Finland as compared with Russia. We preferred to take early breakfast in our own rooms rather than to stand up and pick a bit at the round table; we therefore ordered coffee, two eggs, white bread (black barred), and jam for two. A bounteous feast at one mark—that is, a franc—a head was supplied as follows: two pots of coffee, four eggs, four plates of jam, unlimited bread and butter. At dinner (eleven to five) we again went in for the stand-up affair. The price was one and a half marks. Not a word was said by the weird company present, and there was no attendance except to take empty plates away. There was on the table a tureen of good soup, besides any number of cold *zakuskas*, cucumbers, beetroots, salt-fish, sardines, ham, &c.; and there were also large dishes of chops and cutlets, besides huge puddings and cooked fruits. Accordingly, as these good things disappeared under the inroads of successive determined but silent guests, the young waiting-girls took the dishes away and brought them back refilled. Finally, the same thing happened at supper (5 to 9 P.M.). At first we did not fancy the plan, but now we rather like it, for the cooking is excellent.

The Finns are an exceedingly go-ahead race. Expensive machinery, liberal lifts, telephones, and various electrical and other modern conveniences are met with on all sides in the least expected places; but apparently these same Finns have found that the ultimate result is worth the initial cost. It is extraordinary how much in the way of public works and services they manage to achieve with a total revenue of some seven million pounds a year. Public instruction is extremely effective, and not only is education compulsory, but neither man nor woman can marry unless a paragraph chosen

and submitted to them by the parson is not only correctly read out, but correctly explained; this assurance was given to me by a responsible Government inspector whose father was a parson, and he had frequently himself witnessed such tests, which are of course only of real service in the case of poor and obscure people.

Finns of all classes, without making any secret of it, seem entirely out of sympathy with the Russian Government, which, however, in spite of political changes and raids upon the old Finnish Constitution made within the past twelve years, seems to leave the Finns as much to themselves and their own laws and customs as is possible in view of the political dangers which threaten or may threaten Russia on the part of Germany and Sweden. Of course, the Finns are interested in the great war which is now going on; but this interest is chiefly an economic one, as their own trade is greatly interfered with. Trade sympathies are entirely with Germany, for there is very little commerce with Russia. Either Britain, France, or Germany would (negatively) be as welcome a master as Russia, with whose sovereignty the Finns have no great desire to quarrel; but they have never been a perfectly independent state, and seem to have lost any natural instinct to form one. What they do want is their own laws and customs, freedom of thought, and so on. They seem passionately fond of their beautiful country; and out of half-a-million Finns in America, twelve to fifteen thousand come home annually for the summer, or to stay permanently, in each case with a store of dollars saved. In Finland itself the females of the population are largely in excess of the males, and female rights are now more developed probably than in any other country. Public spirit seems to run very high, and the power of economical co-operation is clearly understood. The national demeanour tends rather to the silent, contemplative, and gloomy; but great courtesy is shown in a quiet way both to each other and to strangers, always provided no aggressive, overfamiliar, or complaining attitude calls for an exhibition of that passive stubbornness at which the Finns are such past-masters.

Practically the whole population belongs to the somewhat dreary Lutheran Church, though of course there are a few Catholics left from times when Catholicism was the only Christianity known in north Europe. There are about five thousand Orthodox Finns (apart from the Russian garrisons) in the country, but few of them understand Russian, or indeed the religion which for one reason or another they have passively inherited.

Lake Saima is about two hundred and fifty feet higher than Lake Ladoga, which is only a few feet above the level of the sea; the northern half of Ladoga is Finnish, the southern half Russian. The Finnish frontier is about forty

miles from both St Petersburg and Schlüsselburg, on the west coast; the chief island lying north in Lake Ladoga is Russian, though nearer to Finland, and on it is a celebrated monastery. The waters of the Vuotsen carry the contents of Lake Saima with great rapidity over the comparatively short distance to Lake Ladoga, and in some places—as, for instance, the well-known Imatra 'Falls'—a fierce rapid or race is developed. The rest of east Finland is an intricate, shapeless mass of lakes, rivers, and islands, the small islands, thousands in number, being nearly all uninhabited and thickly covered with birch, larch, or pine. In many features a sail through this network resembles a voyage from Stockholm to Göteborg, through the Swedish Canal, and the locks are about as numerous. Between Viborg and Willmanstrand there are seen on the banks of the Saima Canal stone monuments to Ericsson, the chief maker of the canal; Count Hartmann, whose economic assistance was very great; and the Governor-General Berg, who saw the enterprise to its end. There are also stone inscriptions to the Emperors Nicholas the First and Alexander the Second, who visited a point near Lauritsala about seventy and sixty years ago respectively. There are some fine celluloid factories in the Willmanstrand-Lauritsala tract.

All the way between St Petersburg and Viborg, by train, there are numerous *datcha* stations, Russian and Finnish, to which St Petersburg residents flock for the summer. As scarcely any average well-to-do Russian possesses a town house of his own, it is a relief, after stewing during nine or ten months of cold weather in overheated and comparatively cheerless flats, to betake himself to a wooden *datcha*, bask in the sun, and feel that he has a home of his own. At the beginning of summer about 10 per cent. of Russians seem to get toothache or neuralgia in the face owing to the sudden appetite for fresh air. The majority of these *datchas* are rather seedy, unfinished, and not too neatly kept structures; moreover, the surroundings are flat and sandy; but still there is a sense of escape from responsibility which acts as a good tonic for the coming year. Some of the smarter Russians go instead to Staraya Russa, a sort of Harrogate on the river Volkhov, south of Novgorod, where there are a high-class Casino Hotel, a well-kept park or garden, and a succession of amusements and distractions. Of course the rich ones go to Monte Carlo or some other gay place on the Riviera, to Geneva, to Paris, &c. The Finns have also their *datcha* life in summer; but they are not an extravagant and convivial race, and their holiday is more of a temperate roughing it amongst the woods.

When you are once settled in Viborg, the innumerable small steamers which infest the canals and lakes can take you comfortably all over the

country; in fact, it is quite possible with one short land-stage to go by water 'overland' to Uleaborg. We seriously thought of doing so instead of taking the Raumo-Gefle route; but finally we were satisfied with Joensuu and the numerous places between it and the Imatra Falls, which themselves furnish enough matter for a fortnight's cruise; the air is perfect, and the sudden changes of scenery a never-failing pleasure.

The Finns are more than usually obstinate and stupid in the matter of language. Even in the case of Finnish steamers running between Hull and Helsingfors the female attendance is largely inarticulate; inland amongst the lakes the girls not only cannot speak a word even of Russian, let alone French, English, or German, but they show the most provoking slowness in guessing what the guest wants; on the other hand, the slovenly and ignorant Russian servant or cabman is extremely alert mentally.

The laws of Finland are based on those introduced by Sweden six or seven centuries ago, and Russia lets law alone. Senators are of two classes, the economic and the juridical; these are the highest civilian officials under the Russian Governor-General. Husband and wife have equal rights. A man can only leave to strangers what money he has made for himself; all inherited property must go to wife and children

in equal halves; if no wife is left, then all must go to the children, and *vice versa*. The Finns and Esthonians—that is, the 'marsh' people and the 'east' people—belonged to the same *souche*, and being driven from 'Mongolia' (as it is vaguely termed by the knowing ones) by the Slavs, took different sides of Lake Ladoga when they settled on the Finland Gulf. The Lapps (apparently distant kinsmen) were driven farther north, and still bear a very Mongolian—that is, really Mongol, as now seen in China—appearance. The Finns and Esthonians can understand each other as well, say, as the Spaniards and Italians, and it is now securely established that a small percentage of Madjar or Hungarian is unmistakably connected with Finnish and Esthonian. Swedish is compulsory in all Finnish schools; even German is 'measurably' within the compulsory category in certain grades of schools; Russian much the same, with wider limits; English and French are never compulsory. Most scientific works are read in Swedish; but world-renowned works like Shakespeare, as also English and French novels, are translated into Finnish as well as Swedish. In cleanliness the Finns rank with the Dutch; but they are not so careful about vermin in their trains, boats, carriages, &c., nor are they quite perfect in the management of lavatory arrangements.

THE DRIVING FORCE.

CHAPTER II.

NOT long after, with one of those little refinements of cruelty to which Robespierre and the more intelligent of his satellites were prone, Lucien was sent down to this very district to assist the local Committee of National Safety in hunting out the very men and women who had been the friends of his youth. He quite understood the meaning of the appointment. He had been born an aristocrat, and was therefore a creature suspect in the natural order of things. The mission was to try him, to see if any humanity still remained in him.

Lucien, it almost seemed, had determined to outdo even the most merciless. His zeal was such, and his success, aided by his intimate knowledge of the country, so great, that soon, from being an instrument to execute commands, he was advanced to a position where he issued them.

It was he who received intelligence; it was he to whom spies and informers addressed their reports. If any château was burned down, he was told of it; if any aristocrat—he called them 'pestilentials' as glibly as any one else now—was known to be at large, it was he whose business it was to organise bands to hunt them down; and so, in the course of days, he came to the conclusion that there was what he called a 'leakage.'

Some one was helping the proscribed men and women to escape. It was evident that there was some organised method by which these hunted men and women were passed over the French frontier, probably by way of Lake Lemane, into Switzerland.

That conclusion set him thinking; made him double his guard at certain points. But day by day he heard nothing; no arrests were effected, no information brought in; and so many were the fugitives known to have escaped that the authorities in Paris began to hint, in terms which left no doubt about their meaning, that unless there was a change things would assuredly become unpleasant for the man in charge, who, as the reminders he received never failed to remark, must always remember that the taint of noble birth clung to him.

Lucien began to have visions of his own arrest; he thought unpleasantly often of that guillotine which was erected in practically every town in France. His mind was troubled with just such misgiving one afternoon in the late summer. There had been a more than usually audacious evasion in his district but a few days before, and every time he heard the rap of a horse's hoof on the flags before the window of

the room which served for his official bureau he could not help holding his breath for a moment until he made sure whether it were or were not a messenger from Robespierre himself with a warrant of arrest in his pocket.

But this time the noise was only the door into the street opening roughly. Lucien glanced over his shoulder; he saw that a man was coming in who filled the office of clerk to him, but who, according to the usage of the moment, was known as an 'official,' lest his feelings—and those in like case to him—might be hurt by a suggestion of honest work for honest wages.

'Thou,' he said, for both principals and subordinates had perforce to use the second personal pronoun to show that all men were equal.

'Yes,' said the clerk curtly. He was undersized, he had a sallow face, and as he had opened the door noisily, he shut it with a bang.

'Any news?' Lucien inquired.

The man perhaps heard the anxiety in his superior's voice, for he smiled evilly.

'A report from the emissary you sent to go round the lake, *citoyen*,' he returned.

Lucien stretched out his hand. 'Has he heard anything?' he asked.

'Read for yourself,' retorted the 'official' insolently, and he tossed several sheets of paper on to the table.

Lucien took them up and began to read eagerly; then he looked up. 'It is always the same thing,' he muttered angrily—'pages about nothing, and not a single word of any use.'

He fluttered the sheets in his hand. He turned to the very end. Here was a supplement headed, 'Remarks on individuals.'

Lucien began to glance at these descriptions. He was just about to put the papers down, to say that he did not want to read line after line of minute detail about quite uninteresting peasant men and women, when a single word caught his eye. He read it eagerly. He went back to the beginning of the sentence. This sentence ran: 'This man is without any particular mark of identification except that in the palm of his right hand is a deep dent which might have been caused by the bite of an animal, but more probably by the point of a knife.'

The words arrested Lucien; and well trained as he was to the repression of any outward manifestation, he had much ado to keep an exclamation from his lips, which his subordinate, apparently writing at the next table, would be sure to make a note of.

He turned back a page. The description referred to a young fisherman who hawked his catch in the villages adjacent to Lake Lemman from the shore right up to the ruins of the castle of Palud. The fellow, so the report went on, was young, vigorous, seemingly not over-intelligent, but ready on all occasions to cry, '*A bas les aristocrates!*' especially when he was promised a mug of wine for his patriotic exertions.

Lucien read that paragraph over once—twice. He recollected—could he ever forget?—the day, so long ago, when he and Henri had cut down boughs of hawthorn, the day when Marie-Félicité first came to live in the château. It was his knife that had gone deep into Henri's hand; the mark of it—just one round, deep dent—had always remained.

He stopped a moment at that recollection. He breathed hard. 'Bring the identification-book,' he said curtly, in his excitement, to his 'official.'

The man who was addressed seemed to ponder whether he would or would not obey. Then he apparently concluded to condescend so far. He brought a great book, bound—by an irony that occurred neither to him nor to Lucien—in white parchment; he pushed it roughly to his chief. 'Hast thou got something?' he inquired familiarly.

Lucien was about to answer eagerly; but he changed his mind. 'As little as usual,' he said, with no set plan as yet, but just to gain time.

He opened the sinister catalogue. Many of the pages were filled, most of them with Lucien's own neat writing. In it he entered particulars of any proscribed individual, of any man or woman suspected of lukewarmness—the colour of their hair, of their eyes; the build of them; above all, any peculiarity. He dipped his pen in the ink, turned back the leaves of the report, and then he suddenly dropped the quill.

His better self rose up within him. His heart asked himself if he could hunt down his own kith and kin. The next minute it was a very different thing which kept him still. If he entered a description of this fisherman, his subordinate might—or, rather, assuredly would—read it.

Any person mentioned in this book became at once an object of surveillance. The 'official,' whom Lucien shrewdly suspected to be a spy on him as well as his underling, might take the matter up himself. He might send information on his own account to another Committee of Public Safety. Lucien had reason to think the 'official' had done so once already when an important capture was impending. That time the *aristo* had escaped; so the 'official' had probably been snubbed for his interference. This time he might have better luck, and if the prisoner should turn out to be Henri de Palud, Lucien saw at once how awkward that would make his own position, precarious enough as it was already. As his mind ran quickly over these things, he determined how to act.

'Call the Captain of the National Guard, *citoyen*,' he said. 'And to-morrow you will be in charge here; I am called away on business.'

He had said the same thing several times before, and each time, as the 'official' heard, he received the news with the same scowling displeasure. It meant that the *ex-aristo* was on the scent of something that would bring him

into prominence, while he, a man of the people, was tied to his desk.

The underling rose with a frown; he put his thumbs into the arm-holes of his striped red-white-and-blue waistcoat, badly lacking in its first freshness. He walked, not towards the door, but up to his chief. 'Send me,' he said, as a man demanding his rights might. 'You have had your turn; I want mine.'

Lucien looked at the 'official.' He threw up his head. For a moment he forgot his rôle; he was about to put this low fellow in his place; and then he recollected. '*Citoyen*,' he said suavely, 'you are indispensable here. Have but a little more patience, and you will see what I am reserving for you. I have mentioned your zeal in the very last report I sent to Paris.'

The other man leered. He considered a moment. 'I suppose you are lying,' he said rudely. 'But take care. I am clean all through. You can't say so much for yourself.'

Lucien's eyes blazed. 'I repeat, have patience, *Citoyen* Thoud,' he returned. 'And have the goodness to call the Captain of the National Guard.'

This time the 'official' thought fit to do as he was bid. The portly Captain of the Guard came in, and Lucien had a brief interview with him. He meant to set out that night for the lake, and wanted a few men as escort.

After arranging this, Lucien was left alone. He impatiently scattered some sand over the newly written pages, swept it from the leaves of the identification-book on to the dirty floor, and rose. He looked up at a door on the other side of the room. It was not only locked, but it was barred as well.

His face darkened as he thought of what was on the other side of that door. It separated him from the men and women whom that very morning he had helped to condemn to death. The suspects were confined in the old church where so many of them had worshipped. The altar was desecrated now; it was a criminal offence to say as much as a prayer at it; the high windows of the nave had been hastily provided with iron bars; and where the glass was broken the wind blew in upon the prisoners, and sometimes the rain came spattering through; not infrequently a stone or filth was thrown by those without, who would lose no opportunity of insulting a 'pestilential.'

Yet Lucien could not but remember that these aristocrats had looked at him, without a single exception, as if they, bound, bedraggled, worn with fatigue, half-fed as they were, could afford to pity him. Each silent expression of disdain had hardened his heart; each open expression of scorn—for he did not go altogether scathless—had but made him the more vindictive; and now the question that would persist in intruding into his mind—though by his own action he had seemed to settle it a few moments before—was,

should he or should he not set the seal on his own infamy, and he himself hunt down his own kith and kin?

He was sure that the fisherman was his cousin Henri disguised; that dent in the hand seemed to him conclusive evidence. And it was probably Henri who was arranging for the fugitives to escape across the lake. Henri always had been a powerful oar, full of daring, full of resource. He knew every path across the hills, every little cove where a boat might put out on to the lake. He knew of a cave here, a hollow there, where a fugitive might lie *perdu* until he or she could be smuggled across. It was possible that some peasant man or woman so far forgot the times as still to be faithful to him who had been born the master, and helped him.

Lucien stepped back from the table. He stood in the room which in the old days had been the sacristy. The sacred emblems were defaced; the mocking words *Liberté, Égalité, Fraternité* were painted over the outer door; the vestment-cases were emptied of their robes; and the sliding shelves now held papers of arrest, summonses, requisition orders, and volumes similar to that book of identification which still lay open on the very table where so often had rested the beautiful silver vessels used to commemorate the perfection of all self-abnegation, of all love for sinners as well as saints.

Lucien thrust his hand into his pocket. He moved impatiently about the still room. His long hair dangled over his ears; his eyes looked out sombre, dark. He went to the window. Through the leaded panes upheld by ribs of delicate tracery, he could catch a glimpse of the market-place, where every day, as the evening wore on, in the midst of the flagged space, the guillotine would be erected, and before the moon was fully up men and women, sent by him to their death, would mount those steps; and as each head fell, the mob, with not one single impulse of human kindness, would yell, '*À bas les aristocrates!*' would call on him, Lucien, to provide them with yet more spectacles of the same entertaining nature.

If he were to bring them Henri Hauteville de Palud, the man who rightfully was the owner of more than half the town, what would the mob have to say to him, Lucien? There was not a man, not a woman, watching who would not know what relation the judge and the prisoner bore to each other. And if, as Henri's head rolled down into the sawdust, the escape of the fugitives over the border ended, what would the authorities at Paris not say to him, Lucien?

The man in the long, dark-blue coat, with the tricolour of office round his waist, with his eyes sunk deep into their sockets, and his mouth telling its own tale, dreamed his dream, saw his vision; for both dreams and visions can be bad as well as good. He saw himself advanced by what was called at this moment 'his zeal,' first

to be the ruling authority, not in this poor little town, but throughout the province; then transferred to Paris, competing with Robespierre, with Danton. Where those two men had ascended, why should not Lucien Palud (he was careful to drop the 'de') mount? That notion dominated him. If he had ever thought of sparing Henri, he now swept the idea from him. The capture of Henri was necessary to give an impetus to his career. Henri must die that he might be uplifted.

He swung round from the window. He went again to the book open on the table. He was about to close it, when a sudden thought struck him. He had not a doubt that he was being watched. His subordinate would know that a paper about some individual or individuals had been brought in; he could tear that report up. He stooped and took it off the floor; but if any curious eyes looked, they would find that no new entry had been made in the identification-book. He took up his pen, convinced that he must write something.

The first column was headed 'Name.' Lucien instantly wrote in the space for that, 'Unknown at present.' The next was headed 'Appearance.' That gave Lucien pause. He must not make it too unlike Henri, in case he was arrested; and yet he must not make it so like him that if he escaped it could be urged from this very book that he, Lucien, had let his relative go. He put down things in general terms. The height he might as well make correct. He knew it, for it was the same as his own. He would say that the eyes were brown; plenty of men had brown eyes besides himself and Henri. He could say a few other such unimportant things. Then he came to the column devoted to the description of a suspect's calling. That he wrote down, quickly enough, 'Supposed to be fisherman.' Finally he came to the marks of identification. Here he paused. Should he or should he not mention the very thing that had given him the clue? He decided he would not. The fewer who knew of that the better.

He finished and closed the book with a snap. He thrust it into a red velvet-lined space. He locked the door of the vestment-cupboard, and put the key in his pocket. His mouth twisted as he did that. He had reason to believe his subordinate possessed a duplicate. That man Thoud was in the way. Lucien hated his presence. He was but waiting until some slip gave him the pretext, and then would not he hurry to denounce him!

He was thinking of this, when he found that he was thirsty—very thirsty. He crossed to the little lavabo, where, century after century, the priests before the office and after the office had washed their hands. A little cup still stood on a ledge of marble at the right hand; it was attached by its slender chain; it had been there for years, and many a good man had drunk his cup of cold water out of it. Lucien filled it

greedily now. He tossed it off at one draught, and filled it again, when, with the metal rim almost touching his lips, he paused. It suddenly leaped into his mind to wonder where Marie-Felicité might be. He had heard no news of her. He put the cup down on the slab with so violent a movement that the metal rang against the stone and the water was spilled over.

The agent made no mention of a woman with the fisherman. Probably Marie-Felicité was safe in Switzerland. Lucien ground a hard word between his teeth. Though he knew better than to wash often, since to be dirty was to be patriotic in the eyes of his masters, he turned the water on. It splashed into the marble basin carved in the form of a shell. Lucien plunged his hands into it, and dashed it on to his face. There was a tumult within him. He did not know what he wanted. With one turn of his mind he gloated as he thought of Marie-Felicité imploring him to spare Henri's life, and of the deaf ear he would lend; with another, he was not sure that he was not glad to think of her as safe in Switzerland. But, whether he realised it or not, it was the thought of Marie-Felicité, who had preferred Henri to him, which had brought the blood to fever-heat in his veins, which made him gasp as he splashed among the water with hands which trembled.

All the rest of that summer day Lucien waited, filled with so violent a mixture of feeling that he could hardly distinguish one sentiment from another. Only one thing was clear. He meant to arrest Henri if he could. Sometimes he hoped Marie-Felicité might be with him; sometimes he hoped she was safe across Lake Lemman.

He was doomed, however, to disappointment. After a long march through the dark, he and the guard came to the point by the lake where the fisherman was said to land. They waited, while the moon got up, while the silver light flooded all the beautiful lake, but not a single boat drew in near the shore.

When dawn flushed the sky, Lucien cursed his luck. The fisherman was not on French soil that day. If Lucien had consulted his own inclinations he would have lingered by that shore; but certain considerations, and, above all, Thoud, drew him back to the bureau in the old sacristy.

He left a man to spy out the land, a fellow whom he thought he could trust, since he had heard him and his 'official' exchange anything but complimentary opinions of each other.

One day went by; two. Lucien began to fear that the fisherman had received a warning; and then came the news of a new evasion. At least three suspects had got safe away across the lake.

His 'official' was with Lucien when he heard this news. The man looked up at his chief with an expression there was no mistaking. 'You don't seem so fortunate as you were,' Thoud remarked. 'The rabbits get across the

water every night now. You had better let me go and see what I can do, as you always come back with your hands empty.'

Lucien put his subordinate off for the coming night. If he heard nothing before the next twenty-four hours were past, Lucien realised that to save his own skin he must let Thoud take his place, and trust that he would fail.

But before that day drew to twilight, while the hammering that went on at a fixed hour every night in the *Place* was raising the guillotine before the windows of the sacristy, the man whom Lucien had left by the shores of the lake appeared at the sacristy door and asked for the Citoyen Commissioner Palud.

Thoud introduced the new-comer, and coolly announced that he meant to be present through the interview by taking his seat and beginning to bite his nails.

But at all costs Lucien felt that he must receive this report alone. 'Summon the guard, please, *citoyen*,' he said.

Thoud looked up. 'There is time enough yet,' he retorted significantly.

But Lucien held to his point, and at last the 'official' got off his stool. As he went out, however, he fired his parting shot.

'It looks queer, queer for you, *citoyen*,' he said, jerking his head at Lucien, 'that you want to make a secret of public business. I am wondering what Citoyen Robespierre would think if he knew.'

The threat was apparent. The spy looked at Lucien, and his face showed how afraid he was.

But Lucien laughed. 'I will tell you what the Citoyen Robespierre thinks,' he said to Thoud, 'when I get the answer to the report that I shall write to-morrow.'

After that the door out to the street banged, and Lucien and the informer were left alone.

This time the informer's report was full of encouragement. The man had watched the shore of the lake in vain for a day and a night; then it occurred to him to try a little farther inland. There he heard of the fisherman, and following the trail, he discovered that the man he was searching for often passed a night at a certain little cottage perched up against the side of the hill known locally as the *Colline Valcaulx*. And this time the agent added another item of information. The fisherman was not alone now; he had with him a young lad, whose business it seemed to be to help to carry the baskets of fish.

(Continued on page 39.)

THE FIRST ARROW.

By ERNEST LYLE.

THOUSANDS of years ago—nobody knows how long—while the world was still in its infancy, a man sat at the roots of a giant tree in a glade of a mighty forest. The strong noonday sun shone down upon him, setting his body in a conspicuous light, and revealing his undeveloped form, narrow chest, and frail limbs; for as a type of the early human race he was a mean specimen. Yet, in spite of his physical weakness, there was that about his head—a gleam of intelligence in his eyes—that would have distinguished him from the other men of his tribe were they at hand for comparison. But they—the strong men, the mighty hunters—were away on the annual food-getting expedition; and he, the frail and puny one known to them as Reed the Weak, had been left behind.

Reed's position in the tribe was precarious. At his birth his mother had died, and he had grown up without even the little care that these primitive people bestowed upon their children. When he reached adult age the other young men of the tribe ignored him; while the old men denied him the right of manhood—he was not allowed to have a mate. As for the women and the children, they treated him with scorn, taking liberties with him which they would not have dared to do with a normal man of their kind. In their subconscious way they all saw in him something unlike themselves, something unfinished

and imperfect, and in their primitive unreasoning they made him an outcast.

As he sat in the blinding sunlight he was not idle. Beside him lay a bundle of rods and the tendons of animals, while at his feet were pieces of flint and shells, and a number of gaudy feathers. He was busy with these simple materials, and his hands worked with skill. In his savage brain an idea had taken root. One day, while he was pushing his way through the forest, a light branch of a tree which he had brushed aside sprang back and struck him on the face. For a few moments he stood, dazed by the unexpected blow. Then, as he recovered from the slight shock, the seed of the idea dropped into his brain: What was the force that had caused the branch to rebound and strike him? Why did it not remain in the position to which it had been moved? These questions slowly presented themselves, and his mind groped vaguely on the problem. Taking the offending branch in his hand, he pushed it back to its farthest limit and suddenly released it. The result was the same as before—it sprang back into its former position. He did this many times, his mind beginning to act in a way it had never done before.

For months he pondered over the idea. The other men were absent on their hunting expedition, and so long as he kept out of the way of the women and the children there was nothing to

disturb his thoughts; so he spent his days in the forest learning the secrets of the trees.

The result of these months of thought was his daily work in the secluded glade. The supple branch of the tree had taught him that other branches, even when torn from their parent trunk, would act in the same way. The rude spears used by his tribe had suggested an arrow; and had he not seen the birds—the mighty eagles and swift hawks—swoop down on their prey, guided by the tuft of feathers in their outspread tails?

He had chosen this secluded spot for secrecy. Some instinct warned him that he must not be discovered at his new occupation. In those early days, as at a later period, death was often the reward of those who sought out inventions.

In spite of his precautions, he did not work unobserved. Cowering in the dense underwood of the forest, a girl lay watching him, her big tawny eyes glowing with interest as she gazed at his strange toil. In striking contrast to the man, she was a magnificent specimen of the world's first children. The tattered girdle of skin that hung about her hid none of the glorious symmetry of her maiden body, while a mane of strong yellow hair flowed down her supple back. Known to her people as She of the Hair, she was the most sought after maiden of the tribe. She was now mate-old, and soon, when the hunters returned, she would be claimed, and her girlhood brought to a sudden close.

This was not her first visit to the glade. She had stumbled on the place some time before, and had ever since been a secret spectator of the man's labours. She had witnessed with awe the short flight of his first arrow, and in silence had shared his jubilation. Every day she had followed him when he stole away from the rude habitations of the tribe, and had taken up her place in the thicket, fascinated by the strangeness of his work.

These two were not the only living creatures in the neighbourhood of the glade. Crouching on the limb of a tree in the forest twilight was a monster cat, deadliest enemy of the tribe. The great beast was behind the girl, so that the three were almost in a straight line, the man facing the other two; but he was too deeply engaged in his work to notice either. Only a short distance separated the girl from the cat, as the brute lay on the branch with muscles taut, ready to spring.

The man was setting a newly made arrow to the string, when the girl, eager to see the tiny spear make its wonderful flight, leaned forward. Reed's ear caught the sound, and his quick eyes immediately found the spot from which it had come, there to encounter the girl's wondering gaze. For a moment a scowl crossed his face, but only for a moment, for at that instant he caught sight of a pair of glowing eyes, cruel and terrible, behind her.

It was then the cat made its spring, and it

was at that moment that Reed loosed the arrow on an arrow's first flight for the protection of a member of the human race. With unerring accuracy it sped forward, meeting the cat in mid-air, and penetrating the soft underpart of the animal's body. The force of the shaft, weak though it was, shortened the leap, and, instead of alighting on the girl's shoulders, the beast came down on the impaling arrow, driving the slender rod to a vital spot. Howling with surprise and agony, the animal rolled over on its back, pawing the air, and then, after a few fierce struggles, it lay still. Man's skill had triumphed.

From out of the thicket leaped the girl, and, running to the man, she threw herself at his feet, clasping him about the knees and muttering strange sounds. For a few moments Reed stood over her, conflicting emotions raging in his breast. His first impulse was to seize one of his arrows and bury it in her flesh; for had she not discovered his secret, and would she not reveal it to the tribe? Then, as he gazed down on her, he remembered that she was something different from himself, and sensations—not chivalrous—seized him. Here at his feet lay a thing he had most ardently desired, but because of his weakness it had been denied him. What chance had he of a mate—he the outcast? Soon the hunters would return and the mating season begin, but he must hold himself aloof from a contest where might was the only right. Now lying before him at his mercy was a prize which, once his, would redeem him from the insults which he daily suffered. No longer would the women drive him from their huts or the children call out derisive names at his approach. She was his; he had saved her from the great enemy which all men feared; but could he hold and keep her for himself? Unconsciously he made the resolve that he would try; and, stooping down, he touched the girl's head.

Trembling all over, she arose and stood before him, inches taller than he. Her attitude gave him self-confidence, and again unknowingly he determined that she should be his. It was the only law his instinct knew, and unquestioningly he obeyed it.

Then, in barbarous words and strange movements, he explained to her that henceforth his secret was her secret, and that she must not betray him. With mute signs the girl signified her submission. Her woman's instinct had discerned the latent genius in the man's rude composition.

The girl then pointed to the dead body of the cat, and between them they dragged it out of the thicket. Reed extracted the arrow, and hid it, with his bow and other tools, in the hollow of a tree; but it was on the strong shoulders of the girl that the dead monster was carried to the habitations of the tribe.

The story that Reed the Weak had, unaided,

killed the great beast was received with cries of derision. He was laughed at and jeered at. None believed the tale, and in the feast that was made on the animal's flesh he was not allowed to share.

The comradeship that had sprung up between the weakling and She of the Hair was, however, a more serious matter. The tribe openly disapproved of it. Whenever the two were found together a crowd of savage women would separate them, driving them apart with blows and stones.

Early one morning wild shouts of triumph told that the hunters had returned, and the people rushed out of their huts in a state of the wildest excitement. The expedition had been successful; the mighty men had brought back from the chase great stores of meat and skins. For days the tribe would give itself over to the grossest orgies of feasting, but in none of these festivities would Reed be allowed to take part. He might hang about the outskirts of the crowd and fight with the wolfish dogs for the scraps that were thrown them.

During all this time the heart of Reed was heavy. Since his wonderful discovery he felt his position more sorely than ever, for his undeveloped mind had realised that he had done something that made him superior to them all. Night and day he pondered over his invention, wondering how he could use it to win himself a place among the men of his tribe. He knew that if he were to express his claim to She of the Hair the voice of all the people would be raised against him, and his position made more galling than it already was.

For several days the feast lasted; and then, while the warriors were sleeping off the effects of their gluttony, the girls might have been seen shyly slipping away to the forest. Soon afterwards the young men would follow, and drag home their half-willing brides.

But of all the girls, only one did not retreat to the woods; She of the Hair stayed at home with the elderly women. Such a thing was unheard of in the short annals of these people, and great was the abuse and cries of shame that were levelled at her. The women sought to drive her away forcibly, but neither threats nor blows were of any avail, and they had to cast about for some explanation of her unprecedented action.

The cause was not far to seek. Now the women and the old men remembered that since the day when she and Reed had brought in the great cat these two had sought each other's company. That a girl—particularly the most sought after maiden in the tribe—could find attraction in the weak and undersized Reed was something they could not understand. There was but one solution of the problem: the weakling had by some strange means—the nature of which they could only guess at, some powerful magic the existence of which they believed in

but could not even try to understand—cast a spell upon her.

The remedy, of course, was simple: the offender must be driven forth from the tribe out into the forest, to wander about until overcome by starvation or until he fell a victim to the ferocious beasts of the woods.

The old men sat in council, and after much deliberation and lengthy speech Reed was brought before them to be given the rudiments of a trial. The light of justice was glimmering in their savage minds, and they were not wholly unfair.

Undaunted he stood before them. Even in those early days Nature was carrying on her work of compensation; and, though he was frail of body, his courage was great, and he had the gift of eloquence. He answered the charges brought against him, firmly denying that he had made use of any devil's power, and then astonished the council by demanding that She of the Hair be given him as a mate. His demand was received with the usual cries of mockery. They knew of but one way of obtaining a mate—the law of force. Still greater was their astonishment when Reed announced his intention of winning her in the manner they prescribed; and when he concluded his discourse by offering to fight the mightiest hunter of the tribe, their amazement knew no bounds.

Bor the Strong—a powerful stripling, broad of shoulder, strong of limb, tireless in the chase, dauntless in courage—was by universal consent the acknowledged champion of the tribe. It was against this warrior that the feeble Reed had set himself.

The prospect of a fight to the death—for such it must inevitably be—roused the people to the greatest enthusiasm, and a day was appointed for the contest. That Reed would fall at the other's hand was a foregone conclusion; indeed, such was the desired result, for the weakling was merely tolerated, a burden that ate of their food and gave nothing in return.

The evening before the fight Reed mysteriously disappeared. No one had seen him go away, and it was assumed that he had turned coward and hidden himself in the woods. Nevertheless the preparations for the contest were made. Two rudely shaped rings were traced on the earth, inside of which the combatants would stand. An equal supply of stones would be allotted to each. These they would hurl at each other; and then, if neither had fallen by the time these rude missiles were exhausted, they might rush out of the circles and join in closer combat.

While these arrangements were being made Reed had returned to his old haunt, the quiet glade in the forest, and had withdrawn from their hiding-place his bow and arrows. Taking the bow in hand, he practised shooting his arrows at the trunk of a tree, which, for the moment, he regarded as the mighty Bor. Until long after sunset he continued the exercise; and then,

when light had failed, he climbed a tall tree to be out of the way of beasts of prey, and there fell asleep.

A large crowd of people—in fact, the whole tribe—asssembled around the place where the contest was to take place. The fight was to commence when the sun had reached a certain point in the sky.

At the appointed hour Bor—great and terrible in his savage strength—was at his place, and a shout of admiration went up from the people; but it was followed by a murmur of disappointment when they noticed that Reed was not forthcoming.

She of the Hair, trembling with fear and excitement, stood on the outskirts of the crowd, and her heart sank when her champion did not put in an appearance. She realised that she was the cause of the trouble, and were Reed to fail her she instinctively knew that the wrath of the people would be turned upon her.

Then suddenly the shrill cry of a child—always the first of observers—was heard above the angry murmur, and Reed was seen approaching. All eyes were turned toward him, and a scoffing howl greeted his arrival. Fearlessly he took his place behind the pile of stones that had been collected for him. A shout of scornful laughter arose when they saw him take shelter behind the boulders, for they well knew that instead of hurling them at his enemy, he could scarce lift even the smallest to his shoulder.

A gray-haired old man gave the signal for the fight to begin. Bor the Strong immediately raised a big stone and hurled it at his enemy; but the missile fell short. Then he raised another and threw it with all his might. The second shot was truer, but still wide of the mark. Stone after stone followed, all of which Reed managed to dodge; but at length one struck him, and he fell to the earth. A loud cheer went up from the assembled crowd; but it ceased immediately as the little man was seen to spring to his feet, apparently hurt, but still undaunted.

The stones were now falling about him like hail, but he managed to evade them. Not a missile did he attempt to raise in defence, and the crowd, sick with disappointment, yelled out its vilest terms of abuse. All the time Reed was keeping careful watch on his enemy, preparing for the moment when Bor's supply of stones would be exhausted and the champion would rush out of his ring to attack him at close quarters.

Scarcely had the last stone left Bor's hand than Reed inserted his fingers beneath the rough skin robe that partly covered his body, and withdrew his clumsy bow and three short arrows.

A hush of surprise overcame the crowd as they asked themselves what was this strange thing the little man had brought to battle.

With steady fingers Reed fitted an arrow to the bow, and, taking careful aim, let slip the

string. The people stood spell-bound as they watched the strange proceedings, and an exclamation of admiration escaped them as for the first time they witnessed the flight of an arrow from a bow. But the shaft flew wide of its mark, and the exclamation ended in a grunt of disapproval. The second arrow sped truer, and buried itself in Bor's shoulder. With an awe-struck cry the big man stopped in his rush, wrenched the dart from his flesh, and again rushed madly at his foe.

With undiminished confidence, Reed waited until his opponent was almost upon him, and then, fixing his last arrow to the string, took a hasty but careful aim and fired. With unerring aim the shaft flew on its way, and struck Bor in the body, penetrating between the ribs. Without waiting to see the result, Reed dashed forward and hurled himself at the other's feet. Blinded with rage and stupefied by fear of Reed's strange weapons, the strong man stumbled and fell, driving the arrow to his heart. The fate that had befallen the great cat was now the fate of Bor the Strong.

A loud cry went up from the people when they saw what had overtaken their champion, and they rushed around Reed, eager to inspect and handle the wonderful new thing that for unmeasured ages was to be man's chief weapon in his struggles for supremacy over savage beasts and against his fellow-man. But Reed, caring nothing now that he had established his right to the claims of manhood, rushed through the crowd to where She of the Hair was standing alone, and, throwing an arm around her waist, hurried her away to the forest.

Another loud cry, full of victory and jubilation, went up from the people as they began to realise the importance of the great new power that had come to them—a cry that has echoed down the ages as each new invention has proclaimed the triumph of man's intelligence over savage force.

MIDWAY.

THERE is a season in each fleeting year,
Twixt summer glory and the break of spring,
When morning dawn and eastern skies appear
In robes round which the wintry shadows cling.
The beauteous flowers creep 'neath the snow-clad
ground,
And slumber there in restfulness awhile,
Till radiant spring her silvern trumpets sound,
And calls them forth once more to bloom and
smile.

When as we pass through life's fair summer land,
Oh love of mine, and gently fall on sleep,
Let us bear hence joys gathered hand in hand,
Those blissful days within our memory keep.
Like happy children homeward let us go,
Though, for a while, at midway we must part,
Content, dear one, in life and death to know
Love binds in heaven the faithful heart to
heart.

GILBERT RAE.

Chambers's Journal

SEVENTH SERIES

CONCERNING THE DARDANELLES, AND THEIR FUTURE.

ONE—and by no means the least interesting—of the results of the present 'War of the Nations' seems likely to be the disappearance from practical politics of the vexed question of the passage of the Dardanelles, perhaps the most historically important of the 'narrow waters' of ancient and modern times. From the fifth and fourth centuries before the Christian era, when Xerxes and Alexander both bridged the Hellespont (as the ancients called the Straits), up till the present year of grace—some twenty-four centuries afterwards—the Dardanelles may be said to have contributed some very stirring chapters to the history of Europe. Perhaps the final one is now developing, for on the 14th of October Sir Louis Mallet, the British Ambassador at Constantinople, announced that the Dardanelles had been closed by the German commander of the Turkish fleet because an Ottoman destroyer, with German officers on board, had been turned back by the British fleet. Our Government had previously informed the Porte that so long as its fleet was officered and manned by Germans we must regard it as part of the German fleet—which indeed it practically is, as between three and four thousand officers and men of that country's forces, wearing the German uniform, are reported to be on board it, or available to work the new Krupp guns of heavy calibre mounted in the forts and batteries that defend the Dardanelles, whilst British commerce had ceased to pass down them for many weeks past, owing to the military requisitions. The Ottoman Government, meantime, had been falling more and more under German influence, so that a rupture with the allies became almost inevitable.

Now, as the importance of the Dardanelles is derived from the military strength of the position created by nature and art combined, it will be in order to describe this, as the writer saw it some time ago; and since then these defences have been very greatly strengthened by General Liman von Sanders. Some of the old forts have been practically reconstructed, and the latest type of Krupp guns have been placed in position at the most effective positions in the Straits. The heights of Cape Hellas have been re-armed, and powerful steel protected fortifications have been constructed at Chanak and Kilid Bahr so as to command the narrowest part of the passages. An arrangement of torpedo-tubes has been set

up at the water's edge, whilst all down the Asiatic coast of the Sea of Marmora from Omali to Lapsaki strong earthworks on 'the terrace' system and containing heavy guns are now in evidence. Not only are the Straits thickly mined, but they are patrolled day and night by steam-trawlers. Powerful searchlights have also been placed at the entrances and at various commanding positions on both coasts, whilst the approaches to the Dardanelles by land have been protected by earthworks and trenches supported by detached forts, most noticeably so in the direction of the Gulf of Saros. But it is quite characteristic that the Turks—being, as always, Turks, and not perhaps having then had their German mentors at their elbow—should have left an old type of 12-inch gun at the forts guarding the entrance; hence their destruction, with the loss of ninety German and Turkish officers and soldiers, at the hands of the British men-of-war. But the control of the Straits by an unfriendly Power has greatly affected British interests in the past, and will affect them still more in the future. This is due to the great and increasing supply of wheat which is derived from Russian and Roumanian sources, the present value of which exceeds twenty-two millions sterling per annum. It is not in the interests of either Russia or Roumania, therefore, any more than of Great Britain, or, for that matter, the people of Turkey—who also export wheat—as distinct from their pro-German Government, that the control of the Dardanelles should be in the hands of a strong and unfriendly Power; but as 'possession' is said to be 'nine points of the law,' we will pass to a description of the defences, as they exist to-day, at this the 'outer gate' of maritime entrance to the Black Sea, just as the Bosphorus, one hundred and thirty miles farther east by north, is the interior one.

The effectual shutting of the Dardanelles 'gate' against a fleet in the Mediterranean belonging to the Western Powers is now an accomplished fact, because—as they are less than sixty miles in length and from one to four miles only in width, with a deep channel that approaches now close to the European and now the Asiatic shore—they are easily defended by land fortifications and batteries, reinforced by mine-fields, submarines, and torpedo craft. The fire of the fortifications and batteries prevents the removal or destruction of the mine-fields. Then there is the danger from explosives dropped by aircraft. Needless

to say, none of these perils existed on the occasions on which the British fleet succeeded in passing the forts and batteries, though even then well-placed artillery of sufficiently heavy calibre would, with gunners more efficient than the Turks, have made these attempts a failure. The fortifications proper consist of, first, the old castles of Sestos and Abydos, now known as Seddul Bahr and Kum Kaleh, standing one on either side of the entrance. These ancient edifices, however, may be almost disregarded by the super-Dreadnought, the real defences lying higher up the channel at Kilid Bahr and Chanak Kalessi, where the shores are but a mile apart.

From the entrance the European bank is the higher, rising abruptly but not precipitously from the water's edge to a height of between one hundred and fifty and two hundred feet. At Kilid Bahr there is a point, and here there is some low ground between the water and the hill behind, and on this low point are some batteries almost flush with the water. On these are about forty Krupp guns, some of them mounted on earthworks, others *en barbette*. The latter could not be worked when a fleet approached in fighting its way up the channel, as the fire from the small arms and machine-guns of the ships would sweep them. The guns in the earthworks are better protected, though even these would probably be silenced by those of the fleet; but above, on the crest of the hill, some hundreds of feet above the water, are some very powerful batteries. These constitute the greatest danger to an advancing fleet, as from their elevation the projectiles from the ships' guns would pass over them, while they would be able to play upon the enemy's decks, the most vital part in the modern battleship. Immediately behind this point the shore falls away almost at right angles, and this greatly increases the difficulty of an ascending squadron, for the force of the stream runs across the channel, and tends to take the bows of vessels across towards Chanak. This is the course that merchant steamers going up the Dardanelles usually follow, though from the entrance they have to pass along within fifty yards of the European shore, under the very muzzles of the guns of Kilid Bahr. Thence they cross the stream in a direct line for Chanak, and then sweep abruptly round again and make for the European shore at a point called Dagumen Burum, a mile and a half above Kilid Bahr, where there is another, but less formidable, fort. A fleet following this line would be met as it advanced by the fire of Kilid Bahr and Chanak. It would, too, have to pass the guns of the former within pistol-shot as it crossed Chanak, whilst it would be raked fore and aft by the guns of both forts, and would also receive the fire of Kilid Bahr on its broadside.

Chanak is not so strong naturally as Kilid Bahr; but the fortifications are much stronger,

the Krupp guns being for the most part in casemates. When it is remembered that, in addition to these very powerful forts, there would be all the obstacles that the scientific skill of the greatest military Power that the world has ever known could design for destroying an attacking fleet, the forcing of a passage at the present time would seem an impossible undertaking.

Having glanced at the position from the point of *might*, we may pass to that of *right*, incidentally remarking that a common-sense view of the matter was well voiced by Lord Lansdowne when he stated that 'it will have to be considered sooner or later to what extent a belligerent Power should control these narrow waters, which form a great avenue for the commerce of the world, and whether such a Power is justified in entirely closing them in order to facilitate hostile operations in which that Power finds itself involved.'

The point of right—that is, of international law—seems to lay down that 'it might be possible to put aside as irrelevant Article 2 of the Treaty of London (1871), Article 10 of the Treaty of Paris (1856) and its annexed convention, and Article 63 of the Treaty of Berlin (1878), under which, so long as the Porte is at peace, no foreign ships of war are to be admitted into the Straits, as these Articles have exclusive reference to 'the ancient rule of the Ottoman Empire.' But by Article 3 of the Treaty of London, 'the Black Sea and its approaches are to remain open as heretofore to the mercantile marine of all nations,' and this, evidently, both Germany and its catspaw, Turkey, have treated as a mere 'scrap of paper,' to the great detriment of commerce.

In concluding this paper it may be interesting to recall the conditions under which the British navy has succeeded, despite the great difficulty even then of the task, in *forcing* these celebrated Straits, if only to show that no such chances are likely to occur in the future; and that, therefore, when, at the end of the present great war, 'the map of Europe is rearranged,' this country must see to it that a satisfactory settlement regarding them is arranged. The first occasion was as far back as 1807, when Admiral Sir John Duckworth, in the *Royal George*, led a British squadron through the Straits, catching the Turkish garrison apparently unprepared; but on his return—Turkey being then as much under the influence of the Emperor Napoleon as she is now under that of the Emperor William—he found that he had been detained by the Emperor's representative and the Porte long enough in fruitless negotiations to ensure him a very warm reception in sailing back, his 'wooden walls' being badly holed by the enormous marble round-shot fired from brass guns. Some of these guns still remain, or did so a few years ago.

The next successful attempt was in the month of January 1878, when the British fleet of eight ironclads, formed in 'two columns of divisions,'

four ships in each, steamed up the Straits. When the vessels were approaching Fort Midjidieh, on the low projecting point of the Asiatic shore, the batteries of which fort are nearly level with the water and heavily armed with Krupp guns, Admiral Hornby's tender was sent ahead to warn the Turkish authorities of the arrival of the fleet, for it was reported that permission to pass had been first granted by the Turkish Government and then withdrawn. But the tender (the *Salamis*) soon signalled that the passage would not be disputed. So H.M.S. *Sultan* (his late Royal Highness the Duke of Edinburgh's ship) then saluted the Turkish flag; and, to the disappointment of all on board the fleet, the vessels were ordered to return to Besika Bay.

What may be called the third attempt, however, seemed at one time likely to be a far more serious affair. On the 16th of February 1878 sudden and secret orders to leave Besika Bay created intense excitement in the fleet, and on the following Tuesday orders were given that the passage was to be forced at all costs if resistance were encountered. The six British ironclads at this time composing the squadron then prepared for action, boats being hoisted aboard, davits topped, guns loaded and run out, and crews at quarters, the ships steaming up the channel in two lines at the rate of six knots an hour, the

Alexandra, *Sultan*, and *Achilles* as the starboard, the *Agincourt*, *Téméraire*, and *Swiftsure* as the port division, with the *Salamis* as tender between them. Precautions were taken to prevent firing without the admiral's orders; but as a heavy snowstorm was falling and it was blowing smartly, navigation was very difficult. At one o'clock land was seen by the starboard division, and the flagship *Alexandra* put her helm to starboard; but the *Agincourt*, not seeing the shore or the flagship's manœuvre, failed to do so immediately, which necessitated the *Alexandra's* stopping, and to avoid collision she ran ashore. The other ships, noticing this, sheered off, and made for the rendezvous at Gallipoli, with the exception of the *Sultan*, which remained to assist the *Agincourt*, which was got off about 5 p.m., little the worse for the accident. The *Raleigh* had also run ashore the day previously at a point where she had gone to succour some Turkish fugitives, and had in consequence to be sent to Malta for repairs.

From these experiences of a British fleet, when battleships were only half or less than half their present size, some idea can be formed of the difficulties in the way of navigation which modern battleships would have to contend against now, even were the Dardanelles placed in the same position internationally as the Suez Canal.

THE BRIGHT EYES OF DANGER.

CHAPTER IV.—TO THE CITY OF UNREST.

WALTER IRVING'S voice snapped the thread of my thoughts. 'See!' he said, and pointed towards our left. A wisp of smoke hung over the lip of a valley two or three miles off. 'I'll take my oath there's a camp of some sort over there. Listen!'

He leaned forward, his eyes very bright. A faint sound, droning, swelling, dying, rising again, reached us now and then on a fickle wind, and once, twice, the thin clear notes of a cavalry trumpet. Irving sat stock-still, listening eagerly, man and horse as motionless as a statue. Plainly, for all his resolve to take no side in the affairs ripening around us, alarms and excursions stirred him like wine. He drew a long breath, and the colour ebbed and flowed in his face.

'The pipes!' said he, and his voice had a new note in it. 'Faith, the Young Pretender's men are making no concealment.'

As he spoke I saw in the distance a body of horse appear as suddenly as if by magic, wheel swiftly, then whisk over the rising ground and dip out of sight into the valley.

It was clear, so far as we could judge, that the Jacobites were in camp outside Edinburgh. It surprised us to see no reconnoitring parties from the city, nor did we meet with a solitary picket. The road before us was as empty as my hand.

There we stood, in two minds whether to wait or push on, when a sudden and strong gust of wind again lifted the sound of the pipes to us; but this time shrill and manifestly nearer us.

Walter looked quickly round at me.

'We'll press on. I'm in no mind to get a bullet-hole in my waistcoat, or at best to be trailed off to kick my heels a prisoner in the Pretender's lines; and your looks belie ye if ye differ from me.'

'So far from differing from you, I'll set the example,' I replied, and sent my horse forward.

The way lay down a gentle slope, girt by fir-trees standing like anchored ships in a green sea of bracken on either side of us.

We had covered barely half a mile, when, taking a sharp angle in the road, our horses reared so suddenly that we were both in danger of being thrown. The cause—an apparition as unexpected as though from the Pit itself—turned out to be a man standing in the middle of the road. He was so wild a figure that it would have been little wonder had our horses bolted altogether. As it was, riding loosely, the marvel was that we were not unseated. I am sure that such was his intention, for he threw up his hands with an uncouth guttural shout. We steadied our mounts, the man glowering at us, with broadsword up-

lifted. He wore kilt and plaid, and little else that I could see, except a shock of hair on his head and face. I was so incensed at the fool, as I thought him, that I was on the point of spurring my horse at him, when, from the bracken on either side of the road behind him, a score of men sprang up, all armed to the teeth. They streamed swiftly out, and for a horrid moment I looked down a musket-barrel.

'An ambush!' I shouted to Walter, and turned my horse. Behind us stretched another line of armed men, with an officer mounted, pistol in hand! We were trapped. Walter Irving, I am bound to say, took it all very coolly. 'They're twenty to one,' was all that he said. Half-a-dozen of the ambuscade surrounded us, and the muskets were lowered. The men were all in the kilt, a few with muskets, but most of them equipped with targe and claymore, tall and wiry, but uncouth and savage-looking to a degree. I should not have cared to be thrown on their mercy. Indeed, most of them looked more like cut-purses than soldiers. Walter, a model of composure, walked his horse up to the line of men behind us.

'Who is in command?' I heard him ask. A mounted officer, wearing the White Cockade, rode forward, and the two men came face to face, their eyes measuring each other.

The Jacobite was sparing of speech, but civil. The Prince Regent (so he designed him), whom he served, had issued an order for the detention of disaffected or suspected persons. He did not say that we were either of these, but it was his duty to satisfy himself. Walter dismounted, and I followed his example.

'I can answer for myself and my friend,' quoth he to the officer, a smile in his eye, 'if you give me your private ear. We are on our personal ends on the road for Edinburgh, and neither for Stuart nor Hanover. I doubt your warrant to seize even suspected persons without evidence, even by the rules of war; but 'tis neither here nor there. Do you but step aside with me for a moment, and I will give you a sight of my credentials.' There was a change in his voice, even in the manner of his speech. The tone was, to my mind, one of easy confidence, and I looked admiringly on at his exercise of management of affairs and the poise of his handsome head.

The officer hesitated for a moment, running an alert and masterful eye over his prisoner.

'I am unarmed,' continued Irving. 'I carry not even a small sword, as you see; but it is not unfair to you for me to allow myself to be searched.'

There was, I thought, even a hint of impatience in his attitude.

The officer bowed. 'Come with me,' he said. 'Your friend may wait.'

He dismounted, gave his horse's bridle-rein to a soldier, and Irving and he withdrew to a clump of fir-trees a little way off.

I could see their heads close together. They were soon talking earnestly, Irving's voice pitched low, the other man's tricorne hat nodding now and then slowly as he listened. Two men were told off to guard me, the rest sitting down by the roadside, gabbling in undertones in the Gaelic. The officer and my companion were away for about ten minutes. When they returned the Jacobite came straight up to me.

'Mr Irving has made it clear that I should be exceeding my duty were I to detain either of you,' said he, speaking good English, but with a slight Highland accent. 'His Highness the Prince Regent is punctilious in such matters. I have the honour'—he raised his hand in a salute—'to wish you a safe journey, and to offer you my regrets for the delay.'

We both bowed, mounted our horses, and rode slowly off; and when I looked back, a moment afterwards, the Jacobite patrol had formed up and was marching briskly away in the other direction.

'A Highland gentleman that,' said Walter when they were out of earshot.

'He took a long time to convince,' I answered.

'He did; but he never even speired for your credentials. I showed him my introduction to my kinsman in Edinburgh, and convinced him that we were honest travellers, and no fighting men either for King or Chevalier. Man, I got the right side of him!'

'Judging from his eye, 'tis much better than the wrong side. Who is he?'

'Alasdair Stuart, his rank a captain. He gave me his name as if it had been a king's. We exchanged courtesies. Oh, the pink of politeness he is! As I thought, the Jacobites are encamped over yonder. I could get but little out of him, though, concerning the Chevalier's prospects.'

We pushed on at a brisk trot, for the day was beginning to fade. Lights appeared one by one in the distance as we drew near Edinburgh, until the great cliffs of houses that rose sheer and dark against an indigo sky were studded with points of flame. No one said yea or nay to us until we came near the Water Gate and dismounted. There an officer of the guard challenged us when we had come to about forty yards from the Gate. We made reply that we were peaceable travellers; whereupon they ordered us to draw up closer. This we did, and no doubt those inside took stock of us, for there was a great amount of caution shown, ludicrous it seemed to me, when I considered that the objects of their suspicion were two tired horsemen, and they the armed guardians of a city. But the truth is that the defence was a mere shell without heart, as I was to see later for myself.

Presently a voice hailed us in a tongue that I did not understand.

'If that be Gaelic, neither of us kens it,' called out Irving. 'It is a ruse,' he whispered to me, 'to find an excuse to keep us out. Faugh! Their hearts maun be in their boots.' Then again aloud, 'We are plain travellers, and are here on business of our own.'

It would be tedious to tell of the parleyings, the questions and answers, that followed. We were kept outside there for half-an-hour (so great was the defenders' caution), and in the end admitted singly. I was first, and showed my letter of introduction addressed to Mr Scott, the lawyer. It was fortunate that I had this to show, for it appeared that he was a well-known Whig, and a respected citizen. They passed me, after a few minutes' talk among themselves. I told them, as I had been charged by my companion, that I knew nothing concerning him beyond his name, and that he was a chance acquaintance, picked up on my ride from Westmorland. I was taken some fifty yards away when Irving was admitted and questioned. I had little fear of him once

he got into conversation with them, and, as I anticipated, he soon joined me; and a caddie (as they call them), a garrulous fellow smelling grievously of stale spirits, led the way for us to a close in the Canongate, where stood the White Horse Inn. There we got rooms; and, after supper, tired out, I slept soundly until late next morning, when I was awakened by the din of many voices and multitudinous feet on the causeway.

Edinburgh was a hive of excitement; crowds were passing, talking and gesticulating in a flutter of interest and anxiety; sleek burgesses clustered at the street corners; armed volunteers were assembling, and some squadrons of horse from their quarters in Leith went past at a hand-gallop, their sabres jingling. I learned afterwards they were some of Hamilton's dragoons.

The sudden sound of the kirks' bells broke strangely over the city of unrest, for this was a Sunday morning, the fifteenth of September.

(Continued on page 52.)

IN HONOUR OF THE FLAG.

By JOHN D. LECKIE.

THE recent intervention of the United States forces in Mexico was ostensibly due to an insult to the American flag; though President Huerta declared that such an insult could not have taken place, as no flag was hoisted on the boat which carried the American marines whose arrest brought matters to a head.

The Americans as a people are peculiarly susceptible to any insult, real or supposed, to the national emblem. The loyal British subject instantly resents any slight which may be shown to his reigning sovereign, whom he does not regard in a personal light, but as the head and representative of the nation; and any slight to the King is looked on as an insult to the entire British nation. You may tell the loyal Britisher that the Premier is an old woman or that the Lord Chancellor is a fool, and he will show no sign of being offended, though he may not concur in the opinion. But use language half as disrespectful in speaking of his sovereign and his every hair bristles with indignation; he feels that he himself, as a member of the nation, has been insulted.

The American, who has no hereditary ruler, looks on his flag in much the same light as the Britisher looks on his monarch—as the emblem and representative of the nation. The national song 'The Star-Spangled Banner' is a rival to 'Yankee Doodle.' No better evidence of this fact can be adduced than some of the events of the great Civil War which for four years devastated the country. A few episodes of that great historical drama are here recalled.

Shortly after the outbreak of the war, a

Southern sympathiser hoisted a Confederate flag over his house, which was in such close proximity to Washington that the offending emblem could be plainly discerned from the windows of the White House. The owner of the flag had publicly declared that he would shoot any man, no matter who he was, who dared to haul it down. A Federal officer, with a squad of soldiers, was detailed for the purpose of removing it. The Southern ensign was lowered, and the man who hauled it down, on passing the owner of the house with the colours in his hand, was instantly shot dead. The owner of the flag had kept his word, but was cut down the next minute by one of the squad. Terrible indeed must have been the infatuation of a man who, in the face of certain death, could dare to act as he did. The Southern papers extolled him as a hero 'who died a death which emperors might envy, and whose fame will go down to endless generations.' The incident is graphically described by Sir William Russell, who was special correspondent of the *Times* during the great Civil War.

Very noteworthy was the sudden revulsion of feeling against the American flag which prevailed in the South. At Nashville (Tennessee) a ball was held shortly after the secession of the state, and the ballroom was carpeted with a huge American flag, over which the dancers held their revels, being thus able to say that they had literally trampled under their feet that emblem which but a few days ago they had regarded as sacred.

The flag of the seceding states was suggested

by the design of 'the old concern,' as the United States Government was now called in the South. There were eleven stars, to represent the eleven states of the Southern Confederacy. These were arranged in a circle, instead of a scattered galaxy, as in the old flag. The 'fly' part, instead of numerous stripes, showed three horizontal bars. A Southern paper, in alluding to the new design, gave vent to its feelings thus: 'We object to the use of the word "stripes" as descriptive of the horizontal bars of the Confederate flag. "Stripes" is quite correct when applied to the Yankee ensign or a barber's pole; but "bars" is the proper word to use when reference is made to the glorious emblem of the Confederacy.' And so it came to be 'Stars-and-Stripes' *versus* 'Stars-and-Bars.'

The Confederate flag was as great an improvement on the old United States emblem as 'Dixie' (the national anthem of the South) was on 'Yankee Doodle.' It would have been a stroke of diplomacy if the United States Government, on the downfall of the Confederacy, had adopted the Southern flag instead of the old one, and 'Dixie' as the national anthem instead of 'Yankee Doodle.' As conquerors of the Confederacy they were quite entitled to do this, while the action would have placated the South and done much to remove that bitterness of feeling, which is not yet entirely effaced, between the two great sections of the country.

The Confederate flag waved victoriously on many a tented field; and when at last General Lee, struggling in vain against overwhelming numbers, surrendered at Appomattox, he could look back on a long series of successes gained over an enemy much his superior in numbers and resources.

The Americans, who affectionately allude to their flag as 'Old Glory,' refer contemptuously to the British ensign as 'the Blood and Entrails.' The British retaliate by calling the Stars-and-Stripes 'the Gridiron.' But these are gibes which are not used by serious-minded men, and each nation may be said to show a becoming respect for the emblem of the other.

The act of tearing down the British flag by a foreign official in time of peace is a serious matter, and one which, without instant reparation, would probably lead to war. Such an act was performed by the Portuguese Major Serpa Pinto in 1890. Pinto was a famous explorer, and one of the first to cross Africa from ocean to ocean. Finding the British flag hoisted in territory in Central Africa which he considered to belong to his own country, he hauled it down and hoisted the Portuguese flag instead. Only an immediate disavowal of the act on the part of Portugal averted war. But Pinto was not punished for his action; rather was he looked on as a hero; and a local paper eulogised the explorer as 'the man who routed the Makalolos, and, standing in the path of British usurpation,

tore down her sanguinary flag, hoisting in its stead the white-and-blue of Portugal.' Pinto was lionised and fêted on every hand. The following is an illustration of his ephemeral popularity. A Lisbon shopkeeper had in stock a large supply of hats of an antiquated pattern which he could not get rid of at any price. But a happy idea struck him. He put the unsaleable stock in the window, and labelled it 'Latest Style. The Serpa Pinto Hat.' In a very short time he cleared the lot. The white-and-blue flag of Portugal no longer exists. At the revolution which drove out the monarchy and established a republic it was abolished, and a different design substituted; as happened in France during the great Revolution of 1789, when the old flag of lilies on a field of blue gave way to the tricolour.

Nine years later an incident similar to Pinto's act occurred, also in the interior of Africa, the 'Fashoda affair,' which many will still remember. The French had hoisted their national ensign on territory which the British claimed as within their sphere of influence. The outlook was serious, for in the meantime Lord Kitchener had arrived on the scene and hoisted the British flag in opposition to that of the French, and the matter could only be settled by the backing-out of one or other of the two parties. Ultimately the French withdrew their troops, and war was averted.

To go still farther back in history, reference may be made to the *Trent* affair, now almost forgotten, which at one time threatened to plunge Great Britain into war with the United States. This happened in 1861, during the Civil War in America. A United States man-of-war stopped a British passenger-steamer while on her way from Havana to St Thomas (West Indies), and took off by force two Confederate commissioners who were on their way to Europe. They were taken to Boston and imprisoned in Fort Warren. Intense excitement prevailed in Great Britain when news arrived of this outrage on the flag. Instant preparations were made for war, which seemed at one time inevitable, and would certainly have taken place had not the American Government, at the last moment, decided to release the prisoners. This kidnapping action was upheld by the United States Government on the ground that they were only following the precedent set by Great Britain, which at one time claimed the right of stopping and searching American shipping on the high seas, and even of taking off by force any deserters found on board. This was one of the causes which led to the war of 1812-14 between the two countries. The American Government argued that if the British had the right to search foreign vessels and to take off deserters, they had an equal right to search foreign vessels and to take off by force any rebels found on board. This right had never been officially renounced

by the British Government, not even after the peace of 1814, though the matter had been tacitly dropped, and they had not afterwards sought to enforce the principle. But Lord Palmerston, who was then in office, was firm, with the result above stated.

Still less known and less justifiable is the case of the Peruvian ironclad *Huascar*, which in 1877 caused great excitement. The *Huascar* was a powerful ironclad, at that time in revolt against the Peruvian Government. As she was unable to obtain coal in any seaport, she took to stopping British vessels on the high seas and taking coal from them by force. The Peruvian Government naturally denied all responsibility for her action, and would have been only too glad to see her punished. Two British men-of-war were sent in pursuit of her, but their action proved futile. Not long afterwards she surrendered to the legal Government of Peru. Her subsequent career is worth recording. Shortly afterwards war broke out between Chili and Peru, in October 1879. Off Angamos Point she engaged in battle two Chilian ironclads, of newer construction and better armour than hers. She was defeated and captured after a desperate fight, in which nearly all her officers were killed. After the action her deck resembled a shambles. Several of the officers in command were killed in rapid succession. Among these was the heroic Admiral Grau, who was literally blown to pieces by a shell. The only part of his body that could be identified was a foot, recognisable by the boot which still contained it. This was taken to Lima and interred with gorgeous military honours.

Some of the incidents which occur during South American revolutions might seem ludicrous enough had they not also their tragic side. The present writer arrived in Rio de Janeiro shortly after the revolt of the fleet under Admiral de Mello, and saw the ruined forts and the destruction caused by his guns. He would have bombarded the South American Paris had it not been for the intervention of the foreign warships then in the harbour. Nearly twenty years later there was another revolt of the fleet in Rio harbour. The sailors mutinied, killed some of their officers, and took possession of the best part of the fleet. The ringleader was a negro named João Candido. Again the city was threatened with bombardment; but on this occasion the foreign warships

took no action to prevent it, for the flagship of the negro admiral, the *Minas Geraes*, was reckoned at that time the most powerful ship of war afloat, and could have blown any one of them out of the water; while another of his Dreadnoughts, the *São Paulo*, was almost as formidable. The rebel admiral held a review of his squadron, which formed in line and saluted his flag. Now and then, to show his power, he would fire a shot or two from his heavy guns at the forts on shore, which, however, did not reply. He sent a wireless message to the president, dictating his terms, which included increase of pay to the crew, better fare, and abolition of the 'cat' as a mode of punishment. No immediate reply was given to the audacious message; but later a private emissary was sent, who treated with the mutineers and practically conceded their demands. This shameful submission was followed by the wholesale resignation of officers of the Brazilian navy, who felt that the honour of the flag had not been upheld.

During the disastrous war which the little republic of Paraguay waged for five years against the combined forces of Brazil, Argentina, and Uruguay, many heroic feats were performed in honour of the flag. On one occasion a sergeant entrusted with the colours remained at his post though his comrades all around him were shot down. Finally he also was wounded and captured. When asked by his captors why he had not surrendered before, as he had no possible chance of escape, he calmly replied, 'I had no orders to surrender.' With him, obedience to orders and not self-preservation seemed to be the first law of nature.

Not less heroic were the feats performed for the honour of the flag during the war between Japan and Russia. On one occasion the man who bore aloft the emblem of the Rising Sun was shot down, but his place was promptly taken by another. He also soon fell, and was succeeded by a comrade. After several standard-bearers had fallen in a very brief space of time, the Russian officer in command of the firing-party was touched at the sight of so much devotion; for the Japanese, instead of being daunted at the sight, seemed to delight in thus rushing to certain death, deeming it an honour to uphold the flag. 'Don't shoot down the man with the flag,' he shouted; 'it will be planted, anyway.' And planted it was.

THE DRIVING FORCE.

CHAPTER III.

LUCIEN, when he heard this, raised his head. For a moment he forgot where he was. His mind travelled backwards, and he saw Marie-Félicité as she had been in the old days. She was not far from him now; he might see her

soon. His eyes glittered. Love is so near to hate that for the moment he longed to make her prisoner too; to make her feel that he was her master.

The wave of personal feeling died down in a

moment, and gave way to merely business-like conclusions. If anything was required to make Lucien still more certain that the fisherman and his cousin Henri were one, this choice of a refuge on the Colline Valcaulx supplied it. Lucien knew the little hovel. It was perched against the side of a steep hill; it was made of rubble, it had a door and a window, and it stood quite alone half-way up the height. But he knew more. He knew that the tumble-down dwelling was but a mask to a smuggler's retreat, and that behind it, cleverly concealed, opened back into the hill a series of caves, where in the old days contraband had been stored.

He made all the necessary arrangements then and there. He would raid the hut on the Colline Valcaulx. He would make his plans definitely as he went along; but his present idea was to surround the hut—to starve out any one who might be in it.

He was on his way by midnight. His mind whirled as he marched along. He was on the point of stopping the worst 'leakage' in all France. When he returned successful, maybe with a band of captives behind him, what could he not demand as his reward?

The word 'reward' made him tingle. If he did well, if he brought a whole catch of fish into his net, surely he might demand one of them for himself? In other words, if Marie-Félicité were among the prisoners, aristocrat as he was, might he not claim her for his reward?

The sun rose. Lucien hurried over the green fields, past the vines planted against the sunniest slopes of the hills, which cut right up into the blue sky, and as he went he perceived one fatal objection to his first plan. It was possible that when Henri knew he was surrounded, when he knew that his way to the lake was cut off, he and Marie-Félicité might elect to die together then and there. Lucien knew that more than one man had killed the woman they loved rather than let her face the horrors of imprisonment and trial. That would spoil his triumph. He wanted Marie-Félicité for himself, and he wanted also to show every man and every woman in that town that he had not hesitated to bring his own cousin back to execution.

Before him the grass was spangled with dew, over the heights still lingered the tender mist of the sunrise, and above his head rose a bird trilling for very gladness that it lived. But Lucien saw none of these things. He quickly made a new plan. His band were to lie in waiting, behind some bushes at the foot of the rise. They were to be on the lookout, and at the first sound of a pistol-shot they were to rush upon the cottage. As for himself, he meant to take Henri by surprise, to arrest him single-handed. He began to walk quickly forward. His informer had watched the hut for days. The night before, the fisherman had been seen to go in alone. On other occasions he always

left the hut about an hour after sunrise. Lucien concluded that Henri's work was suspended with the break of day.

He mounted the rise a little to the back of the cottage. He went up what was evidently a dried-up watercourse. The ascent was steep; his late occupations had hardly kept him in exercise, but he went on. He had no time to rest, until, when he was above the roof of the cottage on the slope, hidden from view, he pulled up. Something that he had forgotten for years came into his mind. Ages ago, had not he and Henri discovered another opening to the caves somewhere near where he stood? He kept very still, endeavouring to force his mind backward. At first the memory was so dim that it was but a vague impression. Then he began to piece his recollections together. He and Henri had found an opening into the caves, or they thought they had.

He began to search among the stones and the bushes. He scrambled very carefully from point to point. It was essential that he should not be seen; neither must he loosen a stone which, rolling down, might betray his presence. It took him a long time. He was almost giving it up, almost about to conclude that he had mistaken the locality, when, by chance, he slipped, and to save himself caught hold of a large rock. It moved as he hung on to it. There was a moment when he feared that he should go rolling down the steep incline, and that the boulder would crush him. Then he steadied himself. The stone had moved; it showed the beginning of an opening. An evil smile drew back his lips. He had found the smugglers' passage into the cave. He could take Henri in the rear. Before the night was out he would be even with him, though Marie-Félicité had preferred Henri to himself. As soon as the opening was large enough he lowered himself into it. For about a man's height it was no more than a narrow neck; then it widened into an incline, where, though a man could not stand upright, he could scramble along. Lucien trod cautiously. He noticed that the path was worn into a smooth, shining surface in places. It was evident that it had been much used recently. He stopped as he thought of that. What if he, a man alone, came on a whole band of fugitives? He took out his pistol, and held it ready. It was too late to retreat. If he tried to get back and summon his guard his prey might escape him. The fisherman would never come back, and the authorities might say that he, Lucien, had given a warning and let the man go.

There was a final drop to the level on which the hut was built. He let himself down. He stood listening. There was not a sound, not a whisper. He slid on to the earthen floor; he waited in the dimness. Cautiously he stretched out his left hand; in his right was the pistol,

his finger on the trigger. He had expected to be at the entrance to the cottage, but instead he found that he had some way to go along the level. He crept along. He perceived that a very faint trickle of daylight came round a mass of rock which at first had seemed to bar the way. He went towards it; he saw that a few yards before it there was a second barrier, and as he pulled himself up to it and peeped to the side, he saw that at last he had come to the cottage itself.

He looked into the one poor room. It was seemingly deserted. There were two chairs and a table in it, and some fishing-tackle in one corner; and there was that which assuredly had no connection with fish or fishing—a close-cropped wig on the table. Lucien's eyes glinted when he saw it; then he stepped hurriedly back into the shadows, for he heard some one trying the handle of the door.

He waited. It was little more than an instant in time; it was far longer, counted by all the mental stress Lucien put into it. Then he heard the grate of the latch, the creak of the door; a wedge of brighter light shot slantwise into the room, a breath of the fresh morning air; a figure appeared, entered, and shut the door. Lucien saw who it was, and saw with not a touch of compunction, but with a triumphant leap of his pulses. He clenched his fist. Henri de Palud was before him, his own cousin Henri, the man who had been as a brother to him—Marie-Félicité's husband. If he could not have love, he could at least have revenge.

Henri set down his basket, and the wig instantly caught his eye. He took it into his hand, and looked apprehensively around him. He came with a quick step straight on toward the opening.

This was Lucien's opportunity. Things were going even better than he had hoped for. He had the advantage of being in the shadow, Henri the disadvantage of the light. He let his cousin come still nearer; he examined him narrowly. There was no mistaking Henri de Palud. Even disguised, he was finer than the average man, stronger in the limbs, and more graceful in his bearing. Lucien told himself that indeed the mob, who liked their victims to be everything that victims traditionally should be, would be pleased with so fine a man when they saw him mount the scaffold.

There was yet a moment more to wait. Henri, still with that close-cropped wig in his hand, with his blue jersey across his chest, with his seaman's trousers, walked on another step. Lucien never took his eyes off him. He had still time to change his purpose; but no thought of that ever came into his mind.

Henri was all but at the turning round the rock. One footfall more, and Lucien would have taken the first step of his scheme of revenge. There was not a sound; even Henri's

footsteps made no noise as they padded into the sand on the floor of the hut.

The light grew within the bare little room. The sunshine began to come through the slits of the unglazed window, which up till then had been in shadow from the hill. A wedge of brightness struck on a tin utensil hanging from a nail against the wall; on the hearth, amid the ashes from the wood-fire, were still one or two live embers.

'Halt!' cried Lucien.

The fisherman started. His face showed his dismay; he looked anxiously at the shadows. He dropped the wig. He put his hand into his jersey; in an instant more he would have his pistol out.

But Lucien anticipated him. 'Henri Palud,' he cried, 'it is no good your shooting! I am in the shadow; you are in the light. I am armed as well as you. Besides, at the first shot my guard have orders to surround the hut. I have ten men with me; they are behind the bushes at the foot of the slope, waiting for precisely that signal.'

Henri de Palud heard. There was a little space—a very little space—while he seemed to deliberate. He stepped back, pace by pace, until he stood in the centre of the room, with the rough little table before him; and then he leaned his hands on that table and looked over it, and at last he spoke.

'Lucien,' he returned, 'even if I did not know your voice I should still be sure that it was you. You only would know of these caves; you only would know the way up by the water-course; all along it was you, and you only, I feared. You have tracked me.' There was the faintest touch of hesitation before the pronoun. 'You have come to gloat over me yourself—you, who must be without heart, without feeling. Come out; show yourself. As you say, it would be useless for me to shoot. You are quite safe. Come out; show yourself.'

There was a pause. There was stillness again, but the sun was growing higher each moment, and more and more light came through the window. A long, bright ray slanted to the ground just behind Henri de Palud. It showed him up—his calm, set face, his fearless eyes.

Henri waited one moment—two. He leaned yet farther over the table. He began to speak again. There was a driving quality in his voice. It sounded like urgency, but perhaps it was scorn. 'Lucien de Palud, my cousin, the boy whom my father loved as his own son, you hesitate to show yourself,' he went on. 'You cannot fear for your life, though traitors are always cowards. You hesitate. Why?'

The taunting speech served its purpose. With a great oath, Lucien stepped into the light. He, with his pistol in his hand, walked almost up to the table; Henri leaned over the other side.

The cousins faced each other. Lucien's brow was darkened, his eyes were dull, and his lips were thrust out. Henri was almost gay, his air was easy, and his lips had a smile on them.

'If you are not in a hurry to be going'—he began, and then he suddenly stopped the speech that was so debonair, stopped it with its latter half unsaid. He looked, instead, past Lucien, past that unbrushed blue-cloth shoulder, towards the opening, and as his eyes travelled along there suddenly came fear into his face. A patch of gray came out through the tan and the sun-burn on his cheeks, and his lips pinched in.

Lucien saw the sudden change. 'Oh!' he cried out; 'then, after all, you are not so anxious to die as you wished to make out. The guillotine isn't over-pleasant, I can tell you. It will require a good slice to take your head off your shoulders.'

Henri did not seem to hear. His eyes were fixed before him, fixed in urgent, though mute, supplication. He kept them so; and then, with his lips tight, he laughed uncertainly.

'*C'est vrai*,' he admitted to the man who was watching him. 'I do not want to die.' He broke off. He looked hard at Lucien. 'We were boys together,' he mumbled. 'Give me a little respite.'

Lucien, in his eagerness, came a step nearer. Henri was begging for a few minutes' grace from him. The man Marie-Félicité preferred was asking, and asking humbly, for a few seconds more of life from the man she had rejected. 'No!' he flung out. 'No! there shall be no delay. Quick! turn about! march out, or'—

Henri had given a last look past Lucien. His face had cleared. He was turning his powerful frame about, was going, it seemed, as meek as a bleating lamb to the slaughter.

Lucien laughed sardonically. He began to move towards the door. He meant to make sure of Henri, and then to lie in wait for Marie-Félicité. He calculated that she would come to look for her husband even if she were safe over the lake.

The two went on, one cousin before the other—one with a cruel death ahead of him, the other with the guilt of that death on his shoulders; and then both men suddenly swung round.

A voice, a woman's voice, was crying out, and it was crying not Henri's name but Lucien's.

The cousins both looked back into the little room. Lucien looked towards the opening into the cave, but no one was there; Henri looked towards it, and when he had glanced that way but once, he cried out to Heaven.

'*Ciel!*' he cried, 'did I not go willingly? Did I not hasten my own going that she might be spared?'

Lucien heard. He put his hands to his sides and laughed aloud. So that was why Henri had played the coward. He wanted Lucien to hurry him off. But did Henri think that he, Lucien, would not come back to find who else might be in the hut?

He was about to say that, but he restrained himself for the moment. Then what both men looked for happened; she came into the light—Marie-Félicité herself. It was she unmistakably—though her feet were in poor fisher-lad's shoes; though a fisher-boy's garments replaced her sweeping brocades; though her face was burnt brown, and her slender hands were worn with hard work. Her hair was unbound now, and it fell in a rippling wave down over her shoulders; and as Lucien looked, it somehow came to him that it was a pity to hide such beautiful hair under the wig he had seen in Henri's hand.

Marie-Félicité looked up once at her husband. There is a man now and again who receives such a look from a woman; it is generally when she pledges herself to him; and if he be a man at all, it remains in his mind as long as they both live.

It was such a glance that Marie-Félicité bestowed on Henri. Lucien saw it, and bit his lip. Even now they had the better of him, those two. They belonged to each other, and what was revenge against possession?

He tried to spur himself, to tell himself that indeed he was the master; he tried to anticipate Marie-Félicité's supplications. She might perhaps kneel to him, and he would spurn her. He looked down at the toe of his boot. He told himself he would push her aside with that.

But do what he would, he could not recapture his old exultation. His prisoners stood awaiting his pleasure. But they stood side by side, and now Henri put out his hand, and Marie-Félicité placed hers in it. Lucien might end their lives, but he could not end their love, and he knew it. Something seemed to mock at him, to tell him that his revenge had failed, and failed miserably. He flung up his head.

'*Nom de nom*'—he swore below his breath, still striving to goad his own passions—'*Nom de nom*, what has come to me?'

He thrust his hands into his pockets; the long lock of hair he wore down by his ear strayed across his cheek; he planted his feet wide apart.

'You are my prisoners'—he was beginning.

But Marie-Félicité let go Henri's hand; she came round the table. She walked toward Lucien—up to him; she stood very near to him.

(Continued on page 55.)

THE DOMESTIC FUEL OF THE FUTURE.

By F. SWANN.

RAW coal is by no means an ideal fuel for household use. Indeed, Sir Oliver Lodge has told us that to heap coals in the fireplace, and then set fire to them, is a barbarous method of obtaining heat. Whether barbarous or not, it is certainly a wasteful process.

Experiment has shown that from 4 to 5 per cent. of ordinary bituminous house-coal passes unburnt up the chimney in the shape of steam, smoke, soot, tar, ammonia, and vaporised oils, all of which have a commercial value far too great to be thus poured indiscriminately into the atmosphere. Nor does the loss end here. A large percentage of the available heat-energy of the coal is expended in preparing the coal for combustion, as may readily be perceived by watching what takes place when a fire is 'mended.'

'Mending' a fire usually means spoiling it by covering the incandescent cinders with a mass of coal, thus lowering the temperature of the whole bulk. Not until the smoke, soot, &c. have been driven off does the fresh fuel begin in its own turn to glow and throw out radiant heat. Nevertheless, for all the heat-energy wasted in performing the preliminary distilling operations, as well as for the distillates projected into the atmosphere, the consumer has had to pay in hard cash.

The question, therefore, presents itself whether domestic fuel could not undergo some preparatory treatment before it comes into the hands of the householder, leaving a material which would ignite promptly, and spend its whole substance in shedding radiant heat, instead of frittering away a large portion of its available heat-energy in distilling itself into a suitable form for combustion. In other words, could not our household fuel be half-coked previous to delivery into our coal-cellars? Gasworks coke does not satisfy the necessary requirements. Having been carbonised at an intense white heat, it has lost all its volatile constituents, and is consequently difficult to ignite, and unless burnt in a strong draught yields a sullen, unkindly fire. It serves excellently for closed stoves, but is quite unsuitable for the open grate beloved of Britons.

Hitherto the cost of making and distributing a partially distilled fuel has stood in the way of its general adoption. Certain economic forces, however, are now at work which will lead inevitably to the introduction of a lightly coked coal as the domestic fuel of the future. Chief of these forces is the increasing use of oil as a fuel, a modern development which is leading many eminent engineers and chemists to ask whether by a more rational use of our coal resources we could not produce in this country

all the oil we require, whilst furnishing at the same time a household fuel more economical and more satisfactory in every respect than raw coal.

The domestic fuel of the future is likely to come to us as a by-product in the manufacture of oil from coal. Already oil is supplanting coal as a source of power in innumerable industries. From its application first of all to stationary engines, and subsequently to small vessels, oil, whether used for internal combustion or for burning under the boilers, has proved itself a safe, efficient, economical, and highly convenient form of fuel.

The adoption of oil fuel by the Admiralty in its latest battleship, the *Queen Elizabeth*, may be said to mark a definite epoch in maritime industry, and the problem now arises as to the possibility of the home production of oil in sufficient quantities for our naval requirements. It is manifestly an unsatisfactory and possibly a dangerous position for this country to be dependent on overseas supplies for the motive-force with which to drive our battleships. Attention is, therefore, being turned in many directions to the provision of a native supply of this prime necessity of modern engineering practice.

For the last half-century the bituminous shales of Linlithgow, Midlothian, and Fife have been distilled for the production of paraffin; but the supply is far below the fuel demands of the present day, whilst the grade of these oils is too high for burning under boilers. The best hope of securing an adequate output of fuel-oil lies in the treatment of coal at a low temperature in 'ovens' designed to recover the largest possible proportion of liquid by-products. By carbonising at a red heat, it has been found possible to produce from a ton of ordinary bituminous coal about fifteen hundredweight of a coke-like residue, and approximately twelve gallons of oil. Other by-products consist of about five thousand cubic feet of a high-illuminating-power gas, a gallon or two of motor spirit, about twenty-four pounds of sulphate of ammonia—the finest of artificial fertilisers—and a quantity of pitch.

If the seventeen million tons of coal required every year by London alone were thus treated, over two hundred million gallons of fuel-oil would be produced, or almost one million tons per annum. As it is usual among engineers to reckon that sixty-six gallons of oil are equivalent to one hundred tons of the best Welsh steam coal, we find that London alone could contribute in liquid fuel the equivalent of one million three hundred and thirty-three thousand tons of best coal—a quantity that exceeds half the entire

fuel requirements of the navy, as per Navy Estimates for 1913-14. The production of this vast bulk of oil would at the same time yield about twelve million tons of a lightly carbonised coal, constituting an ideal domestic fuel. Containing, as it does, about 10 per cent. of volatile matter, it is easy to ignite, and when ignited burns with a cheerful and absolutely smokeless flame. Weight for weight, there would appear no good reason why the low-temperature coke should not be sold cheaper than coal. The purchaser would certainly secure more radiant heat for his money than from an equal weight of coal. It would be better for their purses if householders generally were to acquire the habit of reckoning fuel in terms of heat-units rather than in pounds avoirdupois. The kitchen-range and the ingle-nook would then be viewed from a somewhat different standpoint.

At present the supply of low-temperature coke is limited to those districts in which the process is being carried on. Several collieries, however, are now installing low-temperature carbonising plants, and it is but a matter of time before the supply overtakes the demand and the price of the new fuel adjusts itself to the economics of the case.

There is a national aspect of the whole question which ought not to be overlooked. The conservation of our coal-deposits is of the utmost importance if we are to remain a manufacturing nation, and no process has yet been devised that

is better calculated to prolong their life than the low-temperature treatment above outlined. Though designed primarily to render this country independent of foreign oil-supplies, it has the happy effect of recovering every valuable constituent of the coal, whilst incidentally producing the ideal domestic fuel for which sanitary reformers have so long sighed.

Public opinion is setting strongly against the contamination of the air we breathe with coal-smoke. A general use of low-temperature coke would render the atmosphere of our cities as free from pollution as that of New York, where it is obligatory upon all inhabitants to burn anthracite or some other form of smokeless fuel. Through wantonly wasting the valuable constituents of coal by burning it raw in the domestic fireplace we suffer a double penalty. Not only do we pay directly for the fuel that is discharged unconsumed up the chimney, but we pay indirectly a second time in the labour spent in removing it when it comes back to us through the windows in the form of smuts and dust. We pay, too, in deteriorated health and obscured sunshine.

The whole subject affords an interesting illustration of the solidarity of scientific progress, and demonstrates forcibly the fact that one advance inevitably brings another in its train. The growth of twentieth-century engineering science, which demands oil in ever-growing volumes, is thus tending to promote a sanitary reform which is long overdue.

ADVISERS AND RULERS.

By VERNON RICHARDS.

'DO you know how the Malays poison their enemies?' said my host cheerfully, as he helped himself to a slice of melon. I had arrived only that morning at the capital of one of the more remote and uncivilised native states in the Malay Peninsula, and was staying with the British Adviser, the official provided by a kindly and far-seeing British Government to 'advise' the Sultan, which means in practice to administer the state.

I disclaimed all knowledge of the poisoning habits of the Malays, and the B.A. (as he is called here) explained.

'They invite their friends to eat a slice of melon, and to show there is no ill-feeling they cut a slice for themselves from the same fruit. But,' he went on, demonstrating at the same time with the knife he was using, 'they smear one side of the blade with honey and cyanide of potassium, and take care to offer the guest the slice which has been cut with the poisoned side. They eat the other slice themselves. By the way,' he went on, with apparent irrelevance, 'have you been told that

the Sultan has asked you to breakfast with him to-morrow?'

I said I had, and that I should be very pleased to go. As a matter of fact, I had been shown on my arrival a card covered with Arabic characters, which I was told was an invitation to 'His Highness's faithful and honoured friend who was enjoying the best of health' (I don't know how he knew that); and also a letter already written for me in the same language, which stated that I had the honour to accept the invitation, and took about three pages to say so.

'You'll meet the whole European population there,' said my host. 'We shall number about a dozen, including the ladies. Doesn't it seem absurd that we are practically ruling the whole state—thousands of square miles, thousands of Malays—and only about two hundred Europeans, if you rope in all the planters and miners up the river?'

'And *why* are we ruling it?' I asked.

'Force of circumstances,' was the reply. 'You can't stop Europeans coming here to dig for tin and gold, and where they go law and order must

follow—two things which these native Sultans are quite incapable of enforcing. If they weren't looked after by some other Power they would very soon be deposed and murdered, and the country would be in a state of anarchy. We don't want this place. We could have had it years ago if we had liked. It is still a Malay state, and all our officials are in theory the servants of the Sultan.'

'And you "advise" him. Does he like the advice you give him?'

'I don't expect he does,' said the B.A., laughing. 'I had an instance of that only this morning. You know that this is one of the great Mohammedan festivals, and it has always been the Sultan's custom to release certain prisoners at the feast.'

I nodded. The phrase sounded familiar.

'Well, last year all whom he released had to pay handsomely for the privilege. He must have made an enormous sum out of them. So I wrote to him the other day, and suggested that this time it might be as well to ask the jail superintendent which were the deserving cases. He professed to be delighted with the idea; but I got a letter from him this morning to say that he does not intend to release any prisoners this year. So much for the royal clemency—no money, no mercy.'

'You will see the jail this afternoon,' said Mrs B.A. 'You have to drive over it from the fifth tee, and if your ball hits the tin roof you can hear the prisoners laughing derisively.'

'So you have a golf-course here, have you?' I said, in surprise.

'Yes, and a bowling-green; and we have a piece of ground reserved for a racecourse, but that, of course, is in the dim future.'

The royal breakfast was held in the huge veranda of the Sultan's palace. It was entirely open to the courtyard on one side, and when we arrived, at nine o'clock, it was a perfect feast of colour. There, in their best clothes, sat all the Sultan's sons and brothers and uncles. Every one wore the national costume, and such an array of silks, such a medley of gorgeous colours, I had never before seen. If only they had squatted native-fashion on the floor instead of sitting on English chairs, the picture would have been complete. The more nearly-related sat about the veranda more or less at their ease, and gossiped to one another in an undertone. The lesser people, who did not come to the palace every day of the week, sat silently and hungrily in two weary, waiting rows.

In the background, breakfast was being laid on a raised dais—the 'high table' of an English college—and another table was being prepared for lesser notabilities lower down.

The Sultan received us in the centre of the veranda, and shook hands affably. He also had on this occasion discarded his European clothes, and was in the full Malay costume, which one

seldom sees nowadays except on festivals. He wore a thin jacket and trousers of coloured silk, with a silk *sarong* or native kilt round his waist, and another *sarong* to wrap round his ancestral *kris*. A pair of dusky bare feet gave rather an unfinished look to the costume; but I noticed a pair of carpet slippers under the table, which had evidently been kicked off from the royal toes. The table itself and the chairs round it were cheap modern productions which almost cried out that they came from Tottenham Court Road. A brass vase-shaped spittoon near the Sultan's chair was much more in keeping with his person. After shaking hands with him I joined the row of solemn English men and women, who sat for the most part in silence. If conversation is difficult in the drawing-room before dinner, it is doubly so in a Sultan's palace before breakfast.

'Do you see that benevolent-looking old man over there?' whispered my neighbour. 'We call him the Wicked Uncle. He murdered the last two Sultans, and failed to get made Sultan himself, after all. Hard luck, wasn't it?'

I thought of the poisoned-melon trick, and wondered whether I should have to sit next to him. Presently a Malay servant appeared with a plan of the table in his hand. With all that air of mystery and secrecy assumed by an English host marshalling his guests, he allowed me a furtive peep at it. I found I was to sit at the 'high table' between two of the uncles, one of whom was the Lord Chief Justice. (Mentally I named him 'Koko.') The other uncle I was not introduced to, but I was glad to find it was not the 'wicked' one.

The tedium of waiting was relieved by a sudden outburst of laughter on the part of another of the uncles. This, in that solemn atmosphere, seemed such indecorous behaviour that I looked towards the Sultan to see how he was taking it. But he appeared not to notice it, and it was explained to me that that particular uncle was mad.

'Nobody minds him. He laughs like that at everything one says. And if you offer him your cigarette-case he will take the whole lot.'

But if these be symptoms of madness, then he is not alone in his lunacy.

So we sat and waited, while the attendants round the table got busier and busier, and the rows of relations looked hungrier and hungrier, and the Sultan chatted genially to his adviser in an admirable manner. At length the Chief Butler began to stalk the Sultan's chair from behind. Nearer and nearer he crept, until he succeeded in arriving at it without being seen or heard. Then he squatted down and waited in silence beside it until he should be perceived. I expect that in reality the Sultan knew he was there all the time, but he pretended not to discover him until he half-turned to flick the ash from his cigarette. The servant took the ash in his face without winking, and, putting his hands together as though in prayer, he bowed his head

two or three times, and neatly regained his feet without putting his hands to the floor. Breakfast was served.

The table was covered with dishes containing curried meats of various kinds, while other dishes were handed round; but the groundwork of the meal, so to speak, was a plate heaped up with boiled rice in front of each guest. There was apparently no limit to the number of additions you might make to your rice, and I looked round anxiously for melons; but I could not see even a *kundur*, or native pumpkin. So, with a sigh of relief, I picked up my spoon and fork and waded into my rice.

Presently Mr Koko asked me in Malay whether I spoke that language. 'A little,' I replied truthfully, for I had come out from England only two months before. Our conversation was consequently rather limited, especially as Koko, having opened the ball, seemed to have exhausted his ideas in doing so, and left the initiation of new subjects to me. With the uncle on my left I had no conversation. He sat at the table nursing his left foot on his knee, and I had an absurd longing to tickle the sole of the bare brown foot that was turned so invitingly towards me. Perhaps the knowledge that he was wearing his *kris* restrained me. It is only on such occasions as this, Koko told me, that the *kris* is worn. It was found safer for the general public to make the wearing of it on ordinary occasions illegal, and a genuine *kris* is very rarely seen nowadays. Koko was kind enough to unwrap his *sarong* and show me his, which he said had belonged to his grandfather, and was fifty years old. This kind does not come into the market very easily, but they make a very nice line of old *kris*es now in Birmingham.

At this point the Sultan rose from the table, and we said good-bye and filed out into the blazing sunshine.

'I wonder what they think of it all!' was my comment as we drove home. 'They seem so pleased to see us, and yet they must really hate us for coming into their country and taking the control of it out of their hands.'

'There is one factor in the case you have

overlooked,' said the B.A., 'though I believe he was pointed out to you just now.'

'You mean the Wicked Uncle?'

'Yes. But for us, the Sultan would have been a dead man long ago, and he knows it. Then, again, we do enforce justice in this country, and the ordinary Malay appreciates that. How does Magna Carta run? "To none will we sell, to none will we deny, justice." We have enforced that clause here. Formerly the law was on the side of the longest purse. Now every man can get a hearing.'

'In theory,' I said. 'How does it work out in practice?'

'It depends a good deal on the D.O.' (District Officer). 'If he knows his people as he ought to do, they will come to him when they are in trouble. A Malay will walk miles through the jungle to the D.O.'s bungalow, squat down on the veranda, and send in word that when the *Tuan* is at liberty So-and-so would like to speak to him. Of course no one is ever sent away without a hearing.'

'If the D.O. "knows his people," you say. How does he manage to do that?'

'By walking miles along jungle paths in the heat of the day; by sitting for hours chatting in dirty Malay houses and drinking Malay drinks; by camping out in damp and unhealthy places, and by generally sacrificing himself for the good of his people. Oh yes,' he added after a pause, 'and by being vaccinated. Smallpox is rife among the Malays, and we are trying to make vaccination compulsory. They have no conscientious objections if the *Tuan* gives them a lead.'

'Then do you mean to say,' I asked, 'that a D.O. may have to be vaccinated several times over *pour encourager les autres*?'

'"Several times over" is a weak way of putting it. G—— in —— holds the record at present. He has been vaccinated forty-three times in one year.'

'Thank you,' I said, as the carriage drew up at the Residency. 'Now I begin to understand what people mean when they talk of an Englishman's capacity for governing natives.'

All the same, if a Malay asks me to eat melon with him I shall not accept the invitation!

HOW YOU GET YOUR FURS.

By WILLIAM J. STEVENSON.

JUST about the time when my lady's furs, coat, muff, and all the rest are sent home from the stores, where they have been lying snugly in cold storage—no one nowadays relies on camphor and oil of cedar as safeguards against the all-devouring moth—the trappers of the great fur companies are setting out on their toilsome journey for the great white hunting-grounds to provide the pelts which keep her and her friends

so snug and warm. Far from the haunts of civilisation they lie, these hunting-grounds once sacred to the folk of the wild and the almost as savage Indian or Eskimo. The trackless wilds of northern Canada, the dreary forests and plains of Siberia and Asiatic Russia, the ice-bound isles and inhospitable coasts of Labrador and the Hudson Bay region, these it is that supply the rich furs which my lady loves, and which shield her so

well from the winter blasts. Well they may do so, indeed, for no wind that ever blew in England can compare with the icy breath of those frozen solitudes. There, with the mercury at thirty, forty, or fifty degrees below zero, any living thing—Indian, white man, or denizen of the wild—must needs go warmly clad, or die.

Four big companies, and only four, handle between them practically the whole fur-supply of the world. Despite a certain rivalry which exists, these companies work together to control supplies and prices, especially of the more rare and costly pelts. First and most important is the Hudson Bay Company, dating from Stuart times, and long practically the sole ruler of British North America. Next we may place the Russian-American Fur Company, with its headquarters at Moscow. In addition to Russia and Siberia, this company holds the monopoly of the sealeries of the frozen islands in the north of Asia, of which those of the Commander Islands are the most important. Russian gunboats patrol these continually to keep off the daring seal-poachers—Jap, American, and even British—who occasionally, in spite of everything, make a rich haul. The Royal Fur Company of Greenland, a Danish association, and the great French house of Revillon Frères complete the list. The latter has the exclusive monopoly of no special region, but draws its supplies from every fur-producing country on the globe.

Ultimately, however, all these companies depend for their supplies on the trapper—white, half-breed, or Indian. A wild, fierce life is his, always at war with nature and the forces of the wilderness; sometimes, too, though more rarely now than formerly, with his human rivals, when knife or rifle may be called in to settle the right to some specially promising hunting-ground or cached store of pelts. The autumn leaves will be falling fast when he bids good-bye to the remote trading-post to which he is attached. With only axe and rifle and traps for comrades, he must depend for his food on his hunting-skill, just as do the denizens of the wild against which he must match himself; and, as a hunting animal, not one of them, be it the mighty grizzly or the fierce-eyed lynx, can count itself his equal.

Through the summer he has been busy enough. The skins of animals do not all come to perfection at the same time. Autumn, for instance, is the best time for trapping the beaver and muskrat, before they retire for their winter sleep to the snug-built houses which the trapper knows too well to interfere with. Summer or autumn, too, is the best time to deal with the bear—black, brown, or grizzly. Sometimes these fall to his rifle; but, besides the damage done to the pelt, the last-named at least is a foe not to be attacked light-heartedly. Any hunter will tell you tales enough of the giant grizzly of the Rockies: how, after receiving bullet after bullet through heart and brain, he has yet retained life enough

to avenge himself on his slayer. So traps, cunningly constructed with a gigantic tree-trunk suspended in such a way as to fall and break the unfortunate animal's back, are generally used instead. Sometimes a heavy revolver is so arranged that it will be fired at any animal disturbing the bait. Only the other year a trapper in Ungava was killed while carelessly examining such a trap; and a bear, coming later and endeavouring to drag away his body, also received its quietus from the deadly automatic pistol. Afterwards another trapper found the bodies of both, though the bear had dragged itself some distance before it fell.

With regard to the animals of the farther north, January or February is the time when the skins are at their best. Shooting being out of the question, they are usually taken in steel traps. The ermine, however, is an exception. This little animal—it is really a variety of stoat or weasel, which, like all animals in those frozen lands, turns white in winter—is too precious for any risk of injury to its skin to be incurred if it can possibly be avoided. So how do you think the trapper proceeds? His method is ingenious. When he comes across the tiny dotted trail which shows his prey has recently passed, he takes out his hunting-knife and rubs the blade with a piece of fat, then lays it down in the animal's track, knowing it is almost sure to return. When the little creature comes along, fiercely hungry, as are all the animals during the long winter, it sniffs the tempting odour. Very timid it is, but there is nothing to indicate a trap. So at last, putting out its long red tongue, it licks the blade. But in that intense cold, where a rifle-barrel will peel the skin from the naked hand which touches it, the tiny tongue freezes to the steel and cannot be withdrawn. The knife is too heavy to drag away, and soon the trapper's store is richer by a choice pelt.

More valuable even than the ermine is the fox—blue, silver-gray, or red. A common gray fox skin is worth a dollar to the trapper, and a silver fox will net him anything from fifty to one hundred and fifty dollars. Nor is this to be wondered at, as a fine specimen, untreated, will sell in London for close on four hundred pounds.

Of late years black foxes have been reared on Prince Edward Island, and blue and silver-gray foxes in Labrador and the Aleutian Islands. An old trapper I knew told me that a son of his anticipated this kind of stock-rearing many years ago in Manitoba. The lad had taken several minks alive in specially constructed traps. The mink, it may be worth mentioning, is a species of stoat or marten, and produces a very fine fur, worth to the trapper some five dollars upwards per specimen. The lad tried to rear his prizes in captivity, built a house for them, and found they thrived well and bred freely. For a good many years he derived quite a large income from the sale of their skins. Later, however, he

went to Winnipeg, and the mink-house fell into decay. Ever since, however, trappers of the neighbourhood say that the place has a strange attraction for the wild minks, and that no place far or near offers such good prospects of taking them in traps.

Otter, skunk, wolverine, and dozens of other fur-bearing animals of greater or less value complete the tale of the trapper's spoils. The capture of the skunk needs care. If the trap is not so arranged as to kill the animal instantly, a foul-smelling liquid is ejected, which renders the fur valueless. So well is this unsavoury property known that even the grizzly bear fights shy of the skunk, and no animal, however hungry, will tackle him.

Even the wolf is not despised, though the two and a half dollars bounty on his head is perhaps a greater temptation to his slayer than the skin. Still, if the skin is in good condition, it brings a fair price.

In March the trapper comes back with his spoils. At the trading-post the factor or agent values the skins, and hands over the price. The whites take theirs in cash, the Indians in tallies exchangeable at the company's stores for such things as they require. Each tally is supposed to represent the value of one beaver-skin, and will pass current for one dollar.

A journey of some six thousand miles awaits these spoils of the North. By canoe, rail, and steamer they find their way at last to London or Paris, where the great fur sales are held. Here they are disposed of by auction to the dealers, some twelve million pelts changing hands in London alone last year. Next comes the preparation of the skins. They must be dyed, dressed, and treated in various ways before they can be made up into the costly garments they are destined to become. This is done at Leipzig, in Germany. Practically all the high-class furs of the world pass through the hands of two or three firms there. Jealously guarded secrets handed down for centuries account for the pre-eminence of these firms in this business. Even furs destined to be worn in the lands where they were procured—say in Canada or Russia—take the same long journey before they reach their wearers. This process of preparation is an intricate one, and only the most skilled workmen are entrusted with it. In all, it lasts about a year. It is this fact which accounts for the great difference between the price of the raw furs, costly as these often are, and the finished garment. Even inferior skins—rabbit, for instance—treated by this process, may sell for quite a surprising figure. Sable, fox, sealskin, and sea-otter are probably the most expensive furs. Of the genuine skins there are really very few on the market. 'Sealskin,' for instance, when not coney (rabbit), is almost invariably musquash or musk-rat cut and dyed. A high official of a leading fur-trading firm told me a

few years ago that only twenty-eight genuine sealskin coats in all were produced that year. What their price would be may be imagined.

In fox, whether silver, blue, or red, only small articles, such as muffs, can as a rule be procured, and these are mostly secured by royal personages and American millionaires. A sable coat might cost anything from three thousand to eight thousand pounds. Of sea-otter, too, perhaps one of the loveliest furs of all, the supply is failing. Indiscriminate killing in the past is responsible for this, and now strict measures of preservation are necessary if the species is not to become extinct. Only four hundred skins were brought to market last year. So if you want a sea-otter jacket you may imagine what you will have to pay for it. It is just possible, dear reader, that it may be outside the range of your purse. But, on the other hand, it may console you to learn that four and a half million musk-rat pelts figured on the London lists, while one little lot of house-cat skins reached the tidy total of thirty-five thousand!

A REMBRANDT ETCHING.

THE broad fields stretch to where the dikes oppose
The creeping, hungry sea;
And in their midst a wooden mill outthrows
Its tattered sails in glee.

The land is still. The mighty clouds, which pass
Above the pastured herds,
Frame, as they cast dark shadows on the grass,
A flight of homing birds.

There's many a patch upon the wooden walls
About the mill's warm gloom;
And on the miller's roof a sunglint falls
On grass and weeds in bloom.

This is the homely scene which Rembrandt chose,
That always it might live
Clothed in that perfect beauty of repose
His mastery could give.

He chose it; and I think he loved the best,
And bade his needle trace,
Those marks of simple human toil and test
Which are upon its face.

His boyhood's home was such. To him each wall
Spoke with a message clear;
Sea, sky, and welcoming homestead, one and all,
Made music for his ear.

And so he set it down—the glimmering plain,
The evening calm and still,
The crazy dwelling, and the sails a-strain
Upon the lonely mill.

F. W. SAUNDERSON.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday*.

FROM my upper window in one of the main thoroughfares of this city I see a long line of soldiers come bravely up the street, making the music of its even stepping, for this steady thudding monotone seems to be music now, as with swelling hearts of pride we listen to it. Some are old soldiers, many in the file are new ones, but they are scarcely distinguishable; all are fine and strong and happy. They wait for their turn to go to the battlefields, and then they know they will be happier still, for it is declared, and we believe it, that, with all the trials and the dangers and the fearsome but unfear'd happenings, there are out across the Channel the thrills of the fight and the joy of duty in the full power of British manhood, so that those gun-blown lands are in a sense happier for life than poor, gloomy London. It is hardly good to be anything but a soldier now. Presently, the band being silent, the men of this khaki line, with their faces lit with the great life that their frames embrace, break out into a lusty marching song, and before one realises that a note has been sounded the full company is pouring the melody from its lungs. It is impossible to say where in the line it is started, for in a short moment the chorus reaches its full strength, and how thrilling it does seem! Men who watch feel a little twitching in their nerves, and women must sometimes wipe an eye. This soldier-singing, the like of which has never been heard in London before, stands for such an all. Then the line turns a corner, and the soldier-music fades. In a few minutes another file of men comes marching along, but they are in kilts, and at the head of them are pipers skirling the far northern airs; and all these Scots, with their magnificently proud bearing, do let you see from their manner that, the days of peace being gone, they are going to do their own soldier business now. And it will be done. When one turns away from looking upon these marching soldiers, just waiting in London for their turn to take their place in the fighting lines, one must ponder upon many things, and realise that now, as for the very first time, the crystallised, definite spirit of the Motherland is abroad. It is just that exactly—the Motherland. Not, indeed, that there has been no patriotism, and no strong expressions

of it, in Britain before this day; but they have not been the same in our time. This beloved soil of Britain was not in danger then; and now, when the hosts of the enemy have an ambition, vain but still threatening, to tread with their barbarous feet upon it, we know in our hearts the fullness of our passionate love for our British home, and feel that for the love we could fall down and kiss with our lips this dear earth of ours. The patriotism is out, all are brothers in Britain, and the land is so good to us, so dear to us. This land is England; these are England's trees. See the beauty of the woods and fields, the nobility of the hills, and the sweetness of the dales. Oh the rippling chant of the rivers and streams as they seem to answer the command of David, and worship the Lord as they flow along! Our Motherland! And it is that for which our soldiers are going out to fight, and that which makes them look and be finer, surely, than they have seemed to us before. When did soldiers smile and sing like this? When did their faces bear such a look of fire and ardour, the true look of the brave sons of the Motherland? Yes, it is a fine thing to be a soldier now. Happy is the home that has given a soldier to the armies; noble are the mothers who smile at their departure. And there are soldiers from nearly every home, for it is borne in upon the people at last that this is a time for yielding to the full of the national limb and blood. To every one of us this war has given a comradeship that no other war in our time has ever done. Peer and peasant have alike torn themselves from their loved ones and have grasped rifle or sword. A dear brother of mine, who played with me in childhood days in northern fields and lanes, has left wife and two children to shoot the big guns of the Royal Garrison Artillery. There is another line of them coming along the street, and this time the band is flinging out the music of the challenge of the nation for ages past, and the soldiers are singing—no, not singing, but shouting—'Britons, never, never, never shall be slaves!' How well they will fight for their Motherland!

* * *

There are many matters of great moment to dwell anxiously upon in connection with this war business at the present time; but yet

there are some of us who, having calculated, and not in a way of ignorance, the possibilities and probabilities of the situation, think that it may be over far sooner than other people suggest. And when the time of peace comes, a hundred other new questions of the highest degree of interest and importance will arise, and will occupy the attention of the Government and the newspapers for a long period. But there is one matter that will then absorb the attention of the people as human beings, and not merely as sons of the State, to the exclusion of others, and it is this—that the soldiers, with all their honour and glory heaped upon them, will be coming home again, coming home in the full joy of their victory to the Motherland that they have fought for and saved. Were I an old man, and already being given cause for thinking upon churchyards and the moaning of evening winds through cypress-boughs, I would offer fervent prayers, and get them supported by all that the medicine men could do to keep me living to that day when the soldiers march again down these big streets, for it will be such a thrilling sight and experience of its kind as Britain has not yet known in our day. But when the cheering—poor weak word for what will be!—and the kissing, and the embracing have all been done and done again, the question must come up with a tremendous insistence as to what shall be done for those dear soldiers, the soldiers who have saved the Motherland. Lately we have been occupied with thoughts as to what we can pay them, and what we can give to the wives and the children they have left behind while they have gone to the war. Mean questions these have appeared to be in the way they have of necessity had to be dealt with; for the soldiers have not gone to fight because they had to do so for money, but for love and duty, and often enough the pay that is made to them and their dependants is far less than what they have sacrificed to give their help to the overwhelming cause. What can we give them when they come back again? Cheers, kisses, fervent thanks will be theirs. We will give them love and honour always. The King will review them and thank them from the royal and imperial lips. The Queen will smile with Her Majesty's own sweet graciousness upon them. Parliament will pass votes of thanks also. Municipalities will do the same, and hold public meetings and banquets in honour of their own soldiers. And, yes, every man who fought will have the medal which will be the priceless possession, the honour and glory, of his family through this age and down the next, and for many afterwards while the War of Right and Honour shall be remembered, which will be always. But is there nothing else that we can do for the soldiers when they come home to the land to which they have restored the full sense of safety besides all these things—a goodly lot,

but such trifles, most of them, in consideration of the service that will have been done? Yet the soldiers themselves will not be wanting anything, nor half so much. They will have a divinely satisfied conscience of a great duty nobly done. They ask for nothing more. But, still, cannot we give them something besides their discharge, something such as never has been given to soldiers before, because such a war as this has never before been fought, such a call upon men has never before been made, and such a fearful crisis has never before been reached? This, then, is a time for exceptions in everything, and this idea is substantially signified in the way that the public have of saying among themselves, 'Nothing will ever be the same again; this war will alter the lives of all of us.'

* * *

In rumination upon this matter a number of fancies flit across the mind, and are one by one disregarded because of their being so utterly unconventional, for in the way of honours and rewards, and in the arrangement of public conduct generally, we are still bound round by convention, more so indeed than we were at the time of the last great war which threatened our country a hundred years ago. Yet this is a thing that the present conflict will surely change; and so some of the fancies that are cast aside because they might be ridiculed by the conventionalists, those in authority who have close regard for customs and precedents, come back again for another thought. As against service rendered by large bodies of men, in what way do we honour individuals when they have been of high service to the State? We give them titles. These titles may be empty things in their way, but they do serve for a continual and public recognition of merit. They place a dignity upon their possessors, and it has to be continually recognised by all others. The titled men are marked men. We give titles for many things, and we commonly give the loftiest not so much for services rendered to the State as for the accumulation of immense wealth in business, by which the persons who have gathered it become of great influence. If one man by some inconceivably stupendous service won the war for this country and her allies without the assistance of any others, what kind of title should we give him then? We have none that would be adequate, and something new and unconventional would have to be invented for the magnificent occasion. As it is, titles innumerable will be distributed among the officers in the campaign when it is ended, and richly deserved they will be. But what of the men who voluntarily went to fight for king and country, and who were at least as necessary? Perhaps they would like titles too, since every man loves a title. But, it occurs to one, a country cannot distribute a million or more titles; and if it could, there is no title that

could suitably be awarded to the man who has *merely*—begging pardon of the soldier for that word which is the only one—served as a private soldier, and has not risen above the ranks, perhaps not because he was without special merit, since all cannot do so. Yet is there no title that would suit the occasion? If there is one it should be a military title, for most of these men are soldiers only for this one time in their lives, and they will have pride in remembrance of it. The lowest military title that is used for general social purposes of address, and which is valued accordingly, is that of captain. One refers to 'the captain,' and to be Captain Somebody is to be a somebody. Then, to be out with it, why should not every soldier who has volunteered for this great new army which is saving the country, and who, in accordance with his enlistment, retires from it at the end of the war and goes back to his shop or his works or his office, retire with the honorary rank of captain, which he would hold with pride for the rest of his days? The idea seems absurd, of course. More than a million captains, and many of them shop-assistants, a small proportion little more than street loungers, and yet some of them professional men and business men who have been doing well at their work! In the war they all started equal, and they have in general deserved equally well of their country. But a million captains! And if that were the only price to pay, would it not be well if there were three millions of them? It may be said that such a thing has never been done before, and it is answered that such a war as this has never been fought before. And, again, high military personages may object that to obtain a captaincy in the ordinary way a man must graduate through the service schools at great expense, and serve a long period as an officer in the army, when he will be granted his rank in the usual course of seniority, a slow and costly business. True; and such a captain might never have seen any active service at all, while these million men have come forward voluntarily in the hour of national peril and at enormous risk and sacrifice to themselves. If to do this thing would be contrary to all that deeply cherished military custom and system that has been built up through centuries, and regarded with the strictest respect, it must be remembered that nearly everything in this war is contrary to all previous ideas of military things. What was the Waterloo of a day to the great battles of this terrific struggle which have gone on for weeks? Conventions and susceptibilities in military matters have gone by the board all the way, and they might well do so in this matter. There would be no interference with the military system afterwards, for these men would have gone from the army never to return. There would be no danger from the precedent thus made, because nothing is more likely than that after this there will be no other great war in our time. If objections are

made on social grounds, what a paltry consideration is this when we reflect that these men volunteered to save the Empire, and fought and bled for it in the trenches of France and Belgium! There will be fewer of such objections when this war is over than ever there were before. In the future times of peace everybody would know who these captains were, and how they gained their distinction. And again, finally, if a man may be made a peer for the mere accumulation of business wealth, cannot a humble gentleman be made a captain for fighting for his country, when, had he and his like not done so, there might have been no more place for peers? Fanciful as this suggestion may appear at the first thought, it is one that grows in the mind, as I have found from the fact that those to whom I have first suggested it, and who then smiled, have since written urging me to press it forward.

* * *

There is another thing that has to be said about these fine soldiers who go to fight in the new army, and to whom Lord Kitchener paid a tribute the other day for the wonderful efficiency they had so quickly gained, and that is about the news that we get of those who are fighting, and the lack of news. The question of the Press censorship that has caused so much difficulty in the course of the war is much too wide and deep to be dealt with in the course of a few brief notes. The military necessity of a strict censorship is generally and freely admitted; indeed, it is quite obvious. On the other hand, it has clearly been overdone, and there have been the most extraordinary suppressions of news by which no military purpose could be served. The people have a right to some information, and a gigantic struggle such as this cannot be conducted so much in the dark as it has been. Lately I have been looking through the files of the newspapers of a century back, when the art and science of journalism was in its very infancy, and when the resources for obtaining intelligence and circulating it were as nothing compared with what they are now, and the comparison between the journals of then and now is not so much to the advantage of the latter as might be imagined. They reported the battle of Trafalgar in less time than it took our Admiralty, with its careful reluctance, to give out the full detailed story of the first great battle in the North Sea, in which our ships so much distinguished themselves. At least, when men volunteer their services for the country in her hour of need, they have the right to expect that by some means their families shall be kept acquainted with their whereabouts and what their regiments are doing. Apart from this consideration, which, however great, may be looked upon as being of a private or sentimental character, narratives of thrilling events have been sup-

pressed which, had they been published, would have set the zeal of Young England so much on fire that the need for more recruits might have disappeared long ago. For example, there is the case of the first great transport of Canadian troops from their own land to Plymouth, which stands for such a magnificent display of sea-power and imperial loyalty and enthusiasm as the world had never known before, and, so far as the spectacle is concerned, will probably never know again. Thirty-two thousand of the Canadian troops were on the water for twenty days, and they sailed all the way across the sea in three great columns of transports, some thirty-five ships in all, each the same distance apart and the parallels of the columns being perfectly preserved, the whole covering a vast area of the ocean many miles in extent. The pace of the flotilla was regulated by that of the slowest ship, which was put in front. There were British battleships at the head of the columns, battleships at the back, battleships at the sides; and half-way across the ocean another

great British battleship came up, and, steaming down the passage between two of the columns and then up the other passage, played the 'Maple-Leaf for Ever,' to the cheering Canadian soldiers. Any other ships that came in sight were, if considered advisable, ordered to follow in the wake of this great flotilla lest they should go to circulate the news of the mighty enterprise that was afoot in places where it was not considered good it should be known. And here is the most marvellous thing: those thirty-two thousand loyal Canadians were on the water for twenty days, and not a single life was lost! Thus, so far as death-rates and such statistics are concerned, it would appear that for these three weeks the safest and healthiest place on earth or sea was with that great flotilla! Here, indeed, was the story of an Empire! Never had the sea known such a sight before, and Neptune himself, with ages of wonders of the waters to reflect upon, must have been astonished. Some day the full story of this great achievement should be told. It must be.

THE BRIGHT EYES OF DANGER.

CHAPTER V.—ALARUMS AND EXCURSIONS.

WALTER IRVING had risen early, so I was told. I breakfasted alone, and went to the outside stairs of the inn, where I stood watching the scene. It was all a great change to me, this bustle on the streets, the great high houses, and the press of folk waiting for the Highlanders, for I had been living up till now quietly at home in a Westmorland dale. Now and then I might hie me to merry Carlisle, where I had many friends; but I was soon back at Durrison again, among my horses and chase-dogs. I had seen little of the world there, the nearest approach to fighting being the many wrestling meetings in Westmorland and Cumberland, so that the sense of danger in the air and the crowds of people moved me mightily. I would have given much to have King George's commission and be with my father's old regiment, for I guessed that soon it would be on the edge of adventure.

While I stood watching the crowds the city's fire-bell rang out an alarum, and the streets were flooded with the people who had been at worship. The ministers, so I heard, preached with swords by their sides. No one seemed to know exactly what the occasion was; but while the bell rang out a man leading a steaming horse came up, surrounded by a great crowd of people. The Prince's army, he said, had come within eight miles of the city. He had seen it, he said; and this, the first direct news of the Pretender's whereabouts, put the town in a ferment.

At first there was a great show of valour; but, from what I saw and heard, it was plain

there was an undercurrent. There was a deal of talk of prudence, for those inside the city were far outnumbered by the Prince's army; but I put another and an uglier word than prudence to what happened. In plain speaking, some of the city's leaders were as poor defenders as the old pieces of cannon that they had scraped together from the countryside. Irresolution—to call it by no worse name—was rife in their counsels. At first, when two regiments of dragoons—Hamilton's and Gardiner's—were riding up the Lawnmarket, there was some heart put into the mob. Huzzas were raised, and hats thrown in the air. The volunteers had been drawn up, ready to defend the walls or march out to meet the Jacobites; but there was so little discipline that I saw many women, some weeping, some shrill with abuse, persuading or blustering their husbands and sons into staying at home. A sorry sight this; but worse followed, for an officer, stung to action and ashamed of the scene, led his company off down the West Bow. When he reached the Port, his men, except a few of his own friends, had quietly deserted him, slipping down the closes and side streets on their march.

The day was ruled not by military law but by women and parsons, excellent comptrollers in their own peculiar affairs of the care of home and souls, but indifferent guides in the ultimate resort between men. At the West Port I heard several clergymen begging the volunteers not to venture outside, but to remain and defend the walls. A message came from the Provost in

terms that saved the faces of the officers, who dispersed their men; and, of all the soldiers within the city's bounds, less than a couple of hundred men of the Town Guard and the Edinburgh Regiment marched out to meet the enemy; and if I am any judge, their valour was but skin-deep. The truth is that the whole city had a dismal attack of nerves.

I came back to my quarters at the 'White Horse,' and found Walter Irving in the yard by the stable door. His eyes looked tired, and his long riding-boots were covered with dust.

'Ay, Mr Layton! I was up early, and, as you see'—he dusted his boots—'I have been in the saddle; but where my horse is I dinna ken. I set out to see a kinsman who lives past Corstorphine; but I only got within a mile of him. There's no' a footpath that isna hotchin' with Highland skirmishers and outposts. I just missed fallin' into the hands of as ill-conditioned-lookin' a company as I've a wish to see. Ye see, the Pretender's men are no' a' like Alasdair Stuart, the officer we met on the road. If I had been taken I should have had little time for courtin'. I just managed to jink into a wood and lie low until they passed.'

'And your horse?'

He groaned. 'Man, that's weighin' on me. I liked the beast. I had tethered him to a tree, and ran on, on foot, until I found a hidin'-place. When the coast was clear I went back, but there was no horse there, nor any signs of him beyond his hoof-tracks. He's carryin' some Hieland officer by this time, poor beast. My hope is that he'll break his rider's neck!' He stared at the empty stable, the picture of gloom, and all I could do would not rouse him from brooding.

'I'm no' the best of company,' he said, turning towards the inn. 'Twill be better to leave me to my own device for a day or so.'

He would not leave the house, so I left him moping, and came out, as the evening fell, in search of news or adventures. I watched the Town Guard and the Edinburgh Regiment marching out to help the dragoons who were stationed at Corstorphine, and then wandered idly about. It was clear that the citizens expected an attack would be made that night. The trained bands and a few nondescripts guarded the city walls; but even with me, who knew but little of war, the thought lodged that the defence was a matter with little heart in it. The leaders were silent and dispirited. The magistrates took but little concern with the disposition of the city's forces. The whole business rang hollow and untrue; and I heard afterwards that the Bristo Port, nearest the Pretender's lines, had been left open, without a sentry!

Men's minds were strung to a pitch. It needed but some sudden influence to dissolve their shreds of courage, and this came suddenly in the affair called in derision 'The Canter o' Coltbrig.' The dragoons had made a reconnais-

sance near Corstorphine. On the rebels coming nearer, two or three of their horsemen galloped forward. They were merely scouts, and kept, I was told, well out of range; but from sheer bravado they fired their pistols towards the dragoons. These must have carried their hearts in their boots, for they incontinently wheeled about, scurrying like rabbits to the main body without firing a shot. A pell-mell retreat followed; nor did the cavalry fall back on Edinburgh to defend it, but galloped in a lamentable and needless haste to the open country beyond. The whole of the inhabitants saw them fly along the low ground on the north, pursued by nothing but their own alarums. The Jacobites in the town jeered openly, and the town's-people tumbled clean over the edge of panic. Clamour arose. Crowds collected, as men do in a common danger. It went to my heart to hear grown men shout 'Surrender!' and to see their chalk faces. A meeting was held in the New Church aisle; and, while its members were wrangling, I stood outside with the crowd. A gentleman—I never heard his name, but I remember his gray horse—suddenly appeared and galloped along the Lawnmarket. Here the volunteers were drawn up, and to them he shouted, 'They are on us! They have thousands o' men!' There are some who say that he was a Jacobite. If so, he did his side great service, for his news had the effect of a cannon-shot. Four companies of the volunteers marched up to the Castlehill, and gave up their arms to General Guest. The panic was complete. One solitary gleam of hope remained. The fleet with General Cope's army was reputed to have arrived at Dunbar.

I came back to the inn that night tired out. Walter Irving was not there. Marvelling what business could have kept him so late, I waited as long as I could for him; but I was drowsy, and getting into a comfortable chair in the public room of the inn, I fell asleep as I was, in my boots. How long I slept I know not, but I was awakened by a hand shaking me by the shoulder. It was Walter Irving. He was very pale and hollow-eyed.

'Rouse ye,' he kept saying, and I came to my feet. He took my arm and led me to the casement. It was on the frontier of day, the light just beginning to touch the shadows cast by the tall houses. Through the open casement came a murmurous sound, and then, through it, I heard the neighing of the pipes.

'They are here!' I said. He nodded, listening intently.

The volume of the sound grew steadily. I held my breath. I remember hearing some one snoring peacefully in the next room.

Presently two or three men, in the cocked hats of the Town Guard, came running past. They were literally the forerunners, for in a trice numbers of others came as swiftly as their

legs could carry them. At the sound of their stampede windows were thrown open. I could hear women screaming; doors being opened and hastily shut again and barred; and all the time the sound in the Nether Bow direction swelled and became steady and continuous.

'Come, Walter,' said I, 'let us go out.'

'Not I. Coward or no, I'll bide here. I'm quite content. Ye'll get nothing for your meddlin' but a bullet or a clout from a Lochaber axe. The town is as guid as lost to King George.'

'I have no purpose of meddling one way or the other,' I said. 'But I—I'—

'Ye canna sit still, ye mean to say.'

'I warrant I'll see more outside in the heart of affairs than from a tavern window. I'll risk a clout, as you call it.'

He shrugged his shoulders, as one who would say, 'As you please;' and the next moment, wondering at his caution, I went swiftly down the stairs and out to the street. Scared faces appeared at the heads of the closes; but, considering the occasion, there were few people astir. I made my way to the High Street, and

joined a knot of the town's-people near the guard-house. The sound of the pipes was now so clear that one of the company declared that he knew the tune, that it was 'We'll awa' to Sheriffmuir,' and that he was right glad to hear it. This he said in a loud voice in presence of the Royalist guard! The tramp of feet grew from a murmur to a great noise, the approach of the advance guard of the Highland army. They came rapidly on, in good formation, with drawn claymores and targes, uttering loud and uncouth war-cries, swarming right up the street. There were no shots fired, and indeed I saw no resistance. A Highland officer disarmed the guard, and his men seized the guard-house. I heard orders given for the posting of guards at the ports and round the walls, and by six o'clock in the morning they had lined the streets to await the Prince, and the whole city, except the Castle, was in their hands.

It was but a month since the Prince, without money, without munitions of war, and with but seven followers, had raised his standard at Glenfinnan.

(Continued on page 69.)

CHRISTMAS DAY WITH THE WAR-PLANES.

WHETHER the enemy be quiescent or not, the steady daily tasks of the war-plane men will continue on Christmas Day without change, without rest. Should any of the crews not be ordered to work in the air, there are engines to overhaul, stores to replenish, adjustments, repairs, replacements to make. The war has destroyed every possible chance of Christmas leave among this highly trained and hard-worked corps; and until the Allied flags are flying in Berlin there will be no days of rest for them. Writes Denis: 'Four days since I had a wash, a month from my last bath; but I planed into a rain-cloud yesterday, and my face is not so very dirty.'

Christmas Day on the mid-European plain passes pretty much like any other day since war called our boys out; and beyond the seas and from letters received from the front one may sketch something of the day's possibilities. As the first ghostly gleam of Christmas creeps over the sodden, muddy fields there is the loud rumble of artillery fire; in the semi-darkness a despatch-rider on a motor-cycle roars up to the hut by the roadside which is *pro tem.* the headquarters of the military aerial corps. A few minutes ago the airmen were lying in the shelter of their planes—'There's comfort in coming under the wing,' quoth Denis when rain had soaked the tent and his kit was floating in a pretty puddle—now every one is astir, alert. Those guns are in a new position, the enemy has been moving in the night, and the General will want to know what is happening beyond 'the fog of war.'

Pilots and mechanics move swiftly here and there in the half-light, and the ring of tools making new adjustments, tuning, strengthening, is heard from every plane. 'Nos. 2 and 6,' go the Orders, 'to reconnoitre the enemy's artillery to the north, Nos. 1 and 5 to locate movements to the east and to signal ranges to our guns. Crews of Nos. 3, 4, and 8 to report at once to headquarters for instructions.' A grisly programme for the great Christian anniversary, for the war-planes carry bombs, and there are revolvers, rifles, machine-guns fitted. The crew and No. 7 are missing; a fluky, long-range shell smashed her wing, and down from a thousand feet elevation she fell. Gallant souls—rest in peace!

A breakfast of tea (from an old meat-tin) and dry loaves is taken inside five minutes, there is a roar as of Maxims working at express speed, a cloud of petrol-smoke, a jerk, a hop, and No. 2 is in the air, screwing up and up by a giant spiral before setting his course for the neighbourhood of the enemy's heavy batteries; and before he has completed his second twist, No. 6 has shouted, 'Merry Christmas, everybody!' and his machine too is rising. Nos. 1 and 5 rise less steeply; their action does not necessitate rising to so great heights. The three remaining aircraft are deserted save for the guard of infantry, the while their crews are facing an unshaven captain and a grimy lieutenant for instructions, grinning the while at the luck which has apparently selected them for some specially daring

work. There is a consulting of maps, a study of detailed plans, and the men of the war-planes, still grinning, salute and file out to their machines. 'There'll be a grand wireless lie from Berlin about this,' chuckles Denis.

Only persons who have actually been aloft can appreciate the difficult task of the airman in war-time. Modern methods of warfare have taught the importance of concealment against aerial scouts as against attacks on the level; and a battery of great guns painted neutral colour, with their crews in dull uniforms, is bad to pick out against the neutral tints of fields and woodlands, while battalions of infantry may lie, invisible from above, in any scrub or covert. So down floats the war-plane lower, lower, until a marksman below can fire with a fair certainty of reaching pilot or observer or engine—'Though,' says Denis, 'it's lucky the wings are more generally punctured.' Carefully searching the fields below with his binoculars, the observer is carried over the enemy's country, noting, recording every suspicious movement. A crooning whistle, another, another—all misses—show that the enemy is alert beneath; but where? And is that a straggler wandering alone, or merely the outpost of a hidden column? Soon, however, a quiver among the trees there locates a battery, and out of the dun level more and more of the enemy's position becomes clear. 'To report' is now the object; the observer makes up his notes, folds them together, and fastens the packet and its pennon to a thin sliver of steel. The war-plane is rushing like a swallow back to the Allied lines, to a point at which lookout is being kept for its messages.

Sometimes the routine of being fired at by infantry and artillery is varied by a brush with the eagle-shaped war-planes of the enemy. Then life and success alike depend on the swiftest, steadiest machines. You have seen on a warm day a pair of peacock butterflies engaging in mimic battle, swinging round and round, dodging, twisting, ever rising up and up until they are lost to sight in the sunlit air. On this Christmas Day our troops on the great mid-European plain may see in the cold air a sight not dissimilar, but infinitely larger in scale and full of murderous impulses. For the end of the great climb in mid-air may be a sudden losing of control as bomb or rifle or revolver does its

terrible work, and a five thousand feet drop of machine and crew. But the spectacle is too ghastly to link, even in thought, with our respect for the day of the Great Birth.

Toward sunset the firing slackens off, and the aeroplanes, more like gigantic birds than ever, return to their roosts, the base by the muddy roadside. In our camp four come in early; for the other three, as the night draws in, signals are set. But just as the last gleam of rose dies away there is a rattle in the high heavens, a dim shape is visible, then the engine stops, the plane swings this way and that in descent, and finally alights softly. It is Denis the imperturbable. 'Berlin will tell the world to-morrow,' he laughs; and only a year or so ago he was at school, delighting in the hard shot at goal, the drive to the boundary.

Besides this camp on the Continental flat there are other haunts of the war-plane. In the many training schools and camps some pretence at merrymaking will be observed; but Britain's young men are busy with a terrible task, and have no leisure for amusements. Over the wild North Sea a special type of machine will be patrolling, the best scout of all against the lurking submarine, the bubbles of whose wake are apparent to the observer sitting in safety far aloft. He is waiting, too, in the cold and damp for that threatened airship raid, and will welcome its advent to relieve the monotony of the back and forward flight of his craft. No Christmas joys for him this year.

Even more responsible is the work of the dirigibles flying low over our great cities and their environs. How soft gleams the once busy street, how quiet the once roaring thoroughfares! Hour after hour the aerial patrol glides on its way, the only message from the densely populated area a thousand feet below being the chiming of the hours. A year ago one might have heard the waits singing:

Christians, awake! salute the happy morn
Whereon the Saviour of mankind was born;

but the vigilant watchers above little desire to be reminded of such pleasant, happy things. They are watching against the coming of an implacable enemy, and must not for one sweet moment relax the vigilance of their duty.

THE DRIVING FORCE.

CHAPTER IV.

LUCIEN put out his hand, and as he saw that Henri darted forward; but Lucien's arm fell to his side. He looked again at the woman whose courage was so magnificent. Marie-Felicité drew herself up. She waited one moment—two. The morning was getting on, but none of them

thought of that. The ten men waiting by the bushes might be getting impatient; but who had time to remember them?

'How did you know we were here?' began Marie-Felicité.

'Information was brought to me of a fisher-

man who frequented these villages. I had all along been sure that some one who knew the country well was assisting the proscribed to escape.'

He hesitated over the word 'proscribed.' But it never seemed to occur to him that it was strange that he, the judge, should furnish information to the prisoners.

Marie-Félicité nodded, as though she were supplying the details in her mind. She fastened on but one item of the speech; answered but it. 'Yes,' she said, 'Henri—my Henri—is at the head of the league for helping people persecuted as we are to escape. He has saved more than one hundred lives. One hundred men and women, their wives and their husbands, their mothers, and perhaps their children, bless Henri daily. How many bless you, my cousin, Lucien?'

Lucien heard. His head dropped down. How many in all this wide world blessed him?

Marie-Félicité went on again. She asked another question. 'Lucien de Palud,' she said, 'can you say how many curse you?'

His head bent still lower. He could not say; but he knew they must be many—very many.

He began to speak again. He was like a man repeating a part mechanically. 'As soon as I knew of this fisherman,' Lucien went on, 'I came here.'

'Knowing you would find Henri?' demanded Marie-Félicité.

'Yes,' admitted Lucien.

'Hoping you would find Henri?' went on Marie-Félicité.

'Yes,' admitted Lucien again.

'Did you know I was with him?' she continued.

'I heard of a fisher-lad,' Lucien mumbled.

'And you suspected it was I?' Marie-Félicité demanded.

'Yes,' admitted Lucien; 'I suspected it was you.'

'So,' wound up Marie-Félicité, 'you came of set purpose to betray us both, to do us to death. You have been very successful, *mon cousin*. Both Henri and I are in your power. You can make your revenge as complete as you please.'

She had finished. She swept round; she went back to Henri. 'We await our cousin's pleasure, do we not, *mon ami*?' she asked.

'Yes,' answered Henri, and both of them spoke as easily as if it were a question of no importance at all; 'we await our cousin's pleasure.'

Lucien understood. He had but to open that door, march them out, and deliver them to his men.

All at once it came to him that the sky was very blue without; that the grass was still as green as in the first spring days. A bird began to trill, and he heard its note right within the hut. He stood as if he were dumb. Marie-Félicité seemed to have forgotten him. She was

pressed up against Henri's side; his arm was about her.

Lucien looked—and looked. He thrust his hands into his pockets. His face went white. He did not know himself why he delayed. Then a memory came to him again—a memory from out the far past—a memory connected with the time when Marie-Félicité was little, when they were all three young and happy together. 'There was a second cave,' he said. 'Where is it?'

Marie-Félicité answered. 'The embers on the hearth conceal it,' she said. 'Henri calculated that if you took him away I should have time to conceal myself in it, and that you would never find me.'

'But you showed yourself,' Henri put in reproachfully.

'To die with you,' his wife answered.

Perhaps even yet Lucien did not really know what he meant to do. Perhaps still he might have opened that rough wooden door and delivered his cousin and his wife to the guard; but suddenly all three heard voices without. Marie-Félicité looked at Henri.

'Be brave,' he whispered to her.

Lucien raised his head and listened. He thought the guard had grown tired of waiting, and was coming to see for themselves what might be passing. Suddenly he saw in imagination the scene that would be enacted as soon as the cottage door was opened. He saw Marie-Félicité roughly handled by coarse men; he saw them lay their dirty hands on her; he remembered that she was very beautiful, and the small respect these men would have for beauty in distress.

The picture his mind presented to him was more than he could bear. He had but two minutes—three at the very most. The slope up to the cottage was steep, but then it was only such a very little way. He looked fearfully towards the door.

After all, though he had prided himself that he could, that he would, trample everything, any one, under his feet to get to power and place, he found that there was one thing which he could not do.

'Get into the hidden cave!' he cried to Marie-Félicité.

She heard—understood. Henri heard. He drew in a sharp breath; he put out his arm; he pushed his wife away from him. 'Go,' he breathed, too moved for anything but the one bare monosyllable.

But too big a price can be paid for everything on this earth, even for life. Marie-Félicité threw up her head and looked back at the man who offered to save her. 'No,' she said, 'I will not hide myself and leave Henri.'

Lucien heard. He looked stonily down at her.

She made a few steps across the little room to him; she took him by the arm and shook

him. 'Do you not understand?' she cried vehemently. 'I love Henri. I will not live if he is to die.'

Again Lucien de Palud understood. Again he was baffled—worsted. Marie-Félicité would not even receive the gift of her life from him; it was worthless to her if Henri did not share it as well. His face twitched. He felt how far outside all this he was. He told himself he would leave Marie-Félicité to her fate; he would feast on revenge.

The voices without were growing nearer. The men could not be less than half-way up the slope. Marie-Félicité heard them too. She turned about and went back to Henri. She stood by his side. He bent down to urge her to reconsider her decision; she silenced him with a gesture; and then she stood there, her head erect, her eyes shining, her mouth just curved as though her lips were beginning to smile, while the sunlight, flooding more and more into the room, touched her beautiful hair, and spangled it with points of shining brightness.

Lucien watched. His chest laboured; his breath came in gasps. He leaned over the table; he looked hard at the two before him. It was now or never, and he knew it. He had yet time to save Henri as well as Marie-Félicité; but if he yielded to his better impulses he realised what the consequences would be. At the least, he would be shipwrecking his career, his ambitions; at the worst, he was putting his own head into danger. For the last time he tried to get himself in hand. Revenge was sweet, self-sacrifice mere foolishness. Every man had a right to play for his own hand.

The bird that had been singing before began to trill again. Marie-Félicité looked at Henri. 'In heaven, *mon ami*,' she said to him, as though she were telling him when next they would hear the note again.

Henri smiled down at his wife. 'In heaven,' he said; 'and there will be no more partings there.'

Lucien heard. So even in death they meant to cheat him of revenge! He shot out his right hand. Then Lucien de Palud tried to speak, but his voice failed him. At the second effort his voice rang out—rang out in one hoarse sentence. 'Go, both of you!' he said.

There followed an instant of incredulity—an instant, because the words meant so much, when neither Henri nor Marie-Félicité could take in their scope. The light broke first over her face, the glorious light of a great thankfulness. She did not speak; words were inadequate. She went up to Lucien; she held out her hand. He took it—held it. It was peace now—not war, not hatred, not revenge. The tears came into the man's eyes. He was going to speak, when those voices without pulled him up. They were near—so horribly near. If he spoke he felt that they might hear him.

He threw out his arm and pointed to the hearth. He drew Marie-Félicité that way; Henri followed. The aperture was still open. Lucien could just see into the cave. 'Is there a way out?' he asked. 'There used not to be one.'

'I have had one made,' whispered back Henri.

It was Lucien himself that handed Marie-Félicité in. 'Escape quickly,' he said, and then Henri entered; but as he stepped over the white ashes he looked at his cousin.

'Come with us,' he said.

Lucien smiled sadly. 'Then the guard would search the caves, and they might find this one as well as the others,' he answered.

'But'—went on Henri.

A hand was on the latch of the door. Henri heard its rattle. Lucien heard it. 'You forget,' he whispered as he pulled to the stone, 'I am in command; I shall be all right.'

He made one final effort. He closed the aperture. Marie-Félicité was safe; so was Henri. He bent down; he arranged the white ashes; he looked round; the door was opening. The first man of the guard was within the room. Lucien was about to ask him why he came, seeing he had given no signal, when he saw entering not ten men but twelve. His 'official,' Thoud, had joined the party, and with him was an unknown man. The sight made Lucien realise his own peril. He drew himself up; he walked quietly away from the hearth. 'A cold morning, *citoyen*,' he said to Thoud. 'But why have you come to help us?'

The underling grinned. He did not deign to answer. Lucien looked from him to the other men. They were ranging up behind Thoud, and away from him. They seemed eager to put as much space as possible between themselves and the very man at whose orders they had marched out that morning.

Lucien understood. It was to be a fight for his life. Yesterday his one thought would have been to save his skin at any price; now, though he had lost none of his fear of death, he felt calm. Come what might, he had done that which gave him a new, a great strength.

Thoud began at once. 'Citoyen Commissioner,' he said, pointing to Lucien, 'this is the *ci-devant* aristocrat, Lucien Palud. I denounced him to the head-committee in Paris, and the incorruptible Robespierre has sent you to take my evidence. What better proof can you have than the evidence of your own eyes? See! he set out last night to entrap a suspect. He left his guard behind him. They say they have been waiting close on three hours. What has he been doing? *Nom de nom!*' the notion but just striking him, 'I say this Lucien Palud is himself the supposed fisherman; that he, and no other, has been assisting pestilentials across the lake every night.'

Lucien heard, and the guard heard as well. They at once began to roar, '*À bas les aristocrates!*'

Lucien turned to the Commissioner. 'I raided this hut,' he said. 'I have found no one. It is absurd to say that the fisherman and I are one.'

The Commissioner answered harshly. 'Your conduct is suspicious, *citoyen*,' he said. 'I arrest you, pending further examination.'

Lucien bowed. He knew—no one better—the farce of such examinations; he knew that to be arrested was practically equivalent to being condemned.

He stood still. The men he had brought with him gathered around him; one of them, though Lucien had given him his orders that very morning, tied his hands behind him. Thoud pulled the Commissioner out of the hut, and Lucien knew some fresh charge was being trumped up against him. But he was surprised how little he cared. His world seemed to lie behind those slowly dying wood embers on the cottage hearth. Once he raised his eyes and looked round the little, bare room. The mud walls all at once grew beautiful to him; the small unglazed window seemed to shine as though it were the glorious coloured glass in the little chapel at Palud; the very table he leaned against

ceased to be of coarse, hardly planed deal—it was glorified because Marie-Felicité's hands had rested upon it, because over it her great blue eyes had looked at him, and because, as she turned with him, he could still feel the touch of her little fingers on his palm; and the whole room seemed to be alight because she had smiled at him.

Lucien's face softened, and as he stood there, serene, undismayed, the Commissioner roughly told him to march, and Thoud came up and leered at him. Lucien never had any illusions. He knew from the moment his hands were tied behind him that he was a doomed man.

Thoud, doubtless for purposes of his own, persisted in his accusation that Lucien and the fisherman were one and the same. He produced the identification-book to prove what he said. The very notes that Lucien had written down so carefully were used against him. But Lucien neither denied nor admitted the accusation.

When his trial came he refused to plead. He was content to die—happy to die. His whole mind was filled with, was uplifted by, the thought that he had saved Marie-Felicité and the man she loved better than herself.

THE END.

THE SOLDIER AS WAR CORRESPONDENT.

This war is nothing but an artillery duel.—*Private Homeward.*

One forgets what death is! I tell you we are no better than brutes out there.—*A Cyclist Despatch-Rider.*

THE war correspondent, having been kept in the background during the great war, has been forced to adopt many ingenious methods to supply news for home consumption. How enterprising and ingenious he has been we may never know; but at least he has managed to get news regarding the great conflict, if not always personally from the front, at least from the men who were fighting there; and if the censor of the Press Bureau has taken liberties with the copy supplied, this has happened all round, and everybody is agreed that it is unwise to give the enemy any useful information. The late Lord Roberts, while approving that all military movements should be kept secret, was of opinion that the country should receive more information regarding the actions of the Allies. Some very vivid narratives have come in letters from officers and privates, and from interviews with the wounded in hospital. These narratives of personal experiences, if restricted to a narrow area, are manly and straightforward, as the fighting has been. If lacking in the journalistic touch, this is more than atoned for by their air of reality and truthfulness. An expression, a sentence even, reveals between the lines the ghastly horror of the conflict, which the soldier says has been an artillery duel. It would be a hopeless task to attempt to glean information from German

sources. Some German officers set down the truth in their notebooks, as when one writes: 'This war is horrible. Nobody will ever be able to describe it.' As has been pointed out, the modern evolution of warfare has stripped the conflict of picturesqueness, and reduced hostilities between nations to continuous killing.

An American journalist with great experience in following modern armies has recorded his conviction that the British troops still are, as they always have been, the best in the world. The British soldier feels sure of himself as regards good military training, superiority in shooting, in the use of sword, lance, and bayonet, and in the advance in open order. He has kept his hands clean of the devilry of destruction and atrocity which has imprinted an indelible stain on German militarism. In this most sanguinary struggle in the history of the world, where millions of men have been engaged, a notable feature has been the wholesale slaughter by artillery—by shell fire, the mitrailleuse, and the Maxim gun. In the battles of the Marne and the Aisne men were slain in heaps. One private said, 'It is not war; it is murder.' A wounded officer, who had seen more than half of the battalion which he commanded swept away by mitrailleuse fire, said, 'This is not a war of men. It is a war of machines. We are soldiers, not butchers. A battlefield should not be an abattoir.' With appalling suddenness these automatic death-dealers carpet the earth with dead.

Hundreds have been killed without seeing the enemy or having a chance at reprisals. 'If this be civilised warfare,' says one, 'then civilisation had never so much to answer for.' 'And yet,' as one correspondent points out, 'it is the man who counts.' 'Every battle,' an officer said, 'is won by the bayonet in the last issue.'

The fleet need not be forgotten, which made our safety possible. A writer in the *Times* suggested a sentiment for British children in war-time: 'Thank God and the British navy for a good dinner to-day.' A doctor at the front wrote home to his wife: 'When you get this letter, fall on your knees and thank God that our homes are safe on an island, guarded by a powerful navy'—

This fortress built by Nature for herself
Against infection and the hand of war. . . .
This precious stone set in the silver sea.

'Hell with the lid off' is how an officer of the 12th Lancers described what he had been through. There have been curious adventures and misadventures, and narrow escapes from the eccentric behaviour of bullets, every one of which did not find its billet. A wounded British soldier in a Paris hospital showed a visitor a pocket Testament. There was a scar right across the cover. During an engagement, the book, which was in his left breast-pocket, was struck by a bullet, which glanced off, striking him in the neck. Instead of entering the neck it cut a track about three inches long, which was now healing. Naturally the soldier had decided never to part with the little book. Four men of the Royal Scots had a curious escape from one of the 'Black Marias,' as the howitzer-shells are called. Two of them were flung head over heels by the explosion, while two others were, without being hurt, tossed into the excavations made in the ground by the shell. A shrapnel-bullet hit a soldier, and would have been fatal but for his tobacco-tin, which deflected it. Another man was saved by his tin of bully-beef. One was shot in the mouth; the bullet carried away most of his teeth on one side, and passed out behind his ear. A battery of Royal Field Artillery was shelled in the early morning while the men were breakfasting on porridge. One of the shells smashed the porridge-pot after only three spoonfuls had been taken out. A British cavalryman in France had three narrow escapes. While his company was being forced back by artillery fire, a shell fell under his horse without exploding; another time, while they were being shelled out of a village, his horse was grazed by a fragment of shrapnel and lamed; a sharpshooter missed him, but the bullet went through his rifle-bucket and flattened itself on the nozzle of his rifle. A fourth time, after being shelled for six hours in a village, where the houses were demolished like packs of cards, the company had to retire one by one over a pontoon bridge; and a shell burst and killed the man crossing behind him. Lieutenant F. Longman, of the

Royal Fusiliers, son of Mr C. J. Longman the publisher, had a bullet through his right arm, one through his left sleeve, another hit his pistol-holster, another went through his puttee, another went through his Burberry without touching him. Later, we regret to note that he was killed. One officer thought he bore a charmed life, as a bullet went through the elbow of his jacket, another through his equipment, and a piece of shrapnel found a lodgment in a tin of bully-beef which was on his back. While under a continuous Maxim fire in the trenches a soldier read aloud from *Marmion* to keep up the spirits of the men. A French bugler, who died of wounds received at the battle of Lunéville, was struck by four balls, and had his arm blown off by a shell, but he continued heroically to sound the charge on his bugle until he fell exhausted by loss of blood.

The Germans fear the British bayonet, and many have been stabbed in the back; the British private fears the artillery more than the rifle fire of the Germans.

A correspondent, writing of the rout after the battle of the Marne, says: 'It was a strange and terrible experience. All along the route death and destruction—dead men, dead horses, villages in ruins, railways torn to pieces, telegraph wire scattered over the bare fields; here a great water-tank, hurled from its base, lying derelict amongst ruined haystacks; there a transport-wagon, its wheels smashed, leaning giddily over the bodies of the brave men who failed to save and refused to leave it. Farther on a reaping-machine, its work half-accomplished, beside the decomposing carcasses of its team. And away to the eastward a red glow against the heavy cloud-wrack, lurid and menacing, marking the grim work of the scavengers by fire of the battlefields of Sézanne and Meaux.' Near La Ferté Gaucher, in a château pillaged by the Germans, the dining-room table was found heaped with the wreckage of a drunken meal. There were empty wine-bottles all around, and across the table was a crimson splash from an overturned tureen of beetroot soup. The telephone was smashed and the gramophone records trodden under foot. Another château was reduced to a shapeless mass of stones and sticks, mingled with broken crockery and furniture and uniforms of French and German soldiers. Some hillocks close by showed where the dead had been buried. In another house German officers had evidently just sat down to dinner when surprised. On the table were three plates of lentil soup served from an ancient Sèvres bowl. The champagne poured into ordinary cups had not been tasted. Raw ham and sausage, and plenty of black bread, lay uneaten. That the fumes of the French three-inch shells have an asphyxiating effect in an enclosed space was thought to be proved by a scene which met the eyes of the French when they entered a château occupied by the Germans, which had just been bombarded. On entering

the drawing-room they found a company of Würtembergers petrified in action. Some were standing at the windows taking aim, with their fingers still pressed on the triggers; others were playing cards and smoking cigarettes. An officer was standing with his mouth open in the act of dictating an order. The figures looked absolutely lifelike, and had preserved the positions which they had occupied scarcely an hour before. The German howitzer-shells are nicknamed by the British soldier 'coal-boxes,' 'Black Marias,' and 'Jack Johnsons,' because on impact they send up a column of black, greasy vapour.

A motor-cyclist despatch-rider said he had counted six hundred shells falling in a small space within three-quarters of an hour without killing a single man. On the other hand, a private who was in the trenches at Mons said, 'People who say that the German artillery fire is no good simply don't know what they are talking about. I can only figure it as being something worse than the mouth of hell.' And the despatch-rider already quoted said the men when in the trenches, with shells bursting around them, became mere machines. They got thoroughly dehumanised under the continuous fire, which he believed was the only alternative to going mad. They forget what death is. 'I tell you we are no better than brutes out there.' German soldiers carried bombs of various sizes, and each soldier was supplied with a quantity of small black discs little bigger than a sixpenny-piece, composed of compressed benzine, to start fire after the use of an explosive. A great array of automobiles, military motor-cars, and motor-cycles played an important part in the methods of communication. Efficient field-telephone and telegraph systems were also installed. It is said that a peasant ploughing in a field near Melle was shot for accidentally wrecking an underground wire. The use of the aeroplane, and the information gained thereby, have saved thousands of lives to the Allies.

Some of the most illuminating things regarding the Russians engaged in their wonderful campaign in eastern Europe against Austria and Germany have come from Mr Stephen Graham.* He knows Russia well, and the dwellers there, as he has lived amongst them as one of themselves. He tells us in a communication in the *Times* that Moscow at one time was receiving in the course of each day five thousand wounded, and that during the war the number might run up to a million. When he visited one of the hospitals not one in twenty of the wounded was lying in bed. Every hall was full of gaiety and life; soldiers were walking about in their white under-garments, talking, reading, laughing, or playing cards. He saw many men with bandaged legs, hands, heads,

and bodies, with feet stuffed into hospital slippers. One wounded man had only his boots and cap whole after the fray; all the rest of his clothes had been cut and torn to bits. He asked a young Russian officer how it felt to be under fire. He replied that it was at first unpleasant, but after a while it became even pleasant, exhilarating. 'One feels an extraordinary freedom in the midst of death, with the bullets whistling round.' The wounded all wanted to get well and return to the field. The Russian forward movement is sometimes accomplished to singing. The Germans did not seem to like the songs of the Russians as they fought. The young officer thought that there was great beauty in so going into action, with songs on their lips.

In this great modern war extraordinary things have happened. Among the captures were an air-ship by a destroyer, a steamer by a seaplane, and another vessel by a submarine. Off the coast of Belgium, ships and submarines, air-craft and land artillery, were all engaged in fighting one another.

Dr Sarolea doubts whether in the whole of human history there has ever been such universal and harrowing suffering concentrated into so narrow an area, condensed in so short a time, as took place in Belgium. These atrocities included the shooting of civilians. There have been instances of field doctors having been shot, and the shelling of hospitals. To these have to be added the destruction of Louvain and Visé, Malines and Namur, Dinant and Termonde, and the shelling of Rheims Cathedral.

To set over against this gruesome side of war we have the skill and compassion of doctor and nurse shown to sick and wounded by the Army Medical and Red Cross staffs. Sir Frederick Treves, who visited the hospitals which received British wounded, considered the American hospital at the Lycée Pasteur as the best of its kind in Paris.

An officer of the R.A.M.C., who was once under fire, described it as 'like hell.' In lying down to escape it he felt like a drowning man; the whole of his life passed vividly before him. He saw his people at home, spoke to them, and also saw the future, and wondered when a piece of shell would come and end it all. A member of an ambulance corps serving in the French army described how, as the din of battle grows less and night draws on, their task begins. With acetylene lamps to light them, the members cross the battlefield in all directions and pick up the wounded. The dead may be very numerous, lying as though petrified, in their last attitude. The crying and moaning of the wounded come poignantly to the ear from the cornfields and damp meadows. The rifle-bullets seemed nearly always to go right through, the wounds in the chest and abdomen being fatal. In other parts, however, unless a bone is broken or some organ pierced, there is always a chance of recovery. A shrapnel-bullet is more

* His journey as a Russian pilgrim was the subject of an article here, 'In Pilgrim Garb' (1914).

dangerous, as it may carry a mass of extraneous matter with it, of trouser-leg or dirty sock, into the jagged wound, which may thus be poisoned.

As has often been pointed out during this great struggle, the German troops had been encouraged to believe that the Russians were backward, the British contemptible, and the French an outworn race, none of which things was true.

A British officer of considerable experience at the front expressed the opinion that the German army itself, except for its overwhelming numbers and the undoubted skill of the general staff, was no match for the British, as on each and every occasion, in his experience, when the latter had met their enemies, they had outmarched, outmanœuvred, and outfought them.

THE MONTH: SCIENCE AND ARTS.

THE HYDRAULIC MINING CARTRIDGE.

CONSIDERABLE development appears to have taken place in the hydraulic cartridge for mining and excavating purposes in confined places, where the use of explosives is either dangerous or difficult. Although many attempts to supersede the latter method have been made, few of these appear to have met with practical success. It was for this reason that an effort was made to utilise hydraulic energy for such work. The system is novel, and during the past few years appears to have been considerably improved, so that it may now be regarded as a really practical and effective weapon. The hydraulic cartridge consists of a steel cylinder containing a number of small pistons which move at right angles to the longitudinal axis of the main cylinder. These pistons expand on the application of water, which is injected by means of a hand-pump. A hole is first drilled to a sufficient depth to receive the main cylinder, which is inserted, and then the hand-pump is set to work, and the tiny pistons expand, their free extremities bearing against the mass of rock. The effect is so great that the rock is gradually fractured under the tremendous pressure. The outstanding advantage of this system is its perfectly safe application, combined with its effectiveness. Moreover, blasting by this method is cheaper than the ordinary method, while greater areas may be disintegrated and excavated at one operation. The cartridge is applicable under conditions where ordinary blasting would be impossible, such as in submerged positions. It has also proved highly useful in the breaking up of concrete foundations, where the conditions are somewhat exacting, inasmuch as a concrete mass is able to withstand a considerable amount of compressing or crushing action before it will yield.

AN INDELIBLE INK.

In workshops and workrooms where dampness exists or where chemical fumes are present, it is sometimes difficult to make labels adhere to vessels to which they are attached, with the result that difficulties occur, and even serious accidents. These may be avoided by using an ink which can be prepared inexpensively and

readily. It comprises a solution made up as follows: shellac, 20 grammes dissolved in a hot solution composed of 30 grammes of borax to 400 cubic centimetres of water. This mixture should be filtered while hot. Another solution, containing 8 grammes of aniline black, 0.3 gramme of tannin, 0.1 gramme of picric acid, and 15 grammes of ammonia dissolved in 10 grammes of water, is prepared. The second solution is added to the first while the latter is still hot. The ink thus prepared works freely, produces a strong inscription, and will be found to resist the action of dampness and chemical erosion.

WAR V. INVENTIVENESS.

While war is undeniably the greatest curse to civilisation, it is not without some compensations. It acts as a decided stimulus to inventive effort, not necessarily in the interests of destruction, but of economics. One of the greatest boons of to-day, synthetic butter—or, as it is more commonly called, margarine—was directly attributable to war. Napoleon III., realising the position of his numerous poorer subjects, and the fact that they could not afford to purchase butter, concluded that it would be better for them to consume a wholesome and nutritious substitute in preference to a dangerous and adulterated article. The outcome of this was the concentration of the efforts of Mège Mouries upon the solution of the problem, which culminated in the perfection of a process for the manufacture of margarine from animal fats. To-day one is able to appreciate the significance and economic value of the illustrious Frenchman's discovery. Margarine is in favour throughout the world, and its production is one of the most prosperous industries. The manufacture has undergone extraordinary development, and has led to still further remarkable conquests of science, especially the superseding of animal fats by nut oils, which have been rendered tasteless and odourless. At the present time there are possibilities quite as golden as those in 1870. The man who succeeds in reducing the cost of manufacturing sugar, even by a halfpenny per pound, will be appreciated by humanity at large. If he can evolve a practical and inexpensive means of manufacturing this commodity from the

common root vegetables he will have achieved a greater success; while the discovery of a synthetic sugar which can be sold at half the price of the natural article will bring him a tremendous fortune and an imperishable record on the roll of fame. The discovery of a non-intoxicating beverage that may be sold profitably at one-half the price of the ordinary beers, and yet have the characteristic flavour of the latter, will also bring undying fame. Mercerised cotton has wrought a widespread revolution in the textile trade, and an equally striking effect will be produced by the man who perfects the means of producing a cheap artificial wool. The margarine of to-day is as dissimilar from that of 1870 as chalk is from cheese, a result due to the wonderful concentration of energy for which the achievement of Mège Mouriés was directly responsible.

THE ELECTRO-MAGNET IN SURGERY.

The shrapnel-shell is the alpha and omega of warfare to-day. The havoc it inflicts is indescribable, the flying splinters and the bullets it contains striking down everything within range. Soldiers have suffered terribly from its effects, and the extraction of the splinters is a supreme ordeal for the surgeon. A French surgeon has called electricity to his aid in this work, and at a recent meeting of the French Academy of Science Dr A. Dastre explained the success which had been achieved thereby. Electricity in the form of a powerful electro-magnet has been employed for some time past by a well-known Swiss oculist for the removal of steel particles from the eye. Its application to general surgery, however, is more recent. Professor Rolet, who is exploiting the idea, has achieved widespread success with the electro-magnet, having withdrawn splinters of shell from the human body at a depth of six inches, and steel-jacketed bullets from a depth of two and a quarter inches. The process is rapid and clean, while it has the advantage of achieving the desired effect without recourse to the knife and with the minimum of pain. Dr Doyen has attracted much attention by his discovery of an antitoxin for tetanus, whereby the mortality from this dread disease has been reduced almost to the negligible. It is interesting that these discoveries of inestimable benefit to the wounded have all been made by French scientists.

GAS-LIGHTING BY SWITCHES.

One of the great advantages of electric lighting is the facility with which the light may be switched on and off from a point near the entrance to a room. This convenience makes electric light preferable to gaslight, which involves the use of matches and ignition and extinction of the light by the manipulation of a tap near the burner; but this has been overcome by the automatic lighting and extinction system, so essential for domestic purposes, which is con-

trolled from a distant point and operated in the same way as the electric-lighting switch. In this system electricity has to be utilised, which is provided by a six-volt battery, and the *modus operandi* is not very dissimilar from that of the electric bell. The igniting device is placed immediately above the gas-burner. There are a copper ribbon and two small insulated copper tubes, called a 'spitfire' igniter, which are attached to an insulated block or two-way piece on the controller. These convey both gas and electric current to a small bunsen-head connecting the tubes, these last being bent so as to bring the head about half-an-inch below the incandescent gas mantle. This bunsen-head contains a small coil of hard-drawn platinum wire, and is placed in the circuit of the six-volt electric battery, together with the switch or push, which may be placed at any convenient point. When this push is depressed the electrical circuit is completed, and the platinum wire is raised to incandescence, producing a white-hot, sharp-pointed flame, which, coming into contact with the gas issuing from the burner, causes ignition, but without the explosion that results when the gas is ignited with a match. Consequently there is no risk of shattering the mantle. One electric battery will suffice for all the lights in a house, with a switch for each light or group of lights. This system dispenses with the ordinary bypass; and although the gas continuously consumed by the bypass may appear to be insignificant, yet in the aggregate it amounts to an appreciable volume and value in the course of a year.

THE WONDERFUL 'SEVENTY-FIVE.'

No gun used during the present war has been the subject of so much interest as the seventy-five millimètre, or, as it is termed affectionately by the French soldiers, the *soixante-quinze*. This is a light artillery field-piece, the design of which was kept a secret by the French Government. It is admitted by the artillerists of the world to be a wonder of gun design. Its outstanding features are the velocity of the missile and the rapid fire. The gun throws a three-inch shell weighing about fifteen pounds, the projectiles hurled being either bullet-shaped with distance-limit rocket or explosive, the latter being charged with mélinite. The shell strikes the ground at a very sharp angle, owing to the flatness of its trajectory, and immediately rebounds, and as it explodes with terrific force it hurls the contents and splinters forward over a wide area, mowing everything down. It is this mowing effect which has wrought such havoc among the massed German formations. In fact, it is possible to clear a thousand square yards of every exposed form of life in about ninety seconds. The rapidity of fire is astonishing, it being possible to discharge twelve rounds in twenty-five seconds. The Germans have a gun of similar calibre—seventy-seven millimètres—throwing a shell of similar

weight; but its rapidity of fire is less, while, owing to defective ammunition, the damage wrought is infinitesimal. It is its rapidity of fire and the havoc wrought by the *soixante-quinze* which render it such a fearsome weapon. The system of recoil is of the very latest pattern, which works upon a principle closely allied to that of the ordinary bicycle-pump. In one engagement a battery of these terrible engines of destruction hurled around three thousand five hundred projectiles in three hours. The gun has proved extremely deadly in what the French term *raffaële* tactics.

RAILWAY PROGRESS IN SCOTLAND.

Some highly interesting particulars concerning the progress of railways in Scotland were narrated by Mr Benjamin Hall Blyth, M.A., in the course of his presidential address before the members of the Institute of Civil Engineers. In 1864 there were two thousand one hundred and five miles of railway open for traffic north of the Tweed. Fifty years later this mileage had increased to three thousand three hundred and two miles. During the fifty years under review the capital invested in the railways had increased from forty-seven million seven hundred and fifty thousand pounds to one hundred and eighty-five million pounds, while the number of passengers had risen from twenty millions two hundred thousand to eighty-eight millions seven hundred and fifty thousand per annum. Locomotives and rolling stock also had increased considerably in weight during this interval; since, whereas the locomotive of 1864 turned the scale at sixty tons, that of to-day weighs one hundred and twenty tons. So far as rolling stock is concerned, the augmentation of weight is even more startling, inasmuch as in the first-named year it was only five hundredweight per passenger, whereas now it is three tons per passenger.

A NEW RAILWAY BUFFER.

Entering a railway station with a heavily loaded train when the rails are slippery probably constitutes the most difficult problem which the driver of the locomotive has to face. At times the train cannot be pulled up within the allotted distance. Crashing into the buffers, it mounts the platform, causing considerable damage, if not loss of life. In order to meet such conditions many ingenious stops have been devised. There is the hydraulic system, with stops mounted upon long cylinders which in reality are the pistons of hydraulic cylinders. When the train crashes into the stop the buffers give way, though with increasing resistance, thereby bringing the train to a standstill. The pneumatic stop works upon a similar principle. A modification of the latter idea has been perfected recently. The stop itself is mounted upon a kind of heavy carriage which slides along the rails. When a train strikes this stop with a

velocity exceeding a predetermined limit, the pneumatic stop is not only driven into its cylinder but the whole carriage is forced along the metals, the increasing friction serving to arrest the momentum of the train. In a recent test it was found that a train travelling at three miles an hour and weighing some eight hundred tons was brought to a stop by the buffer alone; at a speed of four miles an hour the stop-carriage was pushed nine inches along the metals; at eight miles an hour the displacement was three feet; at thirty-two miles an hour it was moved a distance of forty feet. It may be pointed out that although the stop serves to pull the train up within the shortest possible distance, no damage whatever is inflicted on the train, and the passengers receive no inconvenience from the impact or collision with the stop.

THE UTILISATION OF BY-PRODUCTS.

The events of this year make it clear that every discovery of new food-stuffs for man or beast will be of special benefit to humanity. Owing to the great war and the withdrawal of so many men from agricultural pursuits, there are unmistakable signs that there will be a shortage in our supplies of food for cattle. This can be remedied to a much greater extent than hitherto by making use of the refuse and by-products from our numerous large breweries, which is made possible by the employment of a system devised by Professor Barton Scammell, M.S.C.I., one of our leading experts on the chemically intrinsic value of food-stuffs. Briefly described, the process consists in reducing the by-products to a fine impalpable powder, which is then mixed with a solution of radio-phosphate of potash, and pressed into cakes; the action of the radio-phosphate being to assist the assimilation of the food-stuffs by the digestive organs of the animals, and to promote healthy and vigorous growth. The importance of this process may be more clearly understood when it is known that from one brewery alone the quantity of refuse by-products amounts to over fifty tons each week, which, instead of being burnt or put on the soil as manure, is now utilised in a far better way, economically considered, and to the advantage financially of both the brewers and the users. The value of foods depends, apart from flavour and digestibility, on their chemical constituents. A remarkable instance of this is sugar. The war existing in the beet-growing countries, and the consequent shortage in the supply of beet sugar, have again brought into prominence the importance of cane sugar. The analysis of cane sugar shows that, in addition to a better value in saccharine matter, it contains a small percentage of silicon, in a special form, which is entirely absent in beet sugar. This compound of silicon goes to form a strong enamel for the teeth; and children in particular should be

supplied with cane sugar in preference to beet sugar, the result being that their teeth would be of greatly superior quality, and, the enamel being thicker, they would last much longer in adult life. The increased consumption of cane sugar would benefit the nation's health and increase the prosperity of our colonies and oversea dominions. *Scientia omnia revelat!*

AN 'EVER-READY' DRESSING.

Injuries to life or limb form the saddest chapter of mining experience, and the numerous plans for their mitigation or prevention have deservedly occupied a great amount of attention. A large percentage of permanent injuries arise from slight wounds in either the legs, body, or arms becoming poisoned by the entrance of dirt, which sometimes necessitates amputation. To combat the evil of blood-poisoning, a new ever-ready ambulance dressing has been placed on the market. The dressing takes the form of a single bandage, having a suitable piece of boracic lint sewn on at equal distance from each end. The bandage, instead of being rolled, is neatly folded on either side of the lint, which enables it to be more quickly applied to the wound. As a result of recent legislation all underground stations in coal-mines must be supplied with ambulance requisites. In mines the ordinary requisites become readily soiled, and are therefore useless for dressing a wound. What the makers of the 'ever-ready' dressing had in view was something which would serve as an immediate 'first-aid dressing' for use in minor accidents in mines, engineering works, &c., where the exclusion of dirt was the first consideration. The dressing is made up under the most aseptic conditions, and when finished is sealed in an envelope; thus it is kept absolutely clean till the moment it is required. The pink lint does not need wetting, as it is thoroughly saturated with a healing and cleansing agent in the form of boracic acid, and as this comes in contact with the wound it has an immediate beneficial effect.

ROYAL AUCTION BRIDGE.

Mr W. Dalton has lately brought out the third edition of *Royal Auction Bridge*. Besides being thoroughly up to date in the way of new rules, counts, and leads, the work contains many other items of interest. Mr Dalton says: 'No sooner does one card game seem to be thoroughly established, no sooner do we begin to appreciate the niceties and intricacies of it, than some new game is sprung upon us, and—pouf!—out goes the old one like an extinguished candle. Whist had its reign of supremacy; then bridge looked like staying with us for a long time, but in its turn it has been killed by its own degenerate offspring, auction bridge. The old auction bridge was never really a good game. It was fascinating at first, but was spoilt by the overwhelming value of the "No Trump" call. It was left to America

to introduce a new variation of the same game by bringing the values of the different suits closer together, and inventing a new call, "royal spades" or "lilies," which is simply a spade suit with the value of nine points per trick, the old value of two points being done away with altogether.' What is the origin of the term 'lilies'? Mr Dalton gives us an interesting bit of information. He says the origin of the term is doubtful, but one account of it is that when the new count was first introduced in a club at Boston, one of the players said, 'If we are to have a black royalty, let us at least have one from our own country. I make "one Liliuokalani," the dethroned queen of Honolulu.' It is said that from that moment royal spades were called 'Liliuokalanis,' or 'Lilies' for short. The new system was formally adopted by the Whist Club of New York early in 1912. It was, however, played in America for some time before that, and also at the Travellers' Club in Paris. It became popular in England in the latter part of 1912, and gained ground very rapidly. It is a game where the holder of high cards must win; no amount of skill can prevail against aces and kings. Its most ardent admirers cannot call it a restful game; it is not to be recommended as the solace of a peaceful old age. It is all rattle and rush and hurry. You have to be on the *qui vive* all the time, with all your wits about you, and there is no time to exchange courtesies with your neighbour, and scarcely time even to light a cigar. It is essentially a modern game, in keeping with the restless spirit of the present day.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

A NEW YEAR GREETING.

GOD bless for thee the new year's days—
The winter frosts, the budding Mays,
Summer's glad carnival of flowers,
And autumn's harvest; all thy hours,
God bless for thee.

God bless all sights unto thine eyes,
Even the clouds across the skies;
May night make beautiful for thee,
With stars, her dark infinity.

God bless the labour of thy hands
Till all seem good that life commands,
That so the soul-light in thy face
May gladden many a shadowed place.

God bless for thee those times of stress
When human aid is powerless,
And human comfort all in vain;
God give thee peace and joy again.
This, and all other years to be,
God bless for thee.

C. FARMAR.

Chambers's Journal

SEVENTH SERIES

PEDRO'S WAY.

By G. TREVOR ROLLER.

CHAPTER I.

THE sun beat down on the little Mexican town; the whitewashed walls of the houses looked yellow, the sky above dark blue. Not a breath of wind; nothing to relieve the blinding heat. On the outskirts of the town, where the wide, cobble-paved street suddenly ended, sat a lame beggar. He was propped with his back against the last house. The overhanging roof afforded some shade; but for professional purposes, or because he liked it, he had thrust his painfully obvious lame foot out into the sun.

The street was deserted, for it was high noon. Even the children seemed to avoid the intense heat. Out in the desert a man was riding toward the town. The beggar, lazily watching him, also pitied him for his exertions, for the man was riding hard. His pony was going at a good strong lope, beating up the alkali dust around him, dodging the cactus clumps.

A man in a hurry in the heat of the midday was unconventional. The beggar groped for his crutch and arose; here perhaps was something happening. The horseman, obviously a cowboy, clad in tight-fitting blue trousers and white shirt, headed straight for the beggar, pulled in to a walk, and, 'Is this the Calle de la Tran?' he asked.

The beggar, with a graceful sweep of his right hand, pointed to the name-plate on the other side of the street. 'Truly,' he said. 'The *señor* can see for himself.' His elbow came to his side, his forearm at right angles to his body, his palm outstretched. Certainly this man was a *peon*; but he owned a horse, also a saddle, possibly *centavos*. Anyway, there was no harm done.

The horseman looked at the name-plate, then at the beggar. 'Ah, *señor*,' he said, 'you have the advantage of me in that you can read. But tell me, where is the house in this street of one Ignatio Galvan?'

As he said the name a look came into his face that the beggar liked; it spelt 'something doing,' so, with great relish and a tap of his crutch, he indicated the house against which he was leaning. 'In this house, *señor*,' he said, 'lives Don Ignatio.'

The horseman dismounted and came toward him, letting the two separate reins fall to the ground.

'Certainly he is worked up,' thought the beggar, for out of the man's dark face peered a

pair of anxious, fierce brown eyes—the eyes of a hunter rather than those of the hunted, not wicked, only eager, vengeful.

'Tell me,' the man whispered, 'is he in that house now?'

'*Si, señor*,' nodded the beggar.

'And alone?'

'Always alone,' the beggar went on; 'his wife went back to her people at Tamez some months ago. She did not like the way Don Ignatio has of carrying on with other girls.'

A half-dollar changed hands; then the horseman took hold of the beggar's arm, and the beggar winced. 'Listen!' he said. 'There are things I would say to this Ignatio Galvan that would not be good for you to know. It would not be good for you to be here when I come out. So go! Practise your calling in another street. Forget that you have seen me until I am five minutes from this town. Five minutes is all that I ask.'

The beggar cringed and leered. 'Ah,' he thought, 'this Ignatio has overdone his gallantries amongst women. He at last has reached trouble.' So he leered and cringed, swearing by the saints that he would neither see nor hear anything. Then, with many blessings and salutations, he hobbled round the corner of the house. The horseman watched him disappear, then tried the door. It opened; he passed through, and closed it behind him. It had hardly shut when, with surprising agility, the beggar was at it, his ears open, his eye to the keyhole.

'Don Ignatio!' shouted the man who had just entered.

A muffled voice from the back of the house replied, 'Coming. Who calls?' Then silence, to be broken soon by footsteps. Suddenly the voice burst out hoarsely, 'Mother of Heaven, you?'

The man at the door replied slowly and quietly, 'Yes, I have come, *señor*; late perhaps, but I have come.'

And the other voice broke in, 'But what would you with me, *señor*?' and he stopped with a gasp, as if he had just caught sight of something, some horrid thing that he feared. 'Not that, *señor*,' he rushed on; 'not that! You forget I was not to blame. She loved me, and— Besides, *señor*, I knew not till afterwards that she was your daughter.'

There was a pause; then the man at the door took up the tale. 'Truly,' he said, 'you did not know she was my daughter then; but you knew she must be some one's child. You should have counted the cost then, *señor*, not now, seeing that now it is too late.'

Ignatio gave another gasp. 'But you, *señor*,' he muttered—'you will have costs to pay. Have a care, *señor*; they will be heavy.' Then, as if gaining courage, he went on with his pitiful excuses. He pleaded drink; the inevitable Mexican plea—passion, love.

The man at the door breathed hard. 'Stop!' he cried. 'I have heard enough. I am the one that should do the talking; but what I would say you would not understand, my words would not reach your heart, so I have brought an interpreter with me. See if you understand him.' There was a hiss of breath drawn between clenched teeth, then silence, a tragic silence, ended by the shivering crash of a revolver. As the echoes died away there was a dull thud. Ignatio Galvan was a heavy man.

With a skip and a jump the beggar was behind an angle of the house, and the door opened. Out came the horseman and glanced up the street. Not a soul stirred. The sound of a shot in Mexico never attracts attention; it is a land of grown-up children, where fireworks are cheap, and where they let them off at all hours and on all days. Don Ignatio had found a rocket in his house, and had fired it in the *patio*; that was all.

The horseman jerked open his revolver and replaced the spent cartridge, then walked to his horse. His eyes no longer gleamed; they looked tired, and he passed his hand over his face, smudging the dust and sweat. He swung into the saddle, and rode out of town. Soon he was a speck out there in the desert among the alkali and the cactus-bushes.

The beggar watched him, then turned toward town and proceeded to report to the first policeman he met. That worthy, in blue linen uniform and with sandalled feet, became suddenly very important; and as the Mexican law insists that all those who are able to give information with regard to a crime should be locked up, kept apart, and fed by the Government until the trial, he arrested the beggar.

This was exactly what the beggar wanted, as he had much rather the State kept him than be obliged to keep himself.

Again the sun shone—it is generally shining in Mexico—down upon a beautiful *plaza* in the small town of Uruapan, in Michoacan. It had rained in the night, and everything was fresh and green. The colonnades were full of merry, happy men and women busy about their various walks of life. In Mexico after a downpour every one seems energetic; but as the sun's rays grow stronger they begin to lazy. However, at

this moment every one seemed on the rush, with the exception of one man, who sat, content to watch, in the *plaza*. This man was English—English from the crown of his well-groomed fair head to the soles of his well-built polo boots. He smoked, watched, and enjoyed the jolly, fresh, bustling scene before him.

Across the *plaza* a picturesque figure came toward him—tall and venerable, long white beard, black alpaca coat, white trousers, all denoting respectability—a man of parts. The Englishman, Billy Harding, jumped up and took off his hat. This Mexican coming toward him was one of those men who command respect. Also, he was the *jefe politico* of the town. Now, a *jefe politico* in Mexico is a big personage in his own jurisdiction; he is the political chief or head magistrate of the district, he is hand in glove with the commandant of the small garrison, and in fact is a law unto himself. Because of all this, Billy took his hat off; also Billy liked and respected the man. He had heard great stories of him, pointing to the fact that during the French war he had been a great fighter. And Billy so far forgot his insularity as to bow. He admired great fighters.

'Ah, Don Fernando,' said Billy, 'I am glad to see you!'

The Mexican sat down and accepted one of the proffered cigarettes.

'That, my young friend,' the *jefe* smiled, 'is good hearing. But why are you glad to see me?'

Billy laughed. 'For two reasons,' he answered: 'one because I always like talking to you; the other because I want to use you for my own ends.'

A Mexican likes candour, because he himself is so seldom candid. Don Fernando laughed, and lapsed into English. 'You son of a gun!' he chuckled. 'All ri'. What you want?'

This sounded rather frivolous from a man of his years, but it happened to be all the English the *jefe* knew. Billy threw back his head and indulged in a hearty laugh. Now, when Billy laughed he endeared himself to every one; his jolly blue eyes twinkled, his white teeth gleamed, and his fair moustache fairly bristled with delight.

The *jefe* caught the laugh, and joyously smacked Billy on the back. 'Ask what you will,' he said in his own tongue, 'and it is yours, *señor*; everything that is mine is yours.' Then, as an afterthought, he added, 'With the exception of my gray mare and my wife. They are both old, but both are inseparable from me.'

'Well,' said Billy, 'I don't want much; only you to recommend me a *mozo*. You see, they are so hard to find—good ones. Some are excellent guides, and don't understand horses; others the reverse. But what I complain of is that they talk. As you know, I have to cover a lot of ground in order to buy cattle, and I have to carry money. It's no fun if you can't

trust your guide and servant, when you feel that he may be telling all the *ladrones* in the country that you carry money, and one day get you held up and robbed. It does not help you to sleep, that sort of thing, *Señor Jefe*. And when I am in the mountains I love sleep.'

The *jefe* stroked his beard. 'Oh,' he said, 'they are hard to find, I know. What you should do, *Señor Harding*, is to place one of these men under a deep obligation to you. Render him some great service, and he would not forget; his honesty—to you—would be unimpeachable.'

'Easier said than done,' murmured Billy.

'It is quite easy,' went on the *jefe*. 'Now, at this moment I have in the jail an excellent man, excellent in every way. I propose that you should stand *confianza* for him. You will understand better when I say bail him out.'

'What is he in for?' asked Billy.

'Murder,' casually announced the *jefe*, with a wave of his aristocratic hand.

Billy sat up with a jerk. 'Thank you, *jefe*,' he said; 'I don't think I'm taking any.'

The *jefe* looked grieved. 'But, *señor*,' he went on, leaning forward, 'there were extenuating circumstances. Oh, they quite exonerated him—the circumstances. He shot the man more in justice than anger. It happened in a northern town. He called on the victim, one Ignatio Galvan by name, taxed him with'—Here the *jefe* looked round, saw two ladies passing behind him, and whispered to Billy, then leant back with palms outstretched. 'And so, *señor*, he naturally shot him, all in the light of the noonday heat.'

'Well,' said Billy, much relieved, 'he did the right thing; but why on earth send him to jail?'

'There,' said the *jefe*, 'you strike the point. You see, it is not quite for murder that he is in; it is because he borrowed a horse to ride north to administer his righteous punishment; or, rather, he forgot to borrow the horse—he just took it. Had the owner known at the time to what estimable use his horse was to be put, undoubtedly he would have lent it. But he did not know, and was very irate; so that when this man—his name is Pedro Olvero—came back to return the horse quietly, he was met by a military escort to arrest him. Whereupon he grew very angry, and fought the escort, and wounded several before they overcame him. So the court took a serious view of the whole matter, and sentenced him to twelve years.'

'Poor devil!' said Billy in English, for Billy loved fighters.

'Of course,' continued the *jefe*, 'he is a bit wild, untamed, and half Indian; but to any one who did him a service I know he would be faithful. As for the bail, I can arrange that—merely a matter of a few hundred dollars. Now I will take you to him.'

So saying, he and Billy rose and walked across the *plaza* to the *comiseria*, or courthouse and

prison combined. They made their way through a throng of women—the wives and sisters of prisoners—who stood about with basins of beans and *chili con carne*, patiently waiting to get one of the guards to convey these delicacies to their respective menfolk.

The *jefe* reached his room, gave an order, and without delay the prisoner stood before them. In Mexico things can be done without delay when the order comes from the right quarter—that is to say, the strongest.

Pedro Olvero stood sulkily in front of the *jefe*. He had had about enough questioning and badgering to last him a long while, and he took no pains to hide his displeasure. He was a fine specimen of Mexican Indian, slim but athletic, with jet-black hair and dark eyes that looked sometimes fierce and then wistful. As his eyes wandered round the room they encountered Billy's. At once they began to twinkle, for Billy grinned and nodded in a most friendly way. Pedro lately had lost sight of friendly looks, and with something of sorrow his eyes dropped.

'*Ingles!*' he murmured. 'Perhaps he understands.'

Then the *jefe* suddenly became very business-like and severe. He told Pedro many things, amongst them that he would probably die in prison; that in any case he deserved to die; that he was a 'bravo,' a 'bad man,' a 'man without shame;' but that he—the *jefe*—believed there was some good in him. He had spoken to the English *señor*, who possessed the kindest of hearts, and had voluntarily offered to stand *confianza* for him, provided that he—Pedro—would work honestly for the said English *señor*.

Pedro at the end could say nothing; his big eyes were full of tears.

Billy looked at him and grinned again. 'I like this fellow!' he thought. 'Why, he's a great kid, and I'll bet he's full of beans once he gets away from here.'

Then Billy explained that he bought cattle for the packing company that owned the plant down the river, and wanted him as his *mozo* or guide; and told him that he, when released, must find his way there, and start on his duties at once. Then, to show that he already trusted him, he gave him a five-dollar bill.

'For clothes,' he said. 'Those are dirty, and I like my men to look smart.'

Then Pedro was led away, and Billy went through many formalities. When he had signed innumerable papers and paid over five hundred dollars, he said, 'Look here, *jefe*, if your murderer takes it into his head to bolt, it seems to me that I stand to lose my money, and perhaps be executed.'

'That's so,' amicably smiled the old gentleman; 'but you are safe; in fact, you will find the greatest difficulty in ever getting rid of Pedro, for Pedro likes you.'

'NOT CRICKET.'

By EUSTACE MILES.

THE man who coined or set in circulation the phrase 'not cricket' deserves the thanks of a sports-loving people. We do not know who he was, nor can we find out; but he was a benefactor of the race and a moral genius, showing a happy gift of driving a lesson home by a vivid illustration taken from the favourite summer recreation of the people. He was the forerunner and the founder of the new and more sympathetic and less academic school of English moralists. For generations past his predecessors had been telling us that our code of honour in business was very lax. It allowed us to do many things that we ought not to have done, and to leave undone an even greater number of things that we ought to have done, as well-disposed men. And the same applies to politics also.

With all his regard for our true welfare, the moralist of the old school failed to alter the state of affairs. For one thing, he was too fond of the wrong kind of preaching—the monologue sermon, for which, at heart, the healthy Englishman has a strong dislike—and he was decidedly dull and tedious and narrow and puritanical. He was not, as a rule, pleasant to look at; he was objectionable in manner; he was unsympathetic in voice; he spoke as from a higher and superior plane, which really on the part of such a man was a very serious offence. Further than this, he deliberately used words which were hopelessly stilted and out of date, instead of making his message clear (as the great teachers of the past have done) by illustrating his meaning from the daily life and interests of the hearers or readers. He could not well have chosen a vocabulary less suited to his purpose; and when he did choose illustrations, they were mostly taken from what the present generation would find either uninteresting or unmeaning.

One can say of him that he knew his moral text-book by heart, and that once his illustrations may have had some meaning. The world since then, however, has changed, and the moralist has failed to adapt his language to the needs of the times. The moralist has failed to extract the spirit of the old teaching and put it into modern language. What was needed was a series of vital and helpful illustrations, drawn from the everyday pursuits and pastimes of the people. This calls for a rare insight and sympathy with the people themselves. It demands a close study of the life and interests of the people. Of this need the moralist was quite unaware. He kept to his old dull phrases, while the world moved on.

No wonder, then, that he failed to influence us for our good, or to show us what was wrong with the sharp 'business' practices, that were oftener due to mere thoughtlessness and the blind force

of custom than to malice and cunning. Then, when he had failed so ignominiously, there came upon us this other unknown seer, arresting our attention at once, and convincing us with the skill and subtlety of a past-master of the art of teaching. With his long, thin, delicate rapier he pierces the vulnerable point in a man's moral armour.

'That deal which you have settled so smartly just now was "not cricket."'

'Not cricket!' the man gasped. 'Of course it was not cricket; we never said it was. That particular transaction was business pure and simple; we do not confuse our play and our work.'

'It is a thousand pities you don't,' replied the new censor of morals, with a pleasant smile, 'for your business would be infinitely cleaner and more honest if you would only set yourself to it in the same spirit in which you try to keep up your end at cricket.'

And with this our new and sporting moralist turned on his heel and left the person. He did not stay to rub the lesson in, or to irritate him by insisting that immediately he should run his business on hard-and-fast lines, according to the new kind of morality. He was content to let the living kernel of his teaching find for itself some suitable soil in the heart, and there take root, come up and flower, and bear fruit in due season. He spoke tersely, good-humouredly, and then passed on, so modestly that we were not even inquisitive enough to ask who he was. He has now passed on beyond us; he belongs to that unrecognised army of 'third-floor backs' who step out occasionally and bring a new rough gladness among men. All that we know of him is that, like a far greater One than himself, he came to us with 'publicans and sinners,' and that he had none of the puritan's coldness of heart and hardness of speech. He played with people, and he talked and laughed with them, and as he left he flung the new conscience-haunting phrase back at us over his shoulder. Yet, ever since the day when he went through the market-place, increasing numbers of people have tried honestly to bring their work into closer organic relation with their play, and to put the play-spirit into their work. They have realised, as never before, that one of the best services games can render us is to bring a welcome freshness of moral outlook upon the world.

It would be absurd to pretend that we have already mastered the lesson; but the new spirit has taken root already; not because it was brought as a denunciation, but because it was put to us as an interesting and appealing comparison. There is no doubt that in our vocabulary of sport we

have a splendid method of attack on a low standard of morality in business and politics and elsewhere. There is an open-air ring about such phrases that lets the sunlight and wind in upon our petty indoor higgling and scheming. They are to a sports-loving people the equivalent of the old-time parable which struck vividly home to the hearts of men when they understood the full meaning of it. One cannot hear the phrase ‘not cricket’ without feeling that it creates a new and higher scale of virtues. Sometimes, when all the circumstances of a possible ‘deal’ have worked insidiously towards a very smart or ‘cute’ *coup*, the man who is being hard pressed in the bargaining will appeal to the other’s sense of fair-play, and tell him that the thing is ‘not cricket.’ Then, as the words leave his lips, the walls of the narrow, stuffy office fall away, and there is before the eye of the bargain-driver a new vista—the

fresh green turf of an early English summer, the bright sunshine of June, and the happy and healthy movements of the white-flannelled players as they move about the wickets. Here, at least, is a world where sordid meanness and excessive ‘smartness’ have never yet found a permanent footing. A man who has come out on top in his deal knows exactly the code of honour which obtains in this manlier world of open-air comradeship, and the play-spirit in him instinctively rises and challenges the business Adam to a struggle that knows no quarter. For in the play code (as in religion itself) justice is invariably tempered with mercy; and when the play-spirit in any man who acknowledges the code and tries to live by it grips the old business Adam by the throat, the grip invariably means sure and speedy death to the ‘deal’ that is ‘not cricket.’

THE BRIGHT EYES OF DANGER.

By JOHN FOSTER, Author of *On Old Speyside*, *The Bernardine*, *The Ship of Shadows*, &c.

CHAPTER VI.—ENTER THE CHEVALIER.

I CAME back to the ‘White Horse’ and had an hour’s sleep, for the morning’s doings left me with little desire for rest. The landlord gave me the news that the main body of the Pretender’s army had advanced on the city by a circuit towards the south, to keep out of range of the Castle, which was still alive with guns and flying King George’s flag. I was standing on the fore-stairs watching the passers-by, when I chanced to see Walter Irving on the opposite side of the street. He was deep in conversation with two Highland officers, one a captain, the other a subaltern. Walter was doing most of the talking, the officers listening intently, the three heads all close together. I think I must have stared too fixedly at them, for one of them looked up, and saw me looking. I recognised him at once. He was Alasdair Stuart, he who was in command of the ambush we fell into on our journey to Edinburgh. He laid a hand on Walter’s arm, and said something; whereupon Walter wheeled sharply round, and signalled to me to come down.

I crossed the causeway.

‘The last meeting between us three was scarcely so pleasant as this,’ said Captain Stuart; ‘but my duty in the service of his Highness forced me to certain formalities.’

‘This is Mr Edmund Layton of Westmorland,’ said Walter, presenting me first to Stuart and then to the subaltern, whose name I did not catch.

I bowed, and Walter went on with, ‘We are both non-combatants here in Edinburgh on our own business, as you, sir’—addressing Stuart—

‘are aware. His Highness’ (he dropped the designation ‘Pretender’ in presence of the Jacobites)—‘his Highness has as much of our hearts as Hanover.’

This was an over-statement, and I did not warm to it. Politeness has its limits.

‘No,’ said I distinctly; ‘so far as I am concerned, it is true that as yet I carry no sword for King George; but a Layton never mounted the White Cockade.’

‘I meant no more than that, Mr Layton,’ said Irving hurriedly.

‘No doubt. It is well to be precise in these matters,’ Stuart interposed. ‘But I may tell you, gentlemen, that the heralds of Scotland, by his Highness’s commands, will proclaim his Royal father, James, King of the Realms at the Cross this day. We shall see more White Cockades than Mr Layton dreams of.’

This speech was given stiffly enough, with a certain air of detachment, derived perhaps from his precedence in years and rank to us; but it was addressed directly to me, and I felt under no obligation to feel or appear impressed.

‘The fault is mine if I did not make myself clear,’ I made answer. ‘I said that I carry no sword for King George.’

‘I think, young sir, you said “as yet.” Is this so?’ asked he.

‘It is.’

‘And by that you mean?’

‘What I say. You are a Highland officer and a gentleman. I am an Englishman of equal condition. I claim the right, so long as I bear arms neither for Stuart nor for Hanover, to go my own way. What I refuse to do is to “jump

with the cat," or pretend in the smallest degree to have Jacobite leanings. From all accounts the Young Chevalier would be the last man to cavil at this.'

'He is marching to the throne,' said Stuart, his eye gleaming, his voice rising. 'I tell you, from what I know, that the Borders and the North of England in a month will be ablaze with loyalty, or rebellion, as the Whigs insolently put it. "The Fifteen" was woefully mishandled; but to-day we are in better heart, better led, and King Lewie's purse and his men, under Lord John Drummond, when the time comes, shall be all for the Chevalier and the Restoration of his Most Christian Majesty, God bless him!'

He bared his head, his voice vibrant. I could not but admire and respect his manifest devotion.

I made as courteous reply as I could; for, rebel or no rebel, here was a man. Had all the Pretender's officers been of his calibre strange things might have happened.

Up then comes an officer on horseback with a message. The Jacobites, with a curt enough salute, went their way, and Walter and I were left alone. He did not look in the best of humours, and his first words were querulous and constrained.

'There surely was no need for openly disowning the White Cockade,' said he, frowning.

'I like plain speaking,' I said, 'and I call to mind that you yourself vowed—I remember the very words—that you would never "lift a finger one way or the other." Nor do I intend to.'

He shrugged his shoulders. 'I met the captain and his friend by accident, and passed a ceevil word or two wi' them. What could a body do? Maybe I was a bit owre—owre'—

'Over pleasant, Walter, and over anxious to get news, and over anxious to please, and in the process to say the thing the Jacobites wanted to hear. You meant no harm, I make no doubt.'

He looked hard at me, and I thought for a moment that I had said too much, but his brow cleared.

'I dare say you're right. The truth o't is that I scarce can help myself. New faces and affairs tak' hold of me like a sang. 'Tis a bairn's trick, I grant ye. I like yon Stuart,' he added meditatively.

'So do I. A good blade, keen and straight.'

'Yes,' said Walter, 'as ye say, keen and straight. But I think the man's fell wrang about the Borders and the North of England. I ken the Borders, and I'm greatly mistaken if the Pretender can rouse them. As for the North of England, ye'll ken more than I do. What think ye?'

I only knew Westmorland and Cumberland, and told him what I knew of the Pretender's

chances there, which depended, I thought, upon the strength of the Royalist garrisons at such places as Carlisle or Kendal; that the countryside in general was loyal to King George, although some great families were still suspected of being in secret communication with the Pretender's agents and the French Court. Not that these things were openly spoken of, for after Derwent-water went to the scaffold for his share in 'The Fifteen' the men of Cumberland and Westmorland were chary of speech, keeping their thoughts to themselves. 'To the King over the Water' was only drunk behind closed shutters and among known friends.

The crowd on the street thickened, all flocking in the one direction towards the King's Park, for Charles Edward was advancing in person to the Palace of Holyrood, and every one was on tiptoe of excitement. My companion and I joined the throng, that had now grown to a mighty press of people filling the Park and the gardens below. Walter and I fared well enough, for by good luck we were wedged amidst a company of folk of the better class on the Stuart side, so that we were nearly in the front of the crowd.

I saw the Young Chevalier four times in my life. On three of these I had speech with him, and my first thoughts of him are my last. He looked a Prince. I read chivalry and generosity in his face and bearing, and I was soon to discover that I had read aright. Fair-haired, eyes large and brown, with a body fitted for field as for Court. I remember that he wore the Star of Saint Andrew, with a blue-and-gold sash over his shoulder, and a white satin cockade in his velvet headgear. He was finely mounted on a beautiful bay. I never saw a more romantic and inspiring figure. It must have been a glorious hour for the disinherited exile, this approach to the ancient palace of his royal forebears, all around him a cheering multitude. Still, I thought (and on each occasion that I saw him afterwards the same thought forced itself on me) that behind his gracious smile there was a certain melancholy, abiding and predestinate.

Little wonder that he gained hearts in Edinburgh. His handsome looks, the high courage of his enterprise, the romance of it all, stirred men's minds. Indeed, had I not been a Layton, I almost believe that I might have mounted the White Cockade there and then, for in common with many others my preconceived ideas of him had been woefully at fault. I scarce know why; but I had drawn a foolish portrait of him for myself, swayed in part by my family's loyalty to Hanover, and in part by the stories of the rank and file of the wild Highlanders who followed the Stuart fortunes.

I have seen some pageants since, greater pomp and circumstance, a great leader returning from victory, kings and potentates receiving homage; but I saw that day what I have never seen since

—gentlemen, as well as men and women of the people, pressing forward with tears of joy to kiss the very boot of the Chevalier.

When he went into Holyrood House a movement towards the city set in. I asked the cause, and found that the heralds and pursuivants of Scotland had been taken in the morning, and that the Pretender's friends were about to use their ancient offices in a public proclamation of King James. Following the stream of the crowd, we came to the Cross of Edinburgh, where there was a detachment of the Highland army. There a Jacobite teacher proclaimed the Pretender's father King James, and read a commission in favour of Charles as Prince Regent. There was cheering from the mob; but I observed that few persons of condition were to be seen, except those of the more impressionable sex. Many ladies looked down from the high windows in the High Street, wearing white roses and waving their handkerchiefs. The pipes played wild and inspiring tunes, and the Highland guard fired their pieces in *feux de joie*; but a great many of the people looked on at the disloyal ceremony in silence. Perhaps it might have been otherwise had the Prince been present; but both Walter Irving and I remarked on it.

'Why are ye no' shoutin' wi' the lave?' Walter asked a stolid-looking burgess next him. The man cocked a stealthy eye at him.

'Imph!' said he; 'maybe I'm waiting, like a lot o' my betters, for the cat to loup. 'Gin the gentry are owre lazy to raise the tune, it's no' for the likes o' me to tak' their place.'

'The man's right,' said Walter as we went towards the 'White Horse.' 'Were I carryin' a claymore for the Pretender I would say that there are no' enough of the gentry showin' face for my taste.'

This was true. Further, differences, wide as between foreigners, lay between the parties—differences of mind, temperament, outlook. The canny Scottish burgesses could not understand the steel links between the clansmen and their chiefs. To them the rank and file of the Chevalier's army seemed little removed from predatory men of the wilds. But between the Jacobite leaders and their followers in the North

there was an intimate personal bond. No shop-keeping or commercial interest swayed them. The chiefs were martial leaders, fathers of their clan, welded by the traditions of years, by personal service, by blood bonds; for true it is that romance lives longer among the hills and the great open country than in the marts and thronging streets of towns, where money-making, cold-eyed and cautious, lays a hand on the reins of men's impulses.

Next morning, as the day was one of clear sunshine, I bethought me of an hour or two in the saddle. I ought to have paid my visit to Mr Scott the lawyer; but I was in no great hurry, and had no day set to meet him. Early in the forenoon I met Irving in the *portecochère* of the inn. He was very quiet, and a hint of dejection shadowed his face.

'Art thinking of the lass, Walter?' I asked him.

'I'll no' seek to deny it,' he answered. 'Deed, it's nothing I have seen of her since I drew bridle in Edinburgh, and since I lost the horse it's little chance I have of settin' eyes on her.'

I laughed a heart-free laugh, and tried to rally him.

'A gallop in the country will fit you better than mooning about the Duke's Walk on the chance of seeing her. Come, I'll hire a horse for you!'

But if he was in a tender mood, he was also in a mulish one, and shook his head. We stood at cross-purposes for a minute. I could see that it made vastly little difference to him, so long as he went the gate he wanted to, whether I came with him or not; but to settle it I out with a guinea and spun it high in the air, with 'Shield, you go your own way! Head, you come with me!' The coin clinked on the flagstone. It fell, shield-side uppermost. Never did the spin of a coin mean so much to me.

'So! Good-luck to you! I ride alone this morning;' and I went to order the saddling of my horse not in the best of tempers with him, but sorry for his black mood. When I rode out I saw his broad back moving slowly down the street.

(Continued on page 83.)

BELGIUM AS I SAW IT.

By the Viscount SANTA THYRSO.

THE invasion of Belgium by Germany looks to me like a ruffian ruthlessly trampling on an anthill for no other reason than that it happened to be in his path. The galleries laboriously built by the industrious insects are ruined, the stores accumulated by the whole summer's work are destroyed, and the ruffian goes on his way heedless of the misery that he has caused by his selfish progress.

Little Belgium was indeed a big art museum. Every one of its historical cities was remarkable for its monuments, most of them for their pictures: Brussels, with its Grand' Place, which is absolutely unique, its Porte de Hal, and its remarkable churches, such as St Gudule and Notre Dame du Sablon; Liège, astride the Meuse, with its Church of St Jacques, a magnificent specimen of the flamboyant style, and its Palais

de Justice; Ypres, with its Halles; Louvain, with its Hôtel de Ville and its Church of St Pierre, to say nothing of its rich library wantonly burnt by the invaders; Antwerp, with its cathedral with seven naves; Maestricht, that boasted of possessing the oldest church in the Low Countries; dreamy Bruges, with its Memlings, its sleeping canals, its Béguinage on the Minnewater, and its Godshuis (God's Houses), where little old women make wonderful lace; Ghent, where Charles the Fifth, German Emperor, was born, with its Church of St Bavon, containing the 'Adoration of the Mystic Lamb,' the masterpiece of the Van Eycks, and the melancholy impressive ruins of the Château des Comtes; and charming Hal, Tournai, Courtrai, Oudenarde, and others, each having the pride of a wonderful cathedral or a famous Hôtel de Ville, and the best paintings of the Flemish school, their history written in marble and on canvas.

These Belgians—the little ants trodden under the hoofs of the German cavalry—are a hard-working, sober-minded, peaceful people who have never asked anything but to be left alone. But they are a proud people. Their neutrality was a right, rather than duty, since it was guaranteed by the Powers. Were they an emasculated people they would have protested against the violation of their right by one of its guarantors, and trusted the others to do their duty by them. But as they have ever been scrupulous in the performance of their duties, they manfully decided to uphold their rights even against overwhelming odds; and so they did to the utmost of their capability. They went down under numbers. Yet until they have recovered from the blow they can proudly say, like the French king, '*Tout est perdu fors l'honneur.*'

Their intimate life is quaint, and unlike that of any other people that I know. The new country, born in 1830, still preserves the stamp of that period. It has its doctrinairism and its formalism; otherwise modern Belgium has absolutely all the prejudices of an old-fashioned Liberalism. What makes it more remarkable is that it is blended with touches of old Austrian formalism. It is a usual thing to address a Minister or a member of Parliament as '*Monsieur le Ministre*' or '*Monsieur le Représentant.*' Even the designation *Chambre des Représentants*, given to the lower chamber, is typical of the 1830 ideas. At the same time, there is not in the whole world a more democratic Court. The White House in Washington is less formal; but the Élysée in Paris is much more like a Court than the Royal Palace in Brussels, and a public audience by the Mexican President—at least under Porfirio Diaz—a much more sumptuous affair.

The much-abused King Leopold owed not a little of his evil reputation to his democratic ways. Yet, though he compromised with the ideas and the feelings of his people, he was made

of the stuff of a real commanding sovereign. His colonial plans were at one time represented as a private financial speculation. His accusers had forgotten—perhaps they did not know—that a short time after taking his seat in the Senate as Duke of Brabant, many years before he ascended the throne, he delivered a speech urging the necessity of expanding over the seas the limited territory of Belgium. Like all great minds, he was far in advance of his contemporaries, and his words were considered the vagaries of a young, inexperienced prince. When he became king his ripper experience showed him that the Belgian people, who are extremely conservative, could not understand him, and he started alone, as a private individual, the overwhelming task of creating a colonial empire for Belgium. He built the Congo Free State. How impatient he sometimes was of parliamentary talk is shown by his letter to the Congo Secretaries of State in 1907. Yet he scrupulously observed the Constitution, and his influence in Belgian politics was due to no breach of constitutional law, but to his masterful personality.

When, in the later years of his life, he wanted to cede to Belgium the big empire he had created, he met with formidable opposition. Some Conservative elements, from their conservatism, disliked a new departure in the policy of Belgium. The Liberals opposed it because it was a ministerial scheme, and they were the parliamentary Opposition. So did the Socialists, alleging that the annexation of the Congo was a capitalist measure. M. Vandervelde, one of the leaders of the Socialist party, and its foremost member, placed his patriotism above his socialism. M. Vandervelde belongs to the intellectual section of his party. He has the makings of a statesman, and Belgium has much to gain if he ever sees his way to find a compromise between his socialistic and radical opinions and the present state of society. He went to the Congo to see with his own eyes the work of King Leopold, and he came back reconciled to the idea of annexation.

When the struggle for the annexation of the Congo was at its crucial point, a double regicide was committed in Europe. Referring to it, the king said to me, '*Nous faisons de votre mieux pour le bien du pays, et on ne veut pas nous croire!*' and as he said this he struck the floor with his walking-stick. It was the only time I ever detected a suppressed emotion in his slow, nasal, often sarcastic utterance. But I shall never forget the pathetic figure of the old king who had accomplished the gigantic work of his life, realising in his old age the political idea of his youth, and who saw himself misunderstood by his people.

His people, however, came round in time. Leopold the Second was never loved by his subjects. But he was deeply admired, his prestige was enormous, and when he passed

away there was sincere grief for the loss of a great king.

The second marriage of his daughter Princess Stéphanie, the widow of Archduke Rudolf, was a blow to his royal pride, though Herr (now Count) Lonyayi is a very honourable gentleman of very good birth. It was, nevertheless, a *mésalliance*; and he could never get reconciled to the idea that his daughter, whom he expected to see wearing the imperial crown of Austria, had become a simple Austrian countess. It was his political mind that determined his opposition to the marriage of Princess Clémentine to Prince Napoleon, though he had always shown the highest regard for the prince. He shrank from the possibility of future complications with the neighbouring republic. The life-romance of the imperial couple only came to a happy consummation after the king's death. During his life, however, it was worth while seeing the father and the daughter side by side at Court or at public functions. They were indeed a royal couple—the old empire-maker and the beautiful, stately princess, a 'daughter of the gods,' both having in their mien the expression of an indomitable will. Neither of these two master-minds could yield to the other.

King Leopold was said to be ungrateful, and the saying was current that when a man ceased to be useful he threw him away like a pressed lemon. There was some truth in this. But the old king was a kind of superman, and his greatness was injurious to his amiability. He had no friends, and he required none. All he wanted was able servants. He showed no gratitude, and he expected none. Men were tools in his powerful hands. So long as the edge was keen and they were fit for the work he had in hand, he used them. If they became blunt, or the work required another kind of tool, he replaced them by others more adapted to the new scheme. In his great political mind there was no room for sentimental feelings.

When King Albert took the oath of his sovereign office there were some unpleasant incidents provoked by the Socialists and the partisans of universal suffrage. But these were soon over. The most rabid Socialists themselves realised that the king meant well, and was devoted to the public welfare. His domestic virtues at the same time endeared him to the middle class. The little, cheerful queen, however, was the more popular of the two. She greeted everybody with an honest, kindly smile, and she often went to the houses of the poor like a fairy. Her golden hair shone like a halo, and her sweet cheerfulness was like a sunbeam that enlightened their dark lives. The Queen of the Belgians is very artistic, as befits a scion of the House of Wittelsbach. She teaches her sons music. At the coronation she appeared with the two little princes beautifully dressed in white silk, with large lace collars, suggesting

the princes out of the illustrations of a fairy tale. Besides being an artist, she is a daring rider. Soon after her husband's accession she appointed a new lady-in-waiting, a young lady of a noble county family who could follow her in her morning gallops across country.

For some time past there had been a strong apprehension in Belgium about its neutrality in case of a European war. The fortified line along the Alsatian frontier, and perhaps some German indiscretions, had awakened in the Belgians the fear of a German invasion if a war broke out between its rival neighbours. The idea of *revanche* among the French, and their natural desire to recover their lost provinces, practically excluded the probability of a French invasion. The sympathies of the French-speaking part of the population have always been towards France; the Flemish-speaking Belgians, however, were inclined towards Germany, with whose people they have more affinities. Between these two opposite currents the king and his Government have always been strictly neutral; and if their precautions had particularly in view the German danger, it only came from the fact that violation of neutrality on the French side was most improbable.

It was to maintain Belgium's neutrality, and not to help any of the belligerents, that King Leopold first, and then King Albert, were so keen on the construction of the entrenched camp of Antwerp, and the adoption of universal service to replace the old conscription system. The former scheme met with much parliamentary opposition—to the old king's disgust—which, however, was finally overcome. As a matter of fact, that opposition was only due to party tactics, which gave way to real patriotism. The other scheme was also objected to from a party point of view, but the objection had a more solid foundation in public opinion.

I have remarked that one of the Belgian nation's shortcomings is its 1830 doctrinairism. Anything approaching, or suggesting, militarism has been held in horror as a danger to its liberties. They would have as many *gardes civiques* as you like, but no standing army, or as little of it as possible. This feeling permeated all classes of society. As a volunteer army on the British pattern is a very expensive thing, for the Government has to compete in the labour market, a compromise was adopted with conscription with the faculty of replacement. The immoral result of the system was that the army was exclusively recruited from among the poorer classes, the members of which could not pay for a *remplaçant*. This, of course, made military service unpopular, especially among the Flemish population mostly devoted to agriculture, whose sturdy peasant boys had to leave the plough at the age when they became most useful to their parents.

The Liberal party, mainly from party motives,

claimed universal service, which, they knew, would have a disastrous effect at the elections for the Catholic party, which has been in office for over five-and-twenty years, and is mainly supported by the Flemish. On the other hand, the Catholics, for the opposite reasons, shrank from passing a Bill in that sense. Most forward in his resistance to the new measure was Count Woeste, the most prominent leader of the Catholic party.

The climax of M. Woeste's opposition to universal service was a temporary split between the Old Catholics, led by him, and the young democratic wing of the party led by Baron de Broqueville and M. Carton de Wiart. Comte de Smet de Naeyer resigned, and Baron de Broqueville became Prime Minister. The two wings of the Catholic party came to a compromise, and the new military Bill was passed, by which one young man of each family would be obliged to serve in the army, and there would be no replacement. So the army became national, and its numbers were increased. That was the army that met the German Colossus at Liège, at Namur, and at Antwerp. It must be added that most men of the well-to-do classes, and more particularly of the nobility, who in time of war had availed themselves of the faculty of *remplacement*, volunteered as soon as the country was invaded, and are now serving as privates or non-commissioned officers.

One of the most interesting features of the Belgian people is the way in which the old nobility, brought up in the aristocratic traditions of Austrian and Dutch rule, adapted themselves to the new conditions.

The Belgian revolution was brought about by the French Revolutionists of 1830, who cunningly exploited the religious feelings of the Belgian Catholics against the unwise interference of the Dutch Government with the Belgian Church. The Liberal Walloons and the Catholic Flemish joined together, supported by the revolutionary anti-Catholic French party that had brought about the fall of the Bourbon dynasty, against Dutch rule. That is how, just when they severed themselves from their neighbours, they adopted the motto, *L'Union fait la Force*. The Belgians have no sense of humour.

Among the leaders of the popular movement, the foremost was Comte de Mérode, Marquis of Westerloo and Prince of Grimberghe and of Rubempré. It speaks in his favour that he refused the crown of Belgium that was offered him by his countrymen. Since then the Belgian nobles have always associated themselves with the political life of the country. The ultra-democratic constitution of Belgium grants them no privileges whatever. While other European countries adopted a hereditary chamber, in bad imitation of the British House of Lords, Belgium had from the beginning an elective Senate. Yet many a representative of the old noble families

has had, and now has, a seat in the Upper House. Though there are no entails or *majorats*, it is a rule with the aristocracy that the parents will leave as much of their property as by law they can freely dispose of to the eldest son, thus keeping, in fact, the law of primogeniture alive. Tradition, the comparative extension of their landed property, the prestige of an old name, and the secular ownership of the land give them a natural influence that they increase by their devotion to local matters.

I will just mention a regretted friend of mine, who died a couple of years ago, a typical Flemish nobleman of recent times. The late Comte de Hemricourt de Grunne was a sensible, straightforward man, a thorough Flamand in his appearance, in his character, and even in his French speech. He was a senator, and, moreover, he was the burgomaster of his town. Both his senatorship and his mayoralty he retained for many years, till the last day of his life. I had the privilege of being his guest in the country, and then I could see the hold he had on his neighbours and how he managed to retain it.

Every Sunday, from nine to eleven in the morning, Comte de Grunne was in his study receiving his neighbours, most of them farmers. They all came to him for advice in every crisis of their lives. If they wanted to buy a cow they consulted him. If they wanted to arrange a marriage for their sons they consulted him. The count had studied law, and if they had a dubious point of law they consulted him, 'Because,' they said, 'if we go to a lawyer he will ask us for five francs, and M. le Comte gives us good advice for nothing.' Some thirty years ago a local banker had failed and run away with their deposits. Since then, as M. le Comte had a safe, they brought him all their savings for safe custody. They were left there in a bag to which the count affixed the owner's name, without any receipt or any guarantee but M. le Comte's honour. The Flamand has a long memory, and he would rather trust M. le Comte's safe than any banker's books. Since the famous failure thirty years ago no banker has ever had a chance of transacting business in that town. When a farmer wanted a few hundred francs to buy a cow or a horse, or a few thousand francs to buy a piece of land, he called on M. le Comte on Sunday morning; and M. le Comte opened the safe and handed him his bag. The farmer took the money he required; then M. le Comte again sealed the bag and replaced it in the safe. Every case of distress in the district was brought before him, and he promptly relieved it. In this way the old nobleman, besides his political and municipal duties, devoted two hours every week to the private affairs of his neighbours. It is easily imagined how much true and wholesome power this gave him over the peasantry. His son is not yet a senator, but he succeeded his father as hereditary burgomaster of Tongres.

This is only a typical example of the adaptation of the Belgian aristocracy to the new conditions. The case is different, however, in large towns where the Liberal middle class and the Socialist working classes predominate, especially in the mining districts.

The word Liberal in politics has a different meaning according to the countries. In Belgium it is quite different from the liberal signification. As a matter of fact, all Belgium is liberal and democratic in politics. I have shown how the formerly privileged classes, in order to maintain their time-honoured influence, have to place themselves on the level of the middle and lower classes, courting their vote and assuming civic duties. The political struggle between the two non-Socialistic parties is only on this point, whether religious education or non-religious education should be encouraged. As there is practically only one religion in Belgium—namely, the Catholic religion—the question lies between Catholic or non-Catholic education. It happens that in Belgium, as in all Catholic countries, non-Catholic means anti-Catholic, and even anti-religious, which by some lexicographic perversion is made a synonym of Liberal. The Catholic party in Belgium is as liberal and as democratic as the Liberal party, and to it is due all the well-thought-out social legislation of Belgium. I am not prepared to say that the social reforms would have taken place without the spur of the Socialist endeavours; but the steed has nobly answered to the spur.

On the education question that divides Catholics and Liberals, the Socialists are of course on the side of the latter. The Socialist party in Belgium is, moreover, revolutionary and republican. Side by side with the intellectual and statesmanlike Emile Vandervelde, who compromises with the sartorial prejudices of his party, but not with its impractical and violent appeals, there are rabid demagogues like M. Demblon—whose translations of Shakespeare bear witness to his admiration for the great poet rather than to his poetical powers—and M. Destrée. This strong demagogic element precludes the Socialists in Belgium from being considered a Government party.

As the Socialists have gained ground the Liberals have naturally lost it. The upper classes and the peasantry are mostly, and remain, Catholics. The Liberal party is chiefly recruited among the middle classes and the liberal professions. The Socialists are some intellectuals and mainly the working classes.

Though there are very few people of the upper classes among the Liberals, and fewer, if any, among the Socialists, many middle-class people and men belonging to the liberal professions who have followed their studies at the Catholic University of Louvain belong to the Catholic party. On the other hand, the Socialist propaganda has already spread among the rural

population, especially on the French-speaking side.

The weakness of the Liberal party and the increasing strength of the Socialists account, to a great extent, for the long Catholic rule. The thriving, money-saving Belgian has a strong sense of property. It is known that if the Catholics left office the Liberals alone could not command a parliamentary majority. They would have to be allied to the Socialists. Now there is not one Liberal shopkeeper in Belgium who is not afraid of Socialism, and rather than have a Liberal-Socialist Government they vote for the Catholics.

The following story illustrates the point. There is in Belgium a citizen force called the Civic Guard. It is the only survivor of the several Gardes Nationales that originated in the Liberalism of 1830, and which caused so much trouble in their respective countries that they were suppressed after 1848, at the close of the revolutionary period. Even France did not renew the experiment. Belgium alone has remained faithful to the 1830 ideals. The Civic Guard is composed of all the citizens who pay a certain tax. Most of the men of the upper classes, in some mysterious—and I suppose not strictly legal—way, avoid the obligations. The working classes don't pay the minimum tax. As a result, the *personnel* of the Civic Guard is almost entirely confined to the middle classes—shopkeepers, clerks, and so on. Their duty is to preserve order in the town, though the Gardes Nationales in France and other countries wrongly supposed that it was to alter it, a mistake that led to their ultimate suppression. If there are riots the Civic Guard are called out.

The commandant of the Brussels Civic Guard once said to me, 'As long as the mob is satisfied with subversive cries, and that sort of thing, it is almost impossible to make the Civic Guard march against them. But woe to them if one of the rioters breaks a shop window. The Guards won't wait for orders to shoot, and not all the saints of Paradise could hold them back.' Which is saying a great deal in an intensely Catholic country.

Hard work and thrift are the secrets of Belgium's prosperity. When the Belgian Parliament was discussing the usual Eight Hours Bill, a commission was appointed to inquire into the matter. The commission summoned masters and workmen, and conscientiously listened to both sides. One workman said he wanted not an eight but a six hours day. Indignation spread in the commission, even to the most socialistic of its members. The chairman asked for an explanation; and the man explained, 'The point is this: if you give me a six hours day I can work for two masters, but with the eight hours day I am just where I was.' That does not mean that the Belgian workmen slave for a meagre salary. They make the most of their

money, and even save some of it. They have their Sunday and half a day on Saturday, the same as any respectable Briton; and they amuse themselves in their own way in their spare time, between their work.

Belgium has many more famous artists nowadays than we think. Many French *littérateurs* and artists are Belgians, just as Jean Jacques Rousseau was a Swiss. One of the best and prettiest French actresses is a Belgian. It is a drawback for Brussels that it is so near Paris, and that the language is the same. Paris offers a larger field to Belgian artists and writers, and if they become famous nobody inquires where they come from. Living in France, writing or acting in French, and often bearing a French name, they are for all purposes considered French. But it must be a fertile country that produces enough notabilities for internal use and for exportation.

One feature of Belgian political existence is the intensity of its municipal life. Every commune is to a great extent autonomous. What is commonly called Brussels, and is really called *Agglomération Bruzelloise* (Brussels Agglomeration), is a congregation of independent communes, each of them with its corporation and its burgo-master. Each commune has its own police force, the jurisdiction of which ends where the boundaries of the next commune begin. This circumstance occasionally has its inconveniences. A crime is perpetrated, say, in Brussels proper. The criminal is pursued by a policeman. He crosses a street, and he finds himself no longer in Brussels but in Schaerbeck. The policeman

cannot cross the street. To arrest the man in Schaerbeck a requisition is necessary from the authorities of one commune to those of the other, which involves several formalities. In the meantime the thief crosses another street and finds himself in Etterbeck. It takes a lifetime to exhaust all the communes of Belgium. When the thief is tired of the game he crosses over to France or Holland, and there he is immediately collared. At the time of the Brussels Exhibition in 1910 there was a fire at the Exhibition. Much was destroyed because before help could be sent there was a discussion by telephone to ascertain whether the grounds where the burning buildings stood belonged to the commune of Etterbeck or to that of St Josse-ten-Nood.

That, however, shows once more the intense vitality of the communal life. The Belgian burgher is to-day as proud of his citizenship as he was in feudal times. It is the custom in the middle class for the husband to add his wife's maiden name to his own. When I asked the reason, a respectable merchant explained, 'You can only do that if your wife belongs to a good bourgeoisie family.' This just pride in their class will ever stiffen their backs to any foreign domination.

Germany knows by this time how the Belgians can fight for their rights, as Holland has learnt how they can shake off foreign rule. They are industrious and peaceful; but they are made of the same hard stuff as those who defeated the Austrians at Turnhout and forced the Austrian garrison of Brussels to capitulate. They have said the first word in the present war, but they have not yet said the last.

SHARK!

By H. GERARD ELEY.

THE mate came blundering out of the companion, and, that his destiny might be fulfilled, stumbled over the kitten that was lying asleep, coiled up on the grating in front of the door. His next action was one that gave me my first knowledge of what sort of man he really was. For, though it was a dear little creature, that kitten, and we all loved it, he aimed a brutal kick at it, which it avoided; he then ran after it, picked it up, and, with a curse, threw it, kicking, overboard. Some of the sailors had been fishing that morning for sharks. A score of the horrid brutes were round the ship; and I needn't say any more. But the poor mother, that had been dozing peacefully under the shelter of the dodger, jumped up and ran up and down the poop distractedly, gazing out over the oily, swelling water, and mewing piteously.

'Here, sir, what did you do that for?' I cried, in horror, running to the side. 'You brute, to go and dump that poor little beast! What's

the sense of it, you swine? Just because it tripped you up, you go and'—— I broke off, overwhelmed at the thought of his callous, senseless cruelty.

'All right, Mr Bloomin' Second Mate,' he answered, bombastically striking an attitude. 'It's not *your* kitten, is it? No, it's the ship's, I reckon; and as long as I'm mate of this old hooker I'll dump any durned thing belonging to her I want to! Savvy that?'

'No, by God, you won't!' I burst out. 'I'll see to that myself; or if you do, I'll—I'll'—— And I stopped, wondering what threat of violence I *could* effectively make, seeing that I had a game leg, and he was all of eighteen stone, with a chest like a full staysail, and could have *eaten* me if he'd a mind to.

'Yes! You'll—you'll'—— he mimicked jeeringly. 'Carry on, sonny; don't be afraid to give it a name! I know what you'll do!' turning on me in a sudden spleenish outburst. 'You'll run around and throw your tongue about

like the old cat there, and you'll yap and you'll threaten, and you'll *do*—nothing! I know your sort—sailed with 'em many a time; a proper durned soldier, all lip-flap and bubble, and that's the lot! Guess you'd better join up with the old un.' He indicated with a grimy thumb the poor mewling brute. '*She*'ll do me in before ever you will, I reckon!'

So I went below, fuming and unheroic.

But later I was to remember his last words, and marvel at them, in that they were—though we neither of us knew it—a prophecy. For cats are uncanny beasts, as you shall hear.

We were becalmed at the time this took place, a real deep-sea calm. The sea was a great, glowing, lavender-coloured disc, and the ship rolled sluggishly on its thick and unwholesome-looking surface, with the sails slatting jarringly against the masts, and the brazen sun pouring molten on the decks.

I know this doesn't fit in with a landlubber's idea of a calm at sea. I've read some of your shore-going novelists' ideas on the subject, and know their falseness; though near land, mind you, or in narrow waters perhaps, their descriptions are true enough, with the 'sea like a mill-pond and the sun mirrored in it.' But you must remember that we were *at sea*—mid-ocean; away south of the south-east trades, waiting for our slant to the Cape, with the water charted at four thousand fathoms and more, and only the stately albatrosses to bear us company. And when it is there you get becalmed, believe a sailor when he tells you that the sea is *never* 'like a mill-pond.' It is never still. Though the surface is thick and scummy—'oily' they call it, and rightly—and though there is never a ripple to break its treacly rest, yet the great silent swells follow one another remorselessly from horizon to horizon. They come out of the mists one by one—did you know there is always a misty look on the sea then, vague and purplish?—the ship gives a tilt and a roll, with the blocks and sheets all a-rattle, and the sails coming *ss-lutt* against the masts, all together; then she rights herself, the canvas flaps again, the sheets tighten for one moment and then go slack, and the swell passes on and is lost in the dimness beyond.

That's how it was that morning. Only, now and again there *was* something to break the scum into a ripple. Sometimes there'd come a sort of flash showing green through the water, as something white and gray moved beneath the surface; or maybe a fin—black and sharp and cruel, with a backward slant to it—would slide silently into view, and sink again very softly. The men had been fishing that morning.

Well, I went below. And at luncheon, when the mate was on deck, the captain missed the kitten and asked for it; so I told him what had happened, and he nodded and turned away. You see, he had been fond of that kitten, had

the captain. Later on he told me the story of another deed done by the same man, only a more hideous one—the story of a rat that had been caught the voyage before, and brought up on deck squealing and pawing in its cage; and how he (the captain) had seen the man standing laughing over a bucket, into which he poured something from a bottle, and then threw in a lighted match; and how he (the captain) strolled up casually, wondering what was happening, to find the bucket half-full of water, with a film of spirit on top of it, and a poor tormented brute swimming madly in a veritable lake of fire. Ay, there are men like that!

So I left my lunch, sickened, and hobbled back to my chair on the poop. I had twisted my ankle a few days before, you see, and was on the sick-list for the time being, the captain taking my watch.

Sitting there under the dodger, where the temperature was only just preferable to the sweltering heat below, I set to looking around me, idle and undisturbed, since the mate had left the poop. I could hear him storming and cursing at one of the men for'ard, even from where I was.

The breeze had not yet come, and the sea was, as before, swelling and unruffled; but there were even more sharks round, I thought; or at least there seemed to be. Never had I seen so many together before. There were big ones and little ones, thick ones, lean ones, gray ones, mottled ones; but all alike in their silent, deadly watchfulness, with a fin sliding up here and another one there, and down by the main rigging one huge brute floating motionless, his grisly shape distorted through the water.

We sailors hate sharks. I imagined to myself what would happen if some one were to fall overboard just then; the horrid commotion there would be down there, with the fins all cutting the water together and converging to one spot; and then the tinge of red on the surface perhaps, and the ghastly stillness again. I thought of the helpless kitten, and how quickly it had disappeared, and I shuddered and looked away.

Glancing down to the main-deck, I saw a very odd thing happen.

Our lower rigging, of course, was fitted with wooden battens crossing the shrouds all the way up from the rail to the top; fifteen inches apart they always are, making a regular broad ladder. Well, I saw the black cat, the mother whose young one had been sacrificed by that savage a few hours before, suddenly make a leap from the bollards on to the pin-rail, and from there to the t'gall'nt rail, and then she began to climb steadily up the main rigging.

I have never seen a cat do that before. I don't know why; it should be easy enough for them, I suppose. But this one did it, and did it very deliberately, somehow—very purposefully, if you

know what I mean—as though she had thought the matter out, and was going up with a definite object in view. I watched her, wondering, as she got higher and higher, till at last she reached the foot of the futtock-shrouds. The yards were braced up, I should have told you, with the main-yard jammed hard against the for'ard swifter; and she went up the lee side, so that when she got there she just stepped on to the truss, and slowly, and very deliberately still, walked along it on to the yard; and there she sank down on all-fours in the bunt, close beside the sling, where she was hidden from my view on the poop.

I was looking up after her, rather amused, and wondering what had induced her to go and hide herself up there, when the mate came aft and stamped up on to the poop, swearing volubly.

'Now, just look up there, mister!' he said, pointing to the weather mainyard arm. 'Did you ever see such a job as that in all your life?'

'Job as what?' I replied, hoping he hadn't seen the cat.

'As that (something) ear-ring, of course!' he swore. 'Isn't there a *man* in your watch knows how to pass an ear-ring? That's some of their rotten work yesterday afternoon. Good job I noticed it when I did; saw it from for'ard a little time ago, and I hauled the man who did it out of his bunk and gave him the toe of my boot for his trouble, now I'm telling you!'

'Yes, it's bad work,' I growled, not feeling much inclined to be pleasant to him just yet. 'But then it's nothing to do with me, is it? I'm laid up; and since it's your watch on deck, and you're "mate of this old hooker," perhaps *you'd* better attend to it, even if my watch did do it!'

They *had* made a poor job of it, all the same. The ear-ring had been hauled out right enough when the sail was bent the day before, but no backing-turns had been taken, so that the tack-tackle had bowed the head down and made a distinct gap between the yard and the sail.

'What did I have bulwangers put up there for, d'you think?' he went on aggrievedly. 'Ornament? I'll make some of these soldiers we've got on board learn to make proper use of them before they smell channel again, you see if I don't!'

'Yes, quite so,' I answered, being laid up and not caring whether the mains'l came adrift or not. 'No doubt they'll learn *lots* they didn't know before this trip, with you to teach them!' I was thinking of the kitten and the rat.

'Yes, by God, they will!' he foamed, scenting the sarcasm in my tone, and misunderstanding it. 'Never you fret about that! If I have to take a belaying-pin to them I'll do it! And don't you begin to think you can teach me my

job either, blast you and your game leg! because you can't—you, nor any one else! As for the ear-ring'—glaring aloft again—'I'll go and make a job of that myself, just to show there's *one* officer who knows his work!'

'All right. I'll watch you and try to pick up a hint or two,' I rejoined with a sneering little laugh. And he cursed me again, and the next moment had left the poop and was climbing up the weather rigging with a marline-spike slung in its lanyard round his neck.

Having nothing better to do, I *did* watch him as he crawled laboriously along the foot-rope and out to the yardarm. That reached, he threw his leg over the brace pennant and sat down astride the yard outside the lift, digging his left toe against the leech of the sail and leaving the other leg dangling. The man was obviously a sailor, I admitted, whatever else he might be; and I watched him freeing the marline-spike from about his neck with both hands, until something caught my eye moving in the bunt of the yard.

It was the cat, that I had forgotten. She had risen to her feet, so that I could see her from the poop again, though she must have been hidden from his view behind the sling; and she stood there staring at him, still as a rock except for a slight twitching of the tail. I wondered if she knew who he was—she almost seemed to, from the way she stood looking; and every moment I expected to see her come sneaking down to deck again out of possible harm's way. But she never moved, and I hoped the mate wouldn't notice her on his way back, seeing the mood he was in.

For the moment his attention was too much taken up with what he was doing for him to notice anything or anybody. We had chain ear-rings on that ship—old-fashioned, clumsy things with a hemp tail to them about two fathoms long; and as the tack had been boarded right tight, and he had only slacked the tackle a couple of fathoms before going aloft, some of the turns were pretty well jammed between the ring and the yard. I heard him swearing up there as he tugged at them with both hands, and I smiled to myself, knowing that he was conscious of my eye upon him. After a moment or two of useless wrestling he made his marline-spike fast to the lift-bolt by its lanyard, and began to prise up the ring with the point of it, so that he could get the tail under it and pull the bight of the chain clear. He got it through, and gave one tremendous tug with all his strength. And it did come clear; it came with a run unexpectedly. He gave one wild kick as the chain tore with a rattle through the ring, with his feet against the sail in a desperate effort to recover his balance; and the next moment he was hanging a score of feet below the yard, turning round and round like a joint before the fire, and screaming for help.

I wonder the jerk, as he brought up, didn't tear his hands from their grip. But it didn't. He held on, for all his eighteen stone weight, while I shouted like a maniac for some of the hands to go up and help him, hobbling up and down and across the poop in a frenzy. For there was a good thirty-foot drop to the water, and I could picture the ghastly waiting shapes.

Two of the men were tearing up the rigging, but, oh, so slowly! I heard him cry out, in a voice I shall never forget, 'For God's sake, quick! I'm slipping; I can't hold on! Oh, be quick!' And he looked down, and screamed again.

And then there happened something very horrible. A lithe black form suddenly shot out from the bunt and ran along the yard; and there was the cat crouched, snarling, above him, with lips drawn back, writhing, showing the pink gums, and her tail swishing venomously from side to side! He saw her, and again he screamed horribly.

The men were on the foot-rope now, panting out little cries of encouragement to him. They would be above him in a moment, and haul him

up into safety. But the chain was beginning to slip ever so slightly through his fingers; bit by bit his grip was loosening; inch by inch he was sliding lower.

He had stopped screaming now. His head was back and his eyes staring upward. Then the cat sank to her haunches. I saw the muscles creep at her shoulder, and her tail go rigid and her ears back as she poised for the leap. And, just as the men reached her, she sprang!

The picture is photographed, in all its dreadful detail, for ever in my memory. They took so long, so terribly long, to fall—the man with arms outstretched, grasping at nothing, and his face hidden by the black fury that clung to it. I even had time to notice some little spots of blood spring crimson on to the whiteness of his shirt before there came the splash that hid everything. And at that splash two slanting fins suddenly appeared, cutting the water side by side, so that I shrieked aloud. There was a little gurgle, a little eddy that spun for a moment on the gummy surface and left a frothy stain behind it. Then that, too, disappeared; the swell rolled on, and the sea was still once more.

THE KAIETEUR FALL, GUIANA.

By F. NICOLLS.

PROBABLY most people, if asked which was the world's biggest waterfall, would answer Niagara, for it is the best known, having been the most often visited. Yet the Kaieteur Fall, which was discovered by Mr Barrington Brown, of the Geological Survey, on the 24th April 1870, is no less than five times as high as Niagara, having a clear drop of seven hundred and forty-one feet, after which it falls eighty-eight feet more over a sloping rock, making a total of eight hundred and twenty-nine feet, while the width varies from two to four hundred feet. This remarkable fall is situated on the Potaro River, two hundred miles from Georgetown, the capital of British Guiana. The name Kaieteur is from an Indian word, meaning the 'Old Man' Fall; it is attributed to the custom of the Indians of putting their relations, when they get too feeble and old to work, into a canoe and allowing them to drift down the river and over the fall—a painless and practical form of euthanasia!

A visit to Kaieteur is no longer the formidable undertaking it was a few years ago. Arrangements have been made by an enterprising firm for taking parties to the fall and back in nine days at a charge of sixty-five dollars each.

Mr Edward R. Dawson, who visited the fall some time ago, gives an interesting account of the trip in *The British West Indies* (Pitman), a valuable work which should do much to make

these old English colonies popular as winter resorts, and also to popularise them as fields for planters and the investment of capital in planting enterprises.

Mr Dawson's party left Georgetown in the early morning by the Demerara river-steamer, and through the day journeyed up-stream, first past sugar estates, with their tall chimneys and vast stretches of vivid green sugar-cane; then past cocoa and rubber estates, with bungalows amid the trees. All the way up were clearings here and there, where negroes and others had their dwellings on the bank, and grew provisions for the daily markets of Georgetown at the mouth of the river. At sunset they arrived at Wismar, the steamer terminus, where schooners were being loaded with the colony's greenheart logs, and where there is also a railway station, with all its attendant bustle. The railway took them along reefs of pure white sand, and through forests where wood-cutting was progressing, to Rockstone, which was reached in darkness. By the light of oil-lamps they took their belongings to the bungalow hotel, where they passed a comfortable night. Daybreak saw them out again and boarding the Essequibo river-launch. Once more they made their way, hour by hour, up a broad but shallow stream, steering from side to side to avoid sandbanks, now and again meeting boats filled with gold-workers or balata-bleeders on their homeward

route. Balata is closely allied to rubber. It is a gutta-percha-like substance which is 'bled' from the bullet-tree (*Mimusops globosa*) found growing in the forests all over the colony. The tree takes a prodigiously long time to reach maturity, and consequently no attempt has yet been made to cultivate it in plantations. But that its advantages have been appreciated will be seen from the fact that while only twenty thousand pounds of balata were exported in 1865, one million thirty-four thousand and seventy-six pounds, valued at four hundred and sixty-eight thousand and thirty-four dollars, were sent from British Guiana to Europe last year.

As night fell the party reached Tumatumari, the gold town, where they put up at the quarters of a hospitable gold official. At early morn they visited the Tumatumari Falls, and then left by steam-launch, the vessel starting from above the rapids. A few hours brought them to Potaro Landing, where civilised travelling ceases, and they had to begin bush life. They took the trail through the forest, and camped at the Pakatuk Rapids. Here the organiser of the trip had a boat with a mixed black and Indian crew, paddles in hand, awaiting them. From that time the journey daily increased in interest. Forest-clad hills grew closer, and every reach of the river discovered fresh beauties of tropical life. Each day's routine was much the same—an early start before the rising sun had dispersed the mist, constant paddling mile by mile up-stream, varied by the boatmen having to pull and haul the boat over rapids, or lift it bodily over barriers of rocks.

In four days they came to the Takuit Falls, where they left the boat and started their climb up the hill to the Kaieteur tableland. The Indian path was steep and long, and the forest air hot and heavy, so they felt glad when they emerged on to the rocky tableland. A short walk to its edge, and the Kaieteur Fall burst upon them in all its grandeur. From the highlands in the distance one could see the river rolling past forest and plain till it reached the edge of the tableland, and, hurling itself over, go thundering down into the mist below. Mere words cannot adequately describe it. The wind-eddies blow the spray-mist here and there, and up and down, and the sun's rays catch the vapour-cloud and throw across now one, now two, quivering rainbows. Flights of white-throated swallows continuously sweep over the face of the fall, and, shooting down with incredible velocity, twist in and out of the gloomy cavern behind. Night and day there booms in one's ears the deep organ-note of the fall. All around is the solitude of nature, broken only by the passing of Indians on their hunting-trips, or the very occasional visitor.

In Koraima Mountain British Guiana has another scenic treasure offering wildly fantastic landscapes and views of rocks in positions which

seem to defy the laws of gravity, and of every conceivable form. There are some like terraces, columns, walls, and pyramids; whilst others appear like caricatures of umbrellas, tortoises, churches, cannons, and other innumerable incongruous and unexpected objects.

King George the Fifth had paid the West Indies three visits before he came to the throne; and probably every future Prince of Wales will make a tour through these beautiful islands, where, it may be said, the foundations of the British Empire were laid. Memories of the great Elizabethan seamen, Raleigh, Hawkins, and Drake, and of later heroes, Benbow, Rodney, Hood, and Nelson, should endear them to all Britons. At present, so far as visitors are concerned, they seem to be more popular with Americans than with Englishmen. The opening of the Panamá Canal will increase the importance and trade of the West Indies; and as Jamaica is on the direct route between New York and the mouth of the Panamá Canal, the volume of shipping calling at Jamaica for coal and repairs will be materially increased. The numbers of tourists visiting the islands, and the development of their agricultural resources, which may be said to be still in their infancy, will appreciate very considerably in the near future. Their strategic value will perhaps require a certain increased expenditure, so that Jamaica and Trinidad may be placed in an adequate state of defence. But anything expended in this direction will undoubtedly be money well laid out, and come back to us four-fold in the volume of increased trade and extension of cultivation which will be brought about in the next few years.

THE OLD YEAR.

BUT yesterday the year was young,
And now the curtain hides the scene;
The journey's not so very long,
Life's milestones not so far between.

For good or ill, in weal or woe,
Our throbbing world has held its way;
We've watched the moonlight come and go,
And revelled where the sunbeams play.

But some have smiled, and some have wept,
Like men upon a changeful sea;
And some for silent months have slept
Beneath the shady cypress-tree.

The summer sun may burn us now,
The thirsty land be bare and brown;
Gray clouds will kiss the mountain brow,
And gloomy skies will some day frown;

The grass will spring, and budding flowers
Renew their life with winter's rain;
But of the old year's puissant hours
Not one returns to us again.

NEVILLE BOSWORTH.

Chambers's Journal

SEVENTH SERIES

ADEN: ONE OF OUR OUTPOSTS.

By JAMES WILSON.

CROWDED passenger-boats on their voyage out east stop for a few hours at Aden to fill up coal-bunkers or water-tanks. A few of the more adventurous amongst those who crowd these steamers take a desultory walk to the shops in the Crescent, to buy cigarettes or ostrich feathers from the Jews and Parsees who trade in these commodities; others brave the dust, and drive out to see the tanks in hired motor-cars; and one and all return hot and tired to their ship with a fixed resolution never to repeat the experiment.

Aden has been tried and condemned on this scanty evidence by nearly every traveller driven by *ennui* or coal-dust into the maws of rapacious touts and traders; so a few facts, by one who has lately returned from its volcanic strands, may be of interest to those who have formerly regarded it as a mere milestone on a long and tedious journey.

Situated on the south coast of Arabia, in the province of Yemen, Aden certainly looks grim and unprepossessing, with its dark-brown irregular hills, and at the first glance like a barren deserted island, so low-lying is the mainland behind it. Some three miles to the west is a smaller group of rocks, known as Little Aden, with those peculiar-shaped peaks and pinnacles so common in volcanic formation. Between these two rocky promontories is the bay that forms the outer and inner harbour.

Little Aden is uninhabited, the whole settlement living on its larger confrère, which is some five miles long by three broad. On its east side tower the wall-like hills of the Crater called Shum-shum, and this range at its highest point reaches an elevation of nearly eighteen hundred feet. From this radiate and branch out the spurs and mounds on which the bungalows and houses are built, each headland, with its small cluster of thatched bungalows, being divided or cut off by small sandy bays or coves. Protecting the harbour are the two forts of Tarshyne and Morbat, practically impregnable, so buried are they in solid petrified lava. Up on the hills above are other forts, some in actual use, while others are mere ruins left to crumble away on dizzy heights, the sole reminder that the Turks once occupied these regions.

The town called Steamer Point faces the inner
No. 215.—VOL. V.

harbour, and here all the shops and business houses are situated, though the actual town of Aden is some five miles away, inside the almost circular wall of the Crater, where a regiment of British and another of native troops are quartered. The Royal Garrison Artillery, Engineers, and Eastern Telegraph Company live outside, on the more airy headlands facing the sea.

The map of Aden has the appearance of a big head supported by a very long, thin neck, for it is connected with the mainland only by a narrow isthmus. This was previously protected from Arab raids by strong fortifications where the northern range of hills meets the flat desert; but these lie neglected and deserted now, for the guns were dismantled, and the troops moved into the Crater some twenty-five years ago, as the isthmus fortification was feverish and unhealthy, resulting in much sickness and many deaths amongst the soldiers. Near these barracks, and buildings now used by the authorities as a dairy, is a fort called by the far from cheerful name of Last Retreat. It is built on an isolated hill, and was intended to be a refuge for the garrison in those early days. Almost at the foot of this hill at low tide can be seen, sticking grimly out of the mud, the cannons that once defended the land side of this peninsula; for the military authorities in those days, when dismantling their forts, had the guns thrown into the sea.

This isthmus is now defended by a corps called the Aden Troop, which is stationed at Khor Maksar, six miles out in the desert. It is partly a camel corps, the other portion being mounted as cavalry, and it is recruited in India from Punjabi Mohammedans.

A few minutes' drive from the isthmus in the direction of Steamer Point is the Arab village of Maala, its ugly square buildings sprawling in irregular fashion along the sides of the bay or intermixed with innumerable dhows in course of construction. This place, though squalid-looking and dirty, claims to be the oldest ship-building yard in the world, boats and ships having been built here in the time of the Queen of Sheba, when that lady owned Aden and the surrounding country. It has also the distinction of being mentioned in the *Arabian Nights Entertainment*, when a gentleman expressed a wish

[All Rights Reserved.]

JANUARY 9, 1915.

that 'a Jinn might fly away with a certain person, and drop him at Maala;' indicating that even in those days Maala was considered anything but a desirable place to reside in. It is, however, the door through which civilisation receives a great deal of its commerce from far-distant parts of Arabia, as is shown by the crowded Camel Serai and the native buggalows anchored off the little pier. It has also a claim far more romantic, as being the supposed resting-place of the unfortunate Abel; for Arab tradition has it that a small excavation far up on the wall of the cliff is the tomb of this victim of Cain's wrath, though no explanation is given how he was able to arrive at such an inaccessible elevation.

These legends, however, are always interesting, especially when so many people believe that Aden was the original Garden of Eden, and that the 'flaming sword,' as mentioned in Genesis, was this dried old shell of a volcano flaming fire and destruction on all around it, and in its general upheaval blotting out rivers and landmarks, to remain for ever barren wastes of desert sand.

It is under this excavation called Abel's Tomb that the road winds round to the Crater, which the traveller enters by the main pass, the road being cut through the solid rocky sides of the hill. And here he gets his first view of a town built in the interior of an extinct volcano. On the opposite side of this Arab town, called Aden, are the celebrated tanks, which are said to be capable of holding some twenty million gallons of rainwater, the water, when it does rain, being collected by a wonderful network of stone channels from all the adjacent hills.

The date when these tanks were made is not known, as their history is veiled in obscurity; but they are an indication of the ancient importance of a place celebrated for its bygone splendour; and when the traveller remembers that it is referred to in Ezekiel xxvii. 23, 24, as one of the cities whose merchants traded with ancient Tyre, he will look from the tanks to the town—wrapped in a shroud of lava, dead and forgotten by the world—with a good deal of sympathy for its fallen greatness.

A drive along the road that faces the harbour at Steamer Point, as the sun sinks behind Little Aden in the west, rewards those who have an eye for beauty with unique and gorgeous sunsets, the peculiarity of which is the orange and golden rays that shoot far up into the skies. These rays are common only to Aden and the Red Sea, and they are said to be caused by the sun dropping behind the peaks and high mountains in Abyssinia. The effect is as striking as it is beautiful.

This road and the Crescent, a kind of open plaza, which boasts a hideous statue of the late Queen Victoria, and many shops built under shaded porticoes, are always crowded, and one

may see as incongruous a sight as a taxi motor-car crowded with natives alongside a camel cart, or a string of camels with a Ford car plaintively bleating behind, asking the East to move faster.

The natives and foot-passengers are worth the closest attention, for they are just as strange and mixed as the traffic, and each type is clearly marked, such as the Somali (black-skinned, slim, with curly hair and clean white clothes), the Arab (muscular and fair-skinned), the Aden Jew (with his dark eyes, hooked nose, and lock of hair hanging down in front of each ear), the turbaned Hindus and Mohammedans from India, the comfortable-looking Parsees and Turks, the British soldiers, upright and smart in their khaki or spotless white uniform, with the passengers from the mail boats, whose clothes betray whether they are outward or homeward bound.

Those roads that face the harbour are extremely popular, as they catch any breeze that may be blowing off the sea; for in a place like Aden the question of air is of the first importance, and there are few conversations in which a reference—complimentary or otherwise—is not made to the breeze, as if it fails to spring up at night sleep is impossible in the still, muggy air, and if it blows strongly in the daytime dust almost chokes the unfortunate European who ventures out. The houses are built with everything open to receive the air, and remind one of huge trellis-work cages, very different from the bungalows in the plains of India, where thick walls and lowered *chicks* are necessary if one intends to live in comfort. In another respect, also, Aden is different. It has the advantage over its large neighbours of being practically free from mosquitoes, thanks to the lack of water; while snakes and other reptiles are never encountered. But there are rats, and as these come to the different bungalows to obtain water, the suffering exile sometimes finds them drowned in his tub in the morning.

Every one in Aden has a water allowance, and this condensed supply is brought round daily in a camel cart, and doled out at the different bungalows. The supplies and vegetables come from Somaliland in the small steamers that run along the coast; while Shaikh Othman, an oasis some nine miles away, and villages out in the desert, also send in their products to the settlement.

Shaikh Othman is the place where the residents of this rocky abode go to feast their eyes on something green; they crave for the sight of vegetation—there—and under the shade of a variety of palms and spreading trees they wander round the large garden until, refreshed and invigorated, they face the shimmering desert on their journey back to Aden. The drive through Shaikh is interesting, as it is the extreme limit of our possessions; and while thousands of camels are to be seen resting or feeding by the

roadside, on their journey from or into the interior, their owners sit on boxes or chairs at tables outside the row of little shops, eating sweetmeats or drinking coffee. For the Arab is as fond of his *café au lait* and the café life as are our French neighbours across the Channel.

The principal diet of the native is fish, and as from these waters they reap a rich harvest, he is well supplied in this respect; but the blue waters have also weird and uncanny monsters in their depths, such as the manatee, or, as applied to these seas, the dugong. The sea-cow or mermaid is found in the deep pools of Little Aden, and when caught in nets is stuffed and sent to museums in Europe. These large, seal-like creatures are harmless, unlike the octopus and many species of sharks that infest these waters. Both Europeans and natives have paid a very heavy toll with their lives for venturing into the sea; and so rapacious is a kind of dog-fish, or smaller breed of shark, that one runs a serious risk in even paddling along the shore. The other fish found here are the sword-fish, skate, saw-fish, and dolphin; while the rocks abound with oysters, lobsters, and crabs.

Aden is under the Indian Government, the administration being in the hands of a Military Political Resident, or Governor, assisted by a number of officers, whose knowledge of the natives, and their tact and *finesse* in dealing with difficult situations, make for harmony in the peninsula and the surrounding country. While their method of administering the law is as sound as it is surprising, there are no lawyers, and civil and criminal cases, in a variety of languages, are disposed of rapidly according to Somali or Arab customs and laws, or the Indian Penal Code, to the apparent satisfaction of everybody.

The Europeans stationed here are, of course, for the most part military, though the Eastern Telegraph Company has a very large staff, and there are others connected with the Port Trust, the coal industry, or in charge of shipping or banking agencies. Taking them all together, they are not a very large number; they are far from being unhappy exiles ticking off the

days until the time of their release like so many stranded Robinson Crusoes, but cheerful, light-hearted Britons, who for the most part speak in an almost friendly way of their barren rock, and make light of the many discomforts that are inevitable at this outpost of our Empire. This is largely due to what some foreigners contemptuously term our 'love of sport;' for both at Steamer Point and in the Crater there are golf, tennis, and hockey grounds, and despite the heat every afternoon these are crowded with busy players; while Khor Maksar boasts of a really first-class golf-course and polo-ground. For those who prefer something less energetic, both good fishing and boating can be obtained in the harbour, or one can join the party that goes on board the Indian marine boat, the *Dalhousie*, when the Governor takes this ship out to show his flag along the coast.

All this, however, would be nothing were it not for the Union Club, where all gather each evening to refresh themselves with the newspapers, bridge, or oysters, or to chat round the open-air bar, presided over by the admirable Joseph, with his cocktails of many colours. Upstairs, and overlooking the sea, is the balcony or broad terrace, where the whole world of Aden dines on certain nights to the strains of a military band, and these 'dinner nights' generally finish with a dance; for, though the ladies that bless Aden with their presence are few, they make up for their lack of numbers by the keenness with which they take the floor despite the tropical heat.

Even a Paget M.P. could not call the climate of Aden perfect, with its heat, dust, the complete absence of vegetation, and the brown monotonous rocks radiating the rays of the hot sun; but there is a good fellowship and feeling amongst the whole community that unites them closely together, and this, with the many amusements that are to be obtained on the peninsula, is the reason why so many pleasant recollections of its rocky hills are carried home to England when the soldier-man hangs his sword up on the wall, and tucks himself away on the shelf.

THE BRIGHT EYES OF DANGER.

CHAPTER VII.—IN WHICH I MEDDLE WITH OTHER FOLKS' AFFAIRS.

I RODE down towards the Lang Dykes slowly, a light wind singing around me, fresh and crisp after the closeness of the town. It was a bracing morning, and when I reached level ground I broke into a brisk trot. The mare put the road behind her, and I did not draw rein until miles lay between me and Edinburgh. I had no knowledge of where I was, nor did I care. To feel the good beast under me, to see the branches of the trees tossed by the wind in

the sunlight, the white little clouds chasing in the blue, were enough for me. I cantered on aimlessly, and after an hour and more came to a place with tumbled sand-dunes and stretches of turf between them, so near the sea that I could hear the waves curling on the beach. There was a little bunch of trees near me. It looked snug and sheltered, and I bethought me of a rest and tobacco. I had scarcely my foot out of the stirrup, and my horse

tethered, when I heard rough voices. The trees fringed a hollow, and, well in their shelter, I went forward and listened. In the hollow were three men, one at bay, with his back to a tree, his hands on guard; but I read deadly extremity in his eye. The other two, uncouth, bearded, squat fellows, wore the kilt.

I got me behind a tree and watched. All three were so intent that they neither saw nor heard me. There was a scurry of feet as the two men feinted on either side of their quarry. He defended himself, hands and feet going vigorously, but the end was palpable. The unfairness of it stung me. They had nearly closed on him, when I slipped behind, and, seizing the bigger one, gave him a very pretty toss that I had learned in many a stiff wrestling bout in Westmorland.

The fall stunned him. He lay very still at the bottom of the hollow, and a fear touched me that I might have broken his neck. But, as I looked, he opened his eyes, and sat up slowly, dazed. I was relieved, for if it be one thing to plume one's self on tossing your man in fine style over your shoulder, it is another to see him lying in a motionless huddle. He looked past me, over my shoulder, and my eyes followed his. Behind me, on the top of the ridge, was a woman on horseback. Horse and rider were as still as a carving; and, looking at her, I, who had just thrown my man cleanly, glorying in the play of my young muscles, suddenly felt awkward and ashamed, like a rude schoolboy caught in some offence. I hope I did not hang my head. I know that I felt like it. There was silence for a moment, horse and rider picked out in the clear September morning as clear as in a picture. I gathered courage, and looked straight in her eyes. They were hazel and long-lashed, and bent on me with a keen inquiry in them that shamed me where I stood. There I stood like an oaf. I bethought me to address her, to ask pardon for the violence in her presence. But I got no further than to open my mouth, my thoughts stampeding under her steady gaze, and when she spoke, despite her calm air of reproof, her voice came to me like a chime.

'You were about to say something,' said she. A spark shone and vanished in her eyes, like a glint of light on a stream.

'I did not know there was any one near,' I began, 'when—when'—

'When you sent my servant a-sprawling. You might have killed him, young man.'

True it was that I was young, but I was older than she was, yet the words 'young man' came with such an engaging air that I forgot to pass any comment on them.

'Your servants think little of fair-play, madam,' I ventured. 'At least they do not scruple to attack a defenceless man.'

She nodded twice slowly, gravely, looking at me with composure; and, after a pause, as if pondering over my words, she said, 'I think

men generally get as much or as little as they deserve.'

'In the next world,' I hazarded. 'Not always in this one.'

'I said "generally,"' she said, again with the prettiest air of authority and correction. 'And I am right.'

The momentary spark in her eyes invited and defied contradiction.

'It may be that you are right "generally," madam. I do not know, but in this particular'—

'In this particular you also do not know. This creature'—she pointed with her riding-whip to the man still standing panting with his back to the tree—'may thank his stars for your appearance, for 'tis little mercy he deserves. He has been watched. He is, or would have been, a thief. He must be punished.'

'I may be his accomplice for aught you know.'

Her colour fled suddenly at my words. I could see that her air of calm authority was but surface-deep, and that she was scarcely more than a girl, her emotions barely under control. My heart smote me, and I made haste to add that if I were to begin thieving I would aim higher than hen-stealing, or whatever the rascal was after.

'How—how came you here, near The Garth?' were her next words.

'I have no idea where I am, or what The Garth is. I was out on a gallop from Edinburgh. I chose a pleasant road.'

She sat very still on her horse, looking at me.

All this time the man I had thrown had been sitting on the bents, his companion kneeling beside him. The lady on the horse and I had scarcely looked their way; but, on a sudden cry, I turned round just in time to see the man whom I had rescued whisk round the tree and run like a deer into the wood.

'Quick! quick! He must not escape,' she called. The kneeling man sprang to his feet, and ran in pursuit, and in a trice I joined him. The fugitive had the advantage of us in that he was evidently familiar with the pathway, for twice or thrice we took the wrong turning. My companion was soon winded, and I ran on alone, sure of overtaking the fleeing man if once I caught a glimpse of him; but the undergrowth was thick, clutching at me time and again, so that I stumbled and lost ground. I could hear his footsteps plainly enough on the pathway. They sounded, I thought, nearer every moment. I was overtaking him, and a 'ride' in the wood at last showed me his flying figure less than fifty yards in front. He was close to the corner of the wood. Soon he rounded it, and I sped on at my utmost speed, in a fever of anxiety lest he should escape. When I turned the corner I came to a sudden stop, chagrined and angry. The man was not twenty yards from me, but he was mounting a horse! He swung himself into the saddle, looked round for an instant as I came up to him,

and then made a furious slash with a knife. I jumped back only just in time. Next moment he was off at a gallop. I stood stock-still, panting, listening to the hoof-beats mocking me, until their sound died away in the distance. There was nothing for it but to swallow my discomfiture with as good a grace as I could.

The situation was curious enough. I had come to the rescue of a man in danger, and now, at the bidding of a slip of a girl, I had been chasing him as if my life depended on his capture. Who was the girl? Whose was the house called *The Garth*, for I assumed that it was a house? Who was the fleeing man, in whose swift look at me I had read murder, who dreaded capture so much that he would have knifed me? Question chased question round and round my mind. In a maze of conjecture I walked back to where I had left the lady of *The Garth*. About half-way I met the fellow who had started along with me in the pursuit. He was elderly, and blown from his exertions, and when I told him of the chase and its end all I could get out of him was the single word 'horse,' which he repeated like a parrot after me until it dawned upon me that he could not speak English, and was probably one of the Highland army. This made some food for reflection, for I was fixed in my mind not to help the Pretender by so much as a thought, let alone a lift of my sword-hand. I could not speak a word of Gaelic, so we trudged along in silence until we came near the open space among the bents where I had seen the fight and the lady on the chestnut horse watching it.

She had dismounted, and came a little way to meet us, the man whom I had thrown leading her horse. I told her what had happened. She listened until I had finished, and, turning to the two men, said a few words in Gaelic to them, dismissing them, I took it, for they went away, leading the horse with them.

'I give you my excuses for speaking to them in their own tongue. They understand no other,' said she. I remember the sunlight playing on her dark hair.

'I am in equal plight; my only language is the English one. If I did you a disservice, it was done unwittingly, on the spur of the moment, when I saw a man fighting against odds. If I can atone for it command me. My name is Edmund Layton of Westmorland.'

'Then you are for King George,' she said, and there was no coldness, only a world of regret in her voice. How often, thought I, would I be obliged to explain that I was not bearing arms for either side? But as I looked at her, for the first time, I could almost have wished myself under the White Cockade. For the girl was in evident trouble. She turned away her head from me to hide a threatening of tears.

'King George is my sovereign, but surely this matter of an escaped thief has little concern with

the great affair betwixt him and Charles Edward,' I ventured.

She turned to me with a sad little gesture, and looked long and earnestly. 'I cannot—must not discuss it. You are a stranger—a Hanoverian,' ignoring my gesture of dissent.

'I have told you that King George is my sovereign; but I am not in his Majesty's army. Even if I wore the king's uniform, loyalty to him would not forbid my offering you my help.'

'Unless it clashed with your duty; and that would be right, for duty is duty.' She nodded again with the same grave inclination of her head. 'But sometimes duty is difficult, is it not?'

'I have never found it so,' I answered. (I was only twenty-three.)

'Perhaps, then, you have never been tried.'

Something in her tone, or perhaps the glint of a smile that hovered for a moment in her eyes, ruffled me. It may have been that what she said, with its reminder of my youth, was true. Come to think of it, at my age one has seldom been tested; but to be calmly told so by a maiden in her teens was a new and humbling experience. I was silent, meditating on a reply sufficiently dignified, but found none; and with a sudden sweet change in her voice she said, 'If ever you hesitate in your duty between two roads, pray Heaven you choose the right one.'

Her voice was soft, gentle, low, that excellent thing in woman, and she looked so fair and young and troubled that I hesitated no longer.

'I will be plain with you, madam. It was by the merest accident that I came this way. I am a stranger to you, and you to me. I make bold to say that you are in trouble, if not danger. How, I know not; but if I can do you a service, pray command me. Believe me, I am in nowise concerned with the strife and intrigues between Stuart and Hanover beyond avoiding them.'

'You choose a strange way of avoiding trouble by offering your services to me, Mr Layton.'

'Why?'

'I cannot say more than that it is so. But, you are wounded. See!'

She pointed to my hand, and, sure enough, a thin red trickle was running down it. The sleeve of my coat showed a little cut half-way between wrist and elbow. The man who had escaped must have grazed my arm when he struck at me with the knife, but in the press of the moment I had not felt the slightest touch from him.

'I am more concerned about the danger to yourself or your household,' I said. 'It is evident that you have had a visitor who sticks at nothing to gain his own ends, whatever they may be.'

'He is but a tool, I fear. But I am standing here and talking, while you are wounded! You must come with me to the house, and I will see that

your wound is looked to. Come! We must not be lingering here.' She looked round in a swift glance that took in the curve of the sand-dunes and the woods that flanked the house.

Now, in most of the tales I had read, the hero (to ensure the title by calling myself one for the moment) in a situation like mine would have scoffed at his hurt for a trivial scratch, thereby impressing the lady with his valour, and then would have ridden off in a glamour of complacent chivalry. For a moment I leaned toward this heroic pose, but for a moment only.

The mystery of the desperate fugitive, the lonely surroundings, and a vogue for excitement that I have never been able to subdue drew me like a magnet. Love of adventure, a glorified and justifiable curiosity, called me; and the girl's eyes were hazel, an adorable short upper lip trembled between tears and a smile, and her hair, dark and fine-spun, caressed the whitest, roundest young neck in this world.

Next moment I was walking beside her towards the gateway of the avenue.

ORGANIC METEOROLOGY.

A RETROSPECT AND SUGGESTION.

By A. BROWN.

THE weather prophet we always have with us—'The summer is to be a dry one, the winter severe,' and so on. If wrong he is laughed at if people do at all remember, and if he is right he does not let it be forgotten what he said so many months before. All this guessing does not put us 'forrarder;' the years roll on, and we take the weather as we get it, because, as the philosophers say, we cannot make a better of it, which is so absolutely true.

Ever since history has spoken, to foretell the future has been a fascinating subject. Egyptian or Assyrian astrology looked up for guidance amongst the fixed stars or to the conjunction of planets for its story, and with pretence read the life of the new-born child from the cradle to the grave.

The revival in all things Egyptian brings back something of the life-interests that surrounded the Rameses; Amenhotep and Menepthah (the Pharaoh of the Exodus) are made to stand before us in more living colours than the biblical story can embody for us. As men they lived their lives full of human traits which make their experience even now of priceless value; and the more valuable as it is conceded that, with all the changes of time and experience, fundamentally our nature has not materially changed. It is not, however, there that we lose.

In the course of centuries one wave of civilisation succeeds another, in appearance quite naturally; and what one thought of value the next neglects, or through misadventure in the long run of revolution or evolution loses entirely. When did men lose the pottery industries of ancient Babylon? Or when did they lose the dentist's skill which modern discovery has shown existed before the Laws of the Twelve Tables were set up in the Roman Forum in B.C. 451? No one knows either how or when; all that is known is that they were lost arts, and only

within the last few decades are the threads being picked up again.

The evolution of human society gains, no doubt, at each tide-flow of civil government, the field of vision—human outlook—is wider, and the grasp of human possibilities is more firmly held. The next flood may not reach so far up the beach, yet the whole gain is perceptible; for the next, or the next after, reaches farther up, the human perspective is clearer, and we now use ideas which were until recently forgotten, and can use them with an effect which the ancients had no chance of attaining from want of auxiliary knowledge.

Divination had, during the long course of Roman dominion, a firm hold on the whole body politic in the Imperial City; the Greeks before them had the same faith in the outward signs of nature. The Romans went into no important business without first ascertaining the will of the gods by means of divination—*nisi auspicato, nisi auspicio prius sumto*. From the earliest period of their history this was the invariable rule both in private and public undertakings. At first the patricians alone had the right of taking the auspices; and, as their destiny evolved itself, class privilege was used and abused by them for their own aggrandisement against the humbler plebeians. In case of public proceedings the supreme magistrate, and latterly the emperor alone, had the right. An army in the field, as is well described by Livy in his history of the struggle of the Romans with Hannibal, was guided in emergencies by the auspices taken by the commander-in-chief. Birds were the objects observed in taking these auspices—*auspicium, ab ave specienda*; it was to their flight or their cries or feeding that attention was given, as indicating what was going to happen. The whole system materialised into a fatalism that is repugnant to us now. Through the Roman story we note how, as time went on, human deceit took advantage of ignorant credulity.

and frequently it was used only to abuse the trust placed in the higher official of the State.

In later times the system of divination was applied as an agency of procedure for delaying any rash suggestion; to give a breathing-space, the chief magistrate would make a declaration that as he was watching the heavens (*servare de caelo*), the will of the gods was not yet fully known; and so the deliberative assembly must, forsooth! cool their ardour by reflection for a little till more cautious counsel had made its legitimate effect felt. We know how Julius Cæsar and his satellite Vatinius, in B.C. 59, made short work of such tomfoolery; and it was later, on that ground, that his opponents in the Senate declared that all his actings were *de jure* null and void. The Romans had a truth in their grasp; they pushed it to extremes, made a fetish of it, and it went, like all such, to oblivion.

To Rousseau's saying, '*L'homme qui médite est un animal dépravé*,' what answer does modern experience give? As an appeal to feeling it is but a half-truth to rely on the dictum. In the *sauve qui peut* position, no doubt, he who hesitates is lost; but to-day everything is up to date. Thought says, 'More thought, more thought, more thought,' on the observations of life and nature around us. Nothing is more common than the rush of towns'-people to seaside resorts, and it is a common observation to see these holiday-makers gaily facing the pending thundercloud, oblivious till the first raindrops fall. The revival in nature study is the latest turn in the tide; it may be said that the auspices are favourable without awakening suspicions that we expect the next flood-tide to be far beyond the mark where Julius Cæsar left it.

In his address to the St Andrews students as their Lord Rector some years ago, Lord Avebury pointed out that scarcely was the full life history known of any one species of bird. All observers know how closely Nature keeps her secrets, but there are facts known and knowable which should be more generally recognised and collated.

The weather reports of depressions, lines of pressure, are gauged and reasoned out on scientific principles; yet we cannot predict satisfactorily, though we are closer to that than we once were. So we think, till the next deception cheats us of our triumph.

What now is pleaded for is that of all living creatures birds alone may be said to have the air as their natural element; they have a field of view more constantly wider than we can have, and at all times can be seen in it. The law of self-preservation is to them, as it is to man, the first law of nature; and, acute and observant above all things, they act unfailingly on it.

In other departments the extended senses of

lower animals are being utilised. We have the police dogs, and the war-dog ambulance service is used on the Continent. But what, it may be asked, can we learn from birds? Scientifically it has been shown that lower animals have in the matter of vision not only a greater range than man has, but their receptive faculties actually take up rays of light which on the human eye make no impression. The same is true of the sense of hearing; sounds are heard by lower animals which do not even arrest the most acute human ear. The weasel and stoat are examples of this extended ear-power at the treble end of the scale. The proverbial watch-dog or the geese of the Capitol at Rome are proofs positive of the general admission of their more acute hearing even of those sounds which are within the human compass. But what, then, of birds? Of all the lower creation, their position for observation exceeds both intensively and extensively those of all 'mere creeping things.'

In a perfectly clear sky two nights before a storm of snow and wind, in the quiet starlight, the wild geese cackle is heard passing over the lighted town. Did they smell the wind? Did they see the snow? Did they hear Boreas take counsel in the far north two days before we knew it was on us? They came—that we know—and the weather followed; let us not be accused of the fallacy *post hoc, ergo propter hoc*. Let it be conceded for argument, if you will, that there is more in heaven and earth than is dreamt of in our philosophy.

Again, the ordinary ringdoves (*cushats*) have their numbers augmented in the winter by migration from the Continent—from Norway, it is thought. Recently, from the pier of a small town on the eastern seaboard, flock after flock of these wood-pigeons were seen passing in from the sea for over an hour, and scattering inland. The next day a terrific gale, of which there was no warning, burst on us, ending in snow and sleet lashing from the north-east. Now these birds come from parts with which there is little or no communication. It has been found that in full flight they can fly anything from one hundred to one hundred and fifty or two hundred miles an hour, which would bring them here hours, and it might be days, before the first touch of the most terrific gale that ever blew could strike our shore. Such observations are noted as a source of wonder; but there is no collation, no tapping of this source of foreknowledge. It might be said that a few hours' foreknowledge could not matter much. That is a mistake, and telegraphic information as established is not effective.

Observation on bird movements is a factor not to be ignored in weather forecasting, which helps to a reduction of loss of life and property by land and sea—a loss which never fails to follow in the train of a storm.

PEDRO'S WAY.

CHAPTER II.

THAT night, when Billy got back to the plant, he found Pedro, well groomed and spruce, waiting for him. Billy put him to clean his boots and spurs, and went to dinner. After dinner he told him to get some supper, and that he could find a good bed for the night by asking for it at the *peon* quarters. Pedro thanked him, and went off.

Next morning early Billy woke, and decided to go for a swim in the river. He opened his bedroom door that led out to the veranda, and a form sprang up before him. It was Pedro; he had slept the night on his master's doorstep.

Billy told him it was unnecessary, as there were no thieves at the plant.

But it had no effect, as afterwards Pedro always slept there, for, as he said, 'Who knows, *señor*, but that you may require something in the night, and I should feel most unchristian were I not there to get it?'

So time went on, and Pedro proved successful. His knowledge of horses was great; he also loved them. His knowledge of Billy's wants was greater still, and his love for him amounted almost to a madness. 'Everywhere where Billy went his *mozo*'s sure to go,' said some one at the plant; and so Pedro was alluded to as 'Billy's little lamb.' But Pedro was anything but lamblike, as on occasion he proved.

Once an American came to him and asked for the loan of one of his master's saddles. Very politely Pedro informed him that without his master's permission he could lend no saddles. The American tried to push past him, so Pedro knocked him down. The American got up and drew his gun, threatening to 'fill him full of lead.' Pedro was used to this sort of thing, so he took the gun away, and severely injured the 'gun fighter' in doing it. This meant trouble for Billy; but he backed up his *mozo*, and in time people learnt that Pedro was best left alone.

Soon after the rains Billy Harding went on a long trek across two states. Four months they were on the road, Pedro growing more devoted to his master daily. Their wanderings took them away up into the mountains, into the pine-country, where it froze at night; then they would scramble down rocky tracks to the scrub-oak belt, and through that to the barren alkali flats, where they would curse the heat and long for water. They would make their camp and chat together, Pedro learning many things, and Billy gaining much inside information into the life of his desperado. They understood each other so well now! Pedro had found it hard to live, and he had done many things in his life that were not conventional. His confessions sometimes startled Billy; but Billy understood the force that had

driven this half-civilised child of the mountains into corners, and he never showed surprise. He gave advice without seeming to preach, and Pedro made of him a god on earth. Never did he slacken his duties. He showed his master a secret of his—how to cure the horses' sore backs on the march: a secret he guarded jealously.

Up before daylight, he would light the fire and make a cup of tea for Billy, because once Billy had mentioned that in England tea before rising was a luxury. Then, if they stopped in a village, Pedro would never talk. No one would gain anything by questions; Pedro would simply lie to them. He always conveyed a feeling of security to his master. It would have taken more than an ordinary bandit to rob Billy, for Pedro was never far off, and the two of them would have been a nasty handful to tackle.

Whenever they struck a post-office Pedro would ask his master for some money from his wages; then he would buy an envelope and a money-order. Billy would address the envelope, and always it was the same direction—to Pedro's daughter. The money was to help to support Pedro's grandson, whom Pedro had sworn never to set eyes on.

One evening, as they were resting after building camp, Billy asked Pedro if his wife still lived.

'Yes, *señor*,' said Pedro, and the fierce look came into his eyes. His face, that now usually wore so contented an expression, often smiling, completely changed as he rose and went over to the pack-saddles.

'Oh,' thought Billy, 'there's another tragedy in the poor beggar's life. I wonder if it ended violently like the last; or perhaps it has not ended—yet.'

But on this point, and this point only, Pedro kept his own counsel. Billy never questioned him again, and he never volunteered information.

Soon they got down into the hot country, and day by day rode through a jungle that smelt like an English hothouse, and was quite four times as hot.

Billy would ride under the bamboo-branches sweating at every pore, but infinitely happy. They had struck a town. In that town there was a mail waiting, and one letter in the pile had made Billy's heart jump and beat like a mad thing. It conveyed the fact that 'she,' the only 'she' in Billy's life, had kicked over the traces. She was sick of England without Billy. She knew she would love Mexico, or the lower regions for that matter, if she only had Billy. Uncle Paul was an angel; he had consented to bring her to Mexico City. And then, perhaps, if—Well, Billy should decide.

Billy saw things in rainbow colours, paid a man 2 per cent. more for a bunch of cattle than he would have dreamt of doing had he been sane, and then told his *mozo* the glorious news. Pedro took it politely, but his face fell. From that day on he never let Billy out of his sight, but he hardly ever talked.

Billy noticed it; but he knew the charms of that girl of his, and how quickly she would win Pedro over. Sometimes at night, in camp, the lover would wake to find Pedro sitting on the ground in the moonlight, his chin on his knees, gazing away into the mists.

Pedro's heart was nearly breaking; for how could he look after and be near a master when that master loved a woman? Pedro knew the selfishness of love.

So the sun blazed down on the happy Billy and the miserable Pedro day after day, and the night mists came up every night and lay round their naked bodies like a warm blanket as they lay awake—one because he was happy, and the other because he was eating his heart out with a new-found jealousy.

Then they struck the railroad. It was a sad day for Pedro, because his master left him to go up to Mexico City, where he hoped to hurry the marriage. Pedro was to take the pack-mules and ponies back to Uruapan, and engage servants to put the house in order.

Pedro felt that the sooner back the better; so, as his master steamed out of the station, he saddled up and started, leading one pony, and driving the mules before him. He cut records on that journey, changing from one pony to the other, often walking. His whole mind was centred on keeping his cattle fit, so that he could reach home quickly and have things comfortable for his master on his return. As for his master's bride, that was another matter, and Pedro tried not to think of it. The last two days of the journey Pedro and his animals covered a hundred miles.

Billy's wife arrived with her happy husband at the plant perfectly radiant. She was of the fair type, and bubbling over with the joy of living. She had heard all about Pedro, and when they met offered her hand. Pedro bowed over it like a grandee of Spain, made a polite little speech, and went about his duties.

Then came a long time of torture for Pedro. He saw little of his master, and when he did he was always accompanied by his wife. They seemed absolutely taken up with each other. Billy had now a permanent job at the packing-plant. He bought the cattle as they came in, so the long treks were over. With them were gone the talks with Pedro; and day by day the *mozo* felt it, and his jealousy grew. If he could help it he would never approach Mrs Harding; and she, in her turn, thought him taciturn; but, never having known him as anything else, she refrained from talking to Billy about it. As for

Billy, he seemed to have forgotten everything but his wife. So things went on getting worse for poor Pedro, and he was almost on the point of leaving to work elsewhere, when Billy announced his intention of going on a two days' trek. He wanted to have a look at some pasture-land twenty miles away, and told Pedro to get the camp equipment ready for the following morning.

Pedro was delighted. Two ponies and a pack-mule, and his master and he on the road again! Two whole days he would be alone with him, and a night. The joy of a night in the open, making camp and cooking; the pleasure of sleeping under the stars!

Next morning, before daylight, Pedro had the mule packed and the ponies saddled, so that as the sun rose they started. What a day that was! Master and man talked together like friends. They spoke about the merits of their ponies, criticised the last bunches of cattle that had come in, joked and laughed away the twenty miles of track.

In the early afternoon they reached the pastures, and Billy rode on to inspect them, leaving Pedro to make camp. 'An hour, *señor*,' sang out Pedro; 'be no longer. I have a good supper that won't keep.'

A good supper it was—one of the old sort—chicken and chillies and beans, followed by a kind of fruit-jelly; then coffee in tin mugs—real Uruapan coffee.

Then they rolled themselves up in their blankets and began to talk. They always did this in the old days, talked till they fell asleep, one smoking a pipe, the other innumerable cigarettes.

Presently Pedro was silent. Billy watched the dark pine-tops above him, and listened to the stream at his feet. Then he sat up and took great breaths of air into his lungs. 'Oh Pedro,' he said at last, 'what a grand life this is!'

'This life of the road, *señor*?' asked Pedro.

'Yes, of the road, in the mountains, down on the plains; anywhere where the air is sweet and there is no roof, where you carry your home on a mule's back, and your food in a cartridge-case.' And Billy sighed as he sat, for the call of the road was on him.

Pedro was sitting upright now, looking intently into the dark pine-trees. 'This is the *only* life, *señor*,' he said.

'Pedro,' Billy ran on, 'do you know, I love it all. There's only one thing above it—my wife. If anything happened to her, any terrible thing, I should just pack up and trek into the mountains with you, Pedro, right away from the world of man; to be free, to try to live it down.' Then—as if ashamed of his outburst—he quickly burrowed down into his blankets. 'What utter rot I talk!' he said in English.

There was silence for a while but for the ever-whispering pines. Then Pedro in a low voice repeated, 'This is the *only* life, *señor*.'

But Billy never heard it, for Billy slept.

Next day all the old comradeship was continued until they were within two miles of home. Then Billy said, 'You come on quietly with the mule, Pedro. I'm going to hurry back to the *señora*.' And in a whirl of dust he was cantering down the road.

Pedro's thoughts came back with a jerk. His brief dream of the old days was gone, leaving him in a bad way. Always that woman before himself; quite natural perhaps, but possible to remedy. Then Pedro began to think; and, because of his half-tamed and passionate nature, his thoughts were bad.

A few weeks later Mrs Harding made up her mind to go to Mexico City, there were so many things to be bought for the house. Billy, owing to a press of work, could not afford the four or five days to go with her, so she was to go alone.

Pedro heard of this in a roundabout way; he was an outdoor servant, and Billy never thought of mentioning it to him. Then his brain got working as no rightly balanced brain could ever work.

Uruapan is in a large valley; to the north are mountains up which the railroad winds. In and out it twists, sometimes nearly looping back on itself in its efforts to find the easy grades. Only two passenger-trains pass over the line in the day, one from Uruapan at seven-thirty in the morning, one into Uruapan at six-thirty in the evening. A down freight-train comes into Uruapan an hour after the six-thirty passenger-train. So through the whole of the night not a train runs up or down the mountain until the morning passenger-train passes.

The day before Mrs Harding left, Pedro asked if he could have a day off and a horse. Both were readily granted him, and away he went. His road lay straight north through the mountains—a steep track, but in consequence far shorter than the railroad. He came to a place where the line ran out and round a kind of bluff. The track here was level, and the train would take the corner at a good pace, despite the sheer drop of two hundred feet on one side of it. Pedro picketed his horse among the pines, and lay in wait beside the permanent way.

The passenger-train passed, and then just before dark the freight-train. Then Pedro got to work. From the grade above he rolled a large rock. Exerting all his strength, he screwed and twisted it on the inside rail. This accomplished, he considered his work. Yes, there would be no time to stop; the cow-catcher would hit the rock, deflect the bogey off the rails, and engine and train would crash two hundred feet on to the trees below. And with the train would fall his master's wife! Never for a moment did Pedro give a thought to the forty or fifty other lives he was throwing away. His soul was black with hate, and for the time he was mad.

He threw away his cigarette; it lay near the rock. That reminded him he must be careful, and he picked it up and obliterated his tracks. He struck a match and looked at his watch, one Billy had given him. It told eight-thirty. Well, in eleven hours that thing would have happened that would drive his master back to the road again, back to him. He was well aware of the pain it would cause him, but he thought of the wild life before them, and knew it would heal. Great pain, great sorrow, for a while; then peace, the peace that comes with the open air, with nature. He turned and walked to his horse, mounted, and slowly rode back into town.

He slept that night in Uruapan, and next morning rode out to the plant. On his way he met Billy bowling along in a dogcart to catch the train. Billy pulled up. 'Good-morning, Pedro,' he said.

Pedro raised his large sombrero.

Billy went on, 'I forgot to tell you the *señora* goes to Mexico to-day.'

Pedro tried to look surprised. The *señora* smiled and nodded; she was getting on quite well with her Spanish.

'Yes,' Billy continued; 'and there is a man at Patzcuaro who has cattle to sell, so I am running up on the same train to have a look at them. Back to-night.' And with a flourish of his whip and a cheery good-bye he was off at a hard trot.

For a moment Pedro sat as if turned to stone. Patzcuaro lay on the other side of the bluff! Not far, but still on the other side, and his master would be aboard the train. Then his thoughts began to work like lightning. He could gallop to the station and warn the railway people; but that would never do, for how was he supposed to know the rock was there? Warn his master? Worse still. No, there was only one way: race the train to the bluff.

To think was to act with Pedro, and like a flash he swung his pony at the high bank flanking the road. With a scramble he was over in the maize-field beyond, galloping direct for the mountains.

He had the shorter road to go, but it was muscle *versus* machinery. Pedro knew it, and he never spared his mount. Straight up he went, sitting forward in his saddle, helping his fast-tiring pony all he knew. Presently he heard the train below him gasping and panting as it climbed. It sounded desperately close, and he laid his quirt across and across his pony's flanks, and the game little beast shot forward, battling against the steep incline. A gap in the belt of pine gave Pedro a glimpse of smoke, and he plied his spurs. The pony stumbled, saved himself, and struggled on, his breath coming and going in great gasps; another hundred yards and he was down.

Pedro was on his feet in a second, and a glance at the pony showed him that now he had to do it afoot; so away he sped up the

mountain. Leaving the horse-track, he climbed and ran out into the clearing, and there was the bluff before him; a final spurt and he reached the rock. Then began a struggle. He tried to push the rock off; but last night when he had placed it he was fresh; to-day he was exhausted with his race up the mountains. He paused a moment, wiping the sweat out of his eyes; then he heard the train again. Of course as a last resource he must run to the curve and flag it; but Billy would know, and he was no fool; he might put two and two together. No; one more try. This time he tried pulling, and he got his fingers in a niche and leant back, and the rock moved! He put one foot on the line and strained hard. Up it came and over—over so quickly that Pedro fell backward, and the rock rolled right across both his legs. For a moment he lay in agony; then he tried to free himself. The pain was too great. He thought his legs were broken, and he lay back. The train panted in the distance, and now that the danger was over it seemed a long way off. Pedro got his hands up to the rock, but it was useless. He began to think. The train would stop; his

master would see him. There would have to be explanations. Lies would do for the most of them, but not for his master.

Then the horror of the thing that, in his mad jealousy, he had nearly done—would have done had it not been for Billy's sudden call to Patzcuaro—dawned upon him in all its ghastliness.

Pedro groaned aloud, and the noise of the train drew nearer. How could his master ever forgive, ever forget? He understood many things, forgave readily, but this madness never. The train drew yet nearer. Pedro gazed round him bewildered, desperate. The gasps of the climbing engine were getting quicker; they had reached the level before the turn. Pedro screwed sideways in spite of his pain, and watched the corner for the coming train; then he thought of Billy's eyes when he had learnt, or guessed, the truth. That was a thing he could not, would not, face.

So, with a gasp, he wrenched out his revolver, put the muzzle in his mouth, and pulled the trigger.

THE END.

POTTED HYGIENE.

A PAPER SUBSTITUTE FOR CANS AND BOTTLES.

By ROBERT T. PATERSON.

THAT pessimistic pronouncement, 'Man never is but always to be blest,' would lose much in its application, and more of its accepted truth, were it possible to render man's body, and incidentally his mind, immune from the insidious attacks of noxious evolution as a result of the insanitary condition in which various articles of food are often supplied to him. Much has been done in this connection since the 'bad old days,' but that much remains to be done is evidenced by the continued and increasing war waged against Nature in her evil presentments.

The urban gentleman who was horrified by his first view of milk being extracted from a 'beastly cow,' whereas he was accustomed to obtain it from a 'nice clean can,' may have unconsciously aroused the first suspicion as to the alleged cleanliness of that universal receptacle. However this may be, there seems to be only too good reason to look askance upon the methods of milk-handling in the populous centres of Great Britain. Milk is a necessity; but while much that is tragic can be traced to its use, as a result of insanitary treatment, there is no reason why it should come to be regarded as a necessary evil were but proper methods of handling it employed. What constitutes proper methods has provided a theme for much expert and inexpert discussion, and amid the rattle of tin cans and the crash of bottles the wordy war has been waged. So im-

portant has the question become that it has recently been the subject of legislative inquiry—proof, if such were needed, that it has long passed the stage of academic study.

Were milk alone the victim of malign influence it would amply merit the interest which its preservation therefrom has aroused; but unhappily we have grim evidence that many other things designed for human consumption become the hapless object of the attentions of the besieging bacillus. To name a few of those which to-day, in the interests of alleged preservation, achieve the cold *hic jacet* of a tin—fish of various kinds, meats in endless variety, baby foods, preserves in their multitude, poultry, and that protean 'bag of mystery' the sausage—all these may suffer something more than a 'sea change' when the hordes of merry bacteria get busy.

It is perhaps meet that, in a country where they 'eat what they can, and can what they can't,' there should be instituted a revolution which in this connection brings matters literally to a climax. That it might appropriately be termed an anticlimax is borne out when it is stated that the erstwhile tin bids fair to be ousted by paper! In the United States of America there has been placed on the market a very cleverly designed 'container' made entirely of paper, in which, moreover, no glue or other messey substance is to be found. Passed through a

paraffin bath, which renders it liquid and worm and weevil proof, the paper is formed into cylindrical cartons, the inner case of which becomes hermetically sealed when closed, and so defies any form of bacteria; and, being non-radiating, it will preserve milk, ice-cream, &c. at the required temperature for a very appreciable period of time. These cartons are intended for single service—that is to say, when emptied of their contents they are discarded; but we can imagine the economical housewife according them an added regard when, as most efficient firelighters, they thus achieve apotheosis!

Three other classes of cartons supply demands appropriate to their design. We have seen that the liquid-proof containers hold dairy produce, and may also be used for oysters, shrimps, honey, jams, jellies, &c.; then the butter-containers carry out their obvious destiny; while those de-

signed for holding oils, grease, lard, sardines, &c. explain themselves. A fourth form is used for dry products, such as tea, coffee, sugar, spices, baking-powder, tobacco, &c., so that practically everything which involves carriage and delivery in compact form is provided for. In the matter of fragility there is nothing to fear, as these cartons, though made of paper, will bear the weight of a man. This apparently practical and really simple solution of an acknowledged sanitary difficulty has an added interest alike for manufacturer, exporter, and consumer in the matters of first cost and freight charges, for the cartons, while strong, are also light and easily handled.

It is the intention of the Climax Container Company, of Chicago, to place these cartons on the British market, when it is to be hoped the dread spectres of ptomaines, *et hoc genus omne*, may flee away into a belated oblivion.

THE DECOY.

By TAFFRAIL.

IT was exactly three days before that the scurrying seaplane, streaming westward to her 'mother ship' after her hazardous reconnoitring flight over the enemy's territorial waters, had reported one of the hostile battle-cruisers to be lying at anchor to the southward of the island of Norderland, with several light cruisers and destroyers in the inner anchorage. Of the remainder of the High Sea Fleet, that vaunted and much-advertised collection of vessels, neither she nor any of her aerial sisters scouting in other areas had sighted a trace.

Definite information as to the whereabouts of the enemy's main force was lacking, except perhaps at the Admiralty. It was nowhere in the North Sea, that was quite certain, for at stated intervals the British cruisers had swept right across its entire expanse to within ten miles of the hostile coast. Some people said that the opposing battleships were lying safe behind the guns and mines of Wilhelmshaven, waiting for the time when their submarine and destroyer attacks should have so reduced the numerical superiority of the British fleet as to make it worth while for the enemy to come out and fight on more or less equal terms. Others were of the opinion that the High Sea Fleet had returned to Kiel, where it was lying 'doggo,' as the saying is.

But the beauty of the whole situation was that the British main fleet had also vanished into space. It was 'somewhere in the North Sea,' if the newspapers were to be believed; but the North Sea is a very large place, and as a consequence the sallies of the German destroyers and submarines had met with no success so far as our battleships were concerned. It was a peculiar position, this species of blood-

less war; for, though the small craft on either side had come into sanguinary contact on more than one occasion, the main fleets had never been within a hundred leagues of each other. But the British public had good reason to bless the silent pressure exerted by its navy. The North Sea might well have been called the 'British Sea,' certainly not the 'German Ocean.'

And so it came about that a certain British light cruiser, which we will call the *Emerald*, found herself early one morning within twelve miles of the defended island of Norderland. Rather a hazardous position perhaps, for Norderland was studded with 12-inch guns capable of dealing with a battleship, while the little 3000-ton Britisher, built in 'nought five,' carried only twelve 4-inch quickfiring, and could not be relied upon to steam more than 'twenty-one and an onion,' as her own engineer lieutenant-commander expressed it.

The battle-cruiser lying somewhere just over the rim of the horizon, moreover, was a mastodon just eight times the *Emerald's* size. She could steam at least twenty-six knots, and was armed with ten great 11-inch and twelve 5.9-inch guns, besides an assortment of smaller weapons. It was a case of David and Goliath all over again; but the friends of the former, in this particular instance, would not have given odds of 500 to 1 on his chances of success.

The *Emerald*, however, was acting under the direct and explicit orders of the Admiralty, and her commanding officer was the only person who knew what was really happening. The others were beginning to regard themselves and their ship rather in the light of a burnt-offering; but at the back of their minds there always

lurked the idea that their vessel was only a pawn in some gigantic game of which they knew nothing, but which, at the same time, was being played for the benefit of anybody but themselves.

The dawn came in from the eastward with a rosy flush, and the paling sky overhead, streaked here and there with ragged wisps of rapidly moving mare's-tail cloud, became over-shot with the gorgeous opalescent colouring of the sunrise. It was blowing fresh from the north-eastward, and the grim gray dreariness of the sea, too disturbed to reflect the glory of the sky, was flecked with white horses. But the short, steep little waves were comparatively harmless. They did not even cause the little cruiser to pitch and roll, and only brought a curse or two to the lips of the men stationed at the guns as an occasional whiff of icy wind-flung spray hurtled across the low-lying decks like a volley of small shot. 'Christians, awake!' quoted the muffled-up figure of the lieutenant high up on the bridge. 'Thank the Lord for the daylight!'

'Why thank the Lord?' asked the first lieutenant, who, by virtue of his office and the smallness of the ship, was also the gunnery officer. 'There's not a perishin' thing in sight!' He seemed rather put out about it, and gazed round the gradually lightening horizon with disgust written on his face.

The navigator laughed. 'Cheer up, Number One!' he remarked. 'You ought to thank your lucky stars we didn't find ourselves under the guns of Norderland at daylight. I've been running on dead reckoning; and, as we've been inside the twenty-fathom line the whole way across, the lead hasn't been any earthly use at all.'

'I don't give a tinker's curse for Norderland!' retorted the other. 'What I do want is a nice little cruiser or a destroyer; something, at any rate, to ease off the guns at. The men are all grumbling that they've hardly fired 'em since the war started! The worst of you perishin' pilots, though,' he added half-seriously, 'is that you never seem to know whereabouts the ship is. Now, if I were a navigator'—

'I do know where I am on this occasion, though,' protested the officer responsible. 'That's one thing in favour of reciprocating engines, you can navigate the ship on the revolutions. I'll lay a small bet with you if you like.'

'About what?' demanded the first lieutenant suspiciously.

'That we pick up Norderland dead ahead within a quarter of an hour. Will you take me up? I'll give you two to one in half-crowns.'

'I never bet before noon,' replied Number One sanctimoniously, shaking his head. 'What's that you've got in that thermos bottle?'

'Cocoa. Have some?'

'Bet yer life.'

For some minutes there was silence while the first lieutenant drank the warm liquid. 'Thanks; that's good!' he remarked at last, handing the cup across. 'Where's the owner?'

'Down in the charthouse looking at the chart.'

'I wish he'd let us know what's happening. I can't help thinking there's something behind this show. Nobody in his sane senses would send a ship like this within twelve miles of—Hullo! here he is!' he added in a whisper, as the burly, greatcoated figure of the commander hove itself on to the bridge.

'Good-morning, Number One,' remarked the new-comer affably. 'Are your guns all ready manned, *et cetera*?'

'Yes, sir,' replied his subordinate.

'So much the better,' said the commander. 'I dare say you two would like to know what's going on, eh? I've not been able to tell you before; they wanted it kept dark.' He had heard the first lieutenant's last remark to the navigator.

'We should, sir,' they both answered at once.

The commander took them aside out of ear-shot, and talked rapidly for some minutes.

'D'you understand now why we're here?' he concluded with a smile.

'Perfectly, sir,' answered the first lieutenant, grinning all over his face. 'We're the bait, so to speak.'

'Yes, that's it,' resumed his senior. 'I am ordered to be within seven miles of Norderland by 4.30 this morning, and then we have to cruise about there at high speed for an hour, or until we're chased away. Lord help us, though, if there are any mines knocking about! We'd best be getting on,' he added; 'it's twelve minutes past four now. Shove her on at twenty knots, navigator.'

The engine-room telegraphs tinkled merrily; the *Emerald* began to move through the water; and the first lieutenant, leaving the bridge, went round his beloved guns to satisfy himself that everything was correct.

The officers and men all looked happy, supremely happy, and the sight of the little piles of ominous-looking yellow lyddite projectiles in rear of each gun only whetted their appetites. They were in for it at last, after weeks of weary waiting; and as the little cruiser steamed off in the direction of the rising sun, with the White Ensigns fluttering from her mastheads and rigging, there was not a man on board who wished himself elsewhere.

'We ain't got much money,' remarked the gunlayer of one of the midship guns, removing his eyes from the telescopic sight to superintend the ramming home of the yellow-painted projectile; 'but we do see life!'

'Let's 'ope we're goin' to, Sam,' the loading number observed, smacking the breech to behind the brass cartridge. 'We've been waitin' long enuf, an' I reckons'—

'You reckons wot?' demanded the gunlayer.
'I reckons it's just abart time we 'ad a picture
o' this 'ere ship in th' *Daily Mail*.'

The gun's crew giggled.

'Strewth, I 'ope so!' ejaculated the gunlayer
solemnly.

The navigator's reckoning was not far out,
for ten minutes later the rugged gray outline of
Norderland appeared slowly out of the slight
morning haze dead ahead. The island was about
eight miles off; and, steaming in another mile,
the *Emerald's* helm went over, and she sheered
abruptly to port.

The hostile lookouts were on the alert, for at
the same moment that the cruiser altered course
a winking light began to dance in and out, in
and out, somewhere near the summit. Its
message could not be deciphered, but there was
no mistaking its purport.

'They're asking us who the devil we are,'
muttered the commander, peering through his
glasses. 'The next item on the programme will
be a shell.'

He was perfectly correct; for, finding its
signals unanswered, the searchlight ceased its
flickering, and a moment or two later a sheet
of orange flame blazed out from one of the forts.
The island was fully fourteen thousand yards
distant, but the size of the flash showed that a
heavy gun had been fired.

Ten seconds—fifteen—thirty. Then there
came the deep-throated rumble of the discharge.
It was followed almost immediately by a gigantic
spout of spray about one thousand yards short
and well astern, and, with a whistling and a
screeching like an express train tearing through
a station, the giant projectile, clearly visible to
the naked eye, ricocheted off the water and
went sailing away through space, tumbling over
and over in its flight like a badly kicked Rugby
football.

'What infernal things they look!' remarked
the commander coolly. 'I hope to heaven one
of 'em doesn't hit us.'

'They'll have to make pretty good shooting
to get us at this range, sir,' remarked the first
lieutenant, who had returned to the bridge.
'We're over fourteen thousand, and at that
range the angle of descent is practically vertical.'

'I dare say, Number One,' the commander
agreed. 'But if they make any better shooting
I shall draw off a little and steer a zigzag course.
A single one of those would sink us outright if
it hit us and burst. The last one didn't explode,
I notice.'

Another flash from the island. Another
leaden-footed thirty seconds, and then the dull
BOOM—M of the great gun, followed by the
geyser of flung-up spray from its falling shell.

This time it came a good deal closer, barely
two hundred yards away on the starboard beam,
and, bursting on impact, the shower of knife-

edged steel slivers emerged from the dun-coloured
cloud of the detonation, and came whirring across
the water like a drove of angry hornets. They
came too close to be pleasant, far too close, for
several fragments whizzed over the bridge;
others rattled against the funnels, superstructure,
and hull like a handful of pebbles flung against
a corrugated-iron shed.

The detonation had taken place too far dis-
tant for the splinters to be really dangerous, but
for most of the *Emeralds* it was a baptism of
fire. They evinced no particular emotion, how-
ever; and now that the firing had once started
and the dreadful anticipation was over, the guns'
crews on deck merely shook themselves, looked
anxiously at each other, and then gave vent to
their bottled-up feelings in making remarks about
the enemy's gunnery.

At this stage of the proceedings the little
cruiser certainly had the luck on her side; for,
though over ten heavy shells were hurled at her,
she reached the end of her run without suffering
any casualties. Then, when the dull gray shape
of Norderland had all but disappeared in the
morning mist and the guns had ceased their
uproar, she turned on her heel to run the gaunt-
let again. Her commander was wise in his
generation, for the ship zigzagged in her course
as she went.

But for some reason the enemy's weapons did
not reopen their fire. It may have been due to
scarcity of ammunition, or perhaps the light
cruiser offered too difficult or too unworthy a
target, but at any rate the little ship was suffered
to steam on for fully ten minutes without a
round being discharged at her.

Then, quite suddenly, the mists lying on the
water to the right of the island seemed to roll
back, and the black rushing shapes of half-a-
dozen hostile destroyers became clearly sil-
houetted against the gray pall behind. They
were about six and a half miles distant—thirteen
thousand yards—but the bones in their teeth
(the white bow-waves) and the pall of black
smoke streaming horizontally behind them
showed that they were travelling at full speed.
They were steaming, moreover, directly toward
the *Emerald*.

The first lieutenant bent down with his lips
hovering over the voice-pipes communicating
with the guns. He made a rapid mental calcu-
lation. Say they were steaming at thirty knots,
a mile in two minutes. Suppose they intended
to close in to five thousand yards, and then to
fire their torpedoes. It was quite possible,
though risky for them, and it was on the cards
that the *Emerald* might be torpedoed, and the
first lieutenant had no intention of allowing
them to close in to the decisive distance.

He passed an order through the voice-pipe,
and the guns on deck slued round with their
lean muzzles pointing well into the air.

The minutes crawled, and the voice of the

range-finder operator droned monotonously; but on and on came the black rushing shapes. Then he glanced at the commander, who caught his eye and nodded; a muffled order went down the voice-pipe, and with the sharp smack of exploding cordite the first gun blazed out. It was followed in rapid succession by another, and then three more almost simultaneously. The ship quivered a little as her weapons spoke, and the guns' crews, with the joy of battle in their eyes, reloaded.

Eons of time seemed to pass before the projectiles drove home; but at last a ragged cluster of shell fountains leapt silently into the air some little distance short of the attacking flotilla, now advancing in a wedge formation, with the leader at the apex.

Another order down the voice-pipe, another ripple of fire, and then amid the spray fountains the first lieutenant caught a hasty glimpse of a bright flash and a small cloud of yellow smoke. One shell, at any rate, had gone home. He smiled to himself and passed another order.

This time it was hell let loose, for the range had been found, and the guns were fired as fast as they could be loaded and their gunlayers could lay them.

The attackers became obliterated in a spouting upheaval which lasted for nearly a minute, and then again the fire slackened. But the attack had not been beaten off yet, for three black shapes still came on.

The guns reopened, and then came another pause.

The leader of the three had stopped, her forepart a hideous shambles of twisted steel-work, and her deck swept clear of funnels, boats, masts, and guns. Down, down went her bows, and up came the stern until the rudders and propellers were clear of the water. She hung there for an instant, and then quietly settled down. Two of the others, one of them wreathed in a cloud of steam, floated motionless at impossible angles. Two more were limping shoreward as fast as their injuries would allow them. Only one appeared to be wholly undamaged.

'Shall we close in and finish 'em off, sir?' queried the first lieutenant with the mad lust of battle in his eyes. 'I'—

His words were cut short by the sullen boom of a heavy gun and an upheaval of water close to the *Emerald's* stern. The heavy report came from the south-eastward, to which quarter nobody had been paying very much attention; but now, with a hurried glance in that direction, the commander put his lips to the voice-pipe leading to the conning-tower. 'Hard a-port!' he ordered; for, looming out of the mist barely twelve thousand yards away, no great distance for an 11-inch gun, was the gray shape of a hostile battle-cruiser. She too was travelling at full speed, a speed which, if the reports were correct, had exceeded twenty-six knots on trial.

The *Emerald* could only steam twenty-one and a fraction.

The first lieutenant looked at their giant enemy, and then glanced at the commander to see how he was accepting the new situation. The latter looked perfectly calm and serene; and, profiting by his example, his subordinate grinned sheepishly; but still he could not help feeling rather nervous. He knew that the ship, to use his own expression, was only the bait, for it had been arranged that at dawn certain British submarines should be between her position and the island of Norderland. The little light cruiser, apparently unsupported, was there for the purpose of drawing the hostile leviathan to sea in chase of her, while the submarines were to attack the battle-cruiser as she came out.

But submarines had been known to go astray, and suppose they had not reached their position? That deficiency of five knots, too, was rather appalling. How was the first lieutenant to know that his commanding officer had not told him quite all of what was happening, and that, just over the rim of the horizon to seaward, say twenty miles distant, lurked a supporting force of three British battle-cruisers? They had been placed there by the originator of the scheme, a man who was not in the habit of sacrificing his light cruisers on the altar of immolation without rhyme or reason.

The young officer on the *Emerald's* bridge was painfully aware that the loss of his ship would be considered as of very little importance so long as the hostile battle-cruiser was destroyed. He was perfectly willing to sacrifice himself and all he possessed for the sake of his country; but the cold-blooded anticipation of the deed was rather dreadful.

His thoughts were suddenly cut short by another report from the chasing vessel, and this time her projectile dropped perilously close astern. It burst, and once more the splinters came whizzing through the air. This time some of them found their billet, for a moment later there was a cry for stretcher-parties; and, glancing aft, the first lieutenant saw several figures lying prone on the upper deck.

The battle-cruiser fired slowly, for her foremost turret alone would bear; but she was approaching her quarry at the rate of about one hundred and sixty-six yards a minute, and her shooting was getting accurate.

Exactly how the projectile pitched the first lieutenant never quite knew; but there suddenly came an appalling crash and a clatter from aft. He had a fleeting impression of a sheet of lurid yellowy-violet flame, a pall of thick gray smoke and black dust from a coal-bunker, and an upheaval of flying *débris*. The shell had apparently burst on striking the deck, for when the pall had cleared away the after-funnel had vanished. There was a great gaping orifice in the deck itself, while the wooden planking, torn and

riven in all directions from its steel foundation underneath, burned with a sickly yellow flame. One gun had been wrenched from its seating and hurled overboard, and more figures lying in impossible contorted attitudes showed that the great projectile had done its work only too well.

The *Emerald's* speed slackened. Flames, sparks, and volumes of dense black smoke and white high-pressure steam hovered round the orifice where the funnel had once stood, and already the tongues of orange flame were licking round the woodwork in the vicinity.

Then came a cry for fire-parties.

The first lieutenant waited no longer, but, scrambling down from the bridge, ran aft along the upper deck, shouting for men as he went. How they ever rigged the hose he never quite remembered; but after what seemed an interminable delay three jets of water were spouting on the blazing *débris*. Black figures, looking like demons capering round the crater of some spouting volcano, danced in and out of the horrible inferno of smoke, steam, and flame. The acrid fumes of the blazing wood, the bitter, sickly taste of the explosive which had wrought all the damage, and the all-pervading odour of steam and coal-dust assailed their eyes and nostrils; but they fought valiantly, pitting their puny strength against the might of the elements.

'Stick to it, men! Stick to it!' the first lieutenant found himself saying with monotonous regularity. He looked down and saw he was manipulating the branch-pipe of a fire-hose. He had seized it by instinct without being fully conscious of his action; but his thoughts, somehow, seemed far away from the fire. 'Stick to it!' It sounded so very trite and commonplace, rather as if he were encouraging a boat's crew at a regatta. He racked his brains to think of other words of encouragement, but could think of nothing.

Then came the screech and explosion of another falling shell. There was no crash this time; but a man near the officer suddenly spun round and fell to the deck. Then, somehow, his own right arm seemed suddenly to become paralysed and useless, for it dropped limply to his side. He paid no attention to it, and shifted the grasp of the hose to his left hand. Soon afterwards there was a deep reverberating B-O-O-M. The air trembled. It was certainly no gun. He heard volleys of cheers. The clouds of smoke and steam drifted to leeward on the breeze; but inch by inch, foot by foot, the fire was vanquished, until only a few spirals of flame danced in and out of the charred and blackened woodwork. A quivering haze rose from the scene of the conflagration; and, leaving his men with orders to keep their hose playing, the first lieutenant went forward to report. He glanced down at himself as he went, wondering at his scorched uniform. He looked at his left hand, blackened and blistered with the fire; and then, the excitement

over, suddenly realised that his right arm was numb. He tried to lift it, but could not, and, feeling irritated, looked down at his right hand. It was bright crimson, and ominous-looking drops were slowly falling from his fingers to the deck.

'My God!' he muttered, aghast at the sight, 'I must be wounded! Wounded! How beastly annoying!' The pain in his right shoulder became excruciating. He tried to open and shut his fingers, but without success.

He never remembered reaching the bridge; but the fact that he had a report to make had fixed itself in his mind, and he somehow found himself crawling up the steep ladder. 'The fire's out, sir! The fire's out!' he repeated mechanically, going up to the commander. 'I'm damned thirsty!' he added with a sickly smile. 'Got anything?' He swayed ominously.

'Poor devil!' he heard some one say; 'he's been hit in the shoulder.' He did not realise that he himself was being referred to, but saw the navigator run forward to assist him. Then a gray mist swam before his eyes, and he collapsed quietly to the deck.

About thirty hours later the *Emerald* steamed slowly into Sheerness harbour. She bore little resemblance to her former trim self, for her third funnel had vanished, while the after-part of the waist was a battered conglomeration of twisted steel and charred, riven woodwork. But what did it matter? The British submarines had done their work; and the hostile battle-cruiser, torpedoed close to the after-magazine, lay quietly on the bottom in nineteen fathoms of water.

The gunlayer of the *Emerald's* port midship gun had his wish gratified, for three days later a photograph of the ship appeared in the *Daily Mail*. Below it appeared two rows of heads labelled 'killed' and 'wounded.'

'Strewth!' murmured the loading number, pointing to one of the reproductions, 'that ain't arf like our old Sam!'

But poor Sam, the gunlayer, figured amongst the killed.

SONNET.

LAKE LUCERNE.

I LOVE to watch thee dimm'd by mist and rain,
At morning when perturbed to mild unrest,
Or noon-kist; but I know a dearer zest
At evening when the light begins to wane,
And o'er thy water creeps a scarlet stain
Like magic roses opening on thy breast.
Oh fading cheek by fainting lover pressed!
Oh glory that can never bloom again!

But most I love thee when the wizard night
Moves tenderly from o'er the moonlit hills,
And bathes thy bosom with a holy light,
And all thine heart with sacred silence fills;
For fancy mounts on heavenward-beating wings,
And round my life God's deathless glory flings.

Chambers's Journal

SEVENTH SERIES

A RISE IN HIS SALARY.

By KATHARINE COX.

CHAPTER I.

THE door closed behind the head-clerk's shabby back; and Skene, seated at the big writing-desk in the centre of the room, smiled grimly. Once more he had proved himself to be a man of strong and iron will, who would never allow his head to be governed by his heart, and give way to mawkishness and sentimentality. A rise in salary indeed!

It was unlike Cooper, usually the meekest of men, to have dared to suggest such a thing. But it would have been still more unlike Cooper's employer to grant the request; he rubbed his thin hands together, and an expression which was as near an approach to a smile as he ever achieved passed over his stern features. The fellow had always been perfectly satisfied hitherto. What did he want a rise for? Preposterous!

Skene remained seated at the writing-desk a little longer, carefully locking away in the drawers sundry letters and papers; then, rising, walked out of the handsomely furnished private room into the outer office. It was Saturday afternoon, a half-holiday; but though all the frivolous, idle good-for-nothings in his employ always took advantage of the—in his opinion deplorable—institution, he himself rarely did, and this afternoon he was going down to a remote village in Essex to see a rich client who was altering her will for the twentieth time!

As he had anticipated, the office was practically deserted; even Cooper—dull, bald-headed fossil of that age!—had flung down his work as soon as the clock struck two. The junior clerks and the office-boy were by this time, doubtless, staring their foolish eyes out at picture palaces. Only Miss Jenkins, the head-typist, still remained at her post. But then Miss Jenkins was always the first to come and the last to leave; he himself was not a harder worker.

Skene shot a cursory glance at her as he passed. No woman interested him, Miss Jenkins least of any; but whenever he saw her he was unable to avoid marvelling at her amazing unattractiveness. A sloppy figure wearing huge spectacles, clad in the dowdiest of garments, and with an untidy mop of grayish hair, she was a great contrast to the other typist, Miss

Carey, who was pretty, and wore low-necked blouses with a good deal of blue ribbon showing through their seductive transparency, open-work stockings, and paste ear-rings.

'You have not done yet?' Skene remarked.

Without looking up from her Remington, the dowdy typist answered, 'I have a couple of letters to finish.'

She spoke in a dull, curiously toneless voice, and Skene squirmed. That voice of Miss Jenkins always irritated him. Still, the woman was good at her work. No other stenographer of her capabilities, he knew, would slave from 9 A.M. till 6 P.M. for a pound a week; and, almost repulsive though she was, he would be a fool to part with her.

The lawyer dismissed her from his mind, and a little later, having already lunched, was in a first-class smoking compartment, with an expensive cigar between his lips—his stinginess to his employes was proverbial, but he was careful of his own comforts—and an early edition of the evening paper in his hand. The train was soon rushing through a panorama of sweet-scented hay-fields, sunny uplands, and wooded hills. The summer sunshine outside the window laughed and beckoned; but Skene heeded none of it, he was engrossed in the 'share market.' Nature, even in her loveliest garb of July, did not interest him; money did, and he noted with satisfaction that all his own investments were doing splendidly.

Skene alighted at the small wayside station where presently the train drew up. There were no cabs, of course, in a one-horse place like this; but he had expected old Miss Blair to send a carriage to meet him. However, as she was quite as selfish regarding other people's comfort as he was, she had not done so. Extremely annoyed and fuming, he set out on the three-mile trudge to Blair Court. He would make the old hag pay for this—in her bill! Not many men would have given up their half-holiday for an old maid's fads and fancies! It was such a scorching afternoon, too; and a tail-coat and silk hat, together with rather tight patent-leather boots, were not exactly ideal garments in which to tramp along the dusty highway.

The atmosphere seemed to grow sultrier, and

when at last he reached his client's house he was almost exhausted. The old lady was more than usually trying; and when, after occupying over an hour, she sent him back to the station again without offering him even a cup of tea, far less a carriage, his wrath against her increased. The walk from the station had been bad enough, but the return to it was worse. The heat was still intense; but the sky had now become overcast, and presently Skene heard an ominous muttering of thunder. Then, almost immediately afterwards, down pelted such a storm of rain as he had seldom encountered. He had no umbrella, and as long darts of forked lightning now shot across the livid sky he was afraid to shelter under a tree, and grew alarmed. He had more than a mile yet to go. What might not happen to him in such a terrific thunderstorm as this?

Glancing anxiously up and down the road, he would have welcomed even a cowshed, but there was no building of any kind in sight. What, in the name of bad fortune, was he to do?

He started running, with his hands before his face to shut out the blinding lightning, and presented by now a sorry sight. The smart silk hat was reduced to pulp; his collar hung limply round his neck; his clothes were soaked. The thunder rolled like some devilish artillery; the trees rocked and moaned; he wondered if one would fall upon him. It was quite possible that he might be killed.

Then, suddenly turning the bend in the road, Skene came upon a little insignificant house, so insignificant that he had passed it before unnoticed; a jerry-built house at which, ordinarily, he would have scoffed. He was not in the mood for scoffing at anything now. Dashing up the little front-garden path, he seized the door-knocker.

The gimcrack knocker refused to knock. Skene tugged at the bell, which refused to ring; then he beat upon the door with his hands.

Through the thin walls it was possible to hear sounds within the house. Skene heard little quick footsteps running along the passage. Then the door opened, and there stood before him a small girl of about seven or eight in a pinafore. She peeped out at him shyly and a little apprehensively, for instinctively a frown had gathered between Skene's brows; he did not like children. Then, evidently bravely choking back any nervousness which she felt, she said, with a pretty lisp, 'Do you want to see my uncle Jimmy?'

'I do not know your uncle Jimmy,' was Skene's reply; 'but what I want is temporary shelter from this storm. Will you give it to me?'

He was so unused to children that it did not strike him that his mode of expression was perhaps somewhat above his small hearer's comprehension.

However, she was an intelligent youngster, and, though at first she appeared puzzled, she presently smiled. 'Of course,' she said. 'You are afraid of catching cold! And you are dreadfully wet, as wet as my poor dolly Rosa when I fetched her in just now from the garden. Come inside and be dried.'

She turned, and Skene followed her into a small room on the right of the ugly little hall. It was a terribly small room, gimcrack from the imitation turkey carpet to the dried grasses in the cheap glass vases on the mantelpiece; and yet, somehow, it was cheerful and homelike. The hot afternoon had turned—as it so often does after a thunderstorm—into a chilly evening, and a bright fire blazed on the hearth. Before the fire, in a comfortable arm-chair, reclined a bald-headed and decidedly disreputable-looking doll; and in the fender, drying, were sundry garments of the doll at which, had they belonged to a human being, Skene would have blushed. In the centre of the table, which was laid for tea, was a bowl filled with sweet-peas; and a tabby-cat lay curled up in the window-seat.

'Now,' said the little girl—she moved to the arm-chair and lifted the doll—'you must come and sit down, please, and dry yourself. Rosa has had the chair a long time, and she mustn't be selfish.'

The selfish Rosa being transferred to the window-seat beside the cat, Skene, nothing loath, took her place. His small hostess hovered about him anxiously.

'I do hope you won't catch cold!' she cried. 'Of course it would be better if you took your things off; but then you would have to put some more on, and I'm afraid my clothes would not fit you.'

'No,' said Skene, 'I'm afraid they would not.'

'And Sarah's clothes is all locked up. Sarah's our servant, and this is her afternoon out. And Uncle Jimmy's is all locked up too, or I would get you some of his.'

'Where is your uncle Jimmy?' said Skene suddenly.

It was all very well to burst unceremoniously into an utter stranger's house, oust a young lady like Rosa from the chair which she evidently regarded as her right, and accept calmly the kindly ministrations of a child of eight; but, after all, there must be some other inhabitant of this happy little homestead besides a doll, a child, and a cat; somebody who perhaps might not welcome him so unquestioningly as his present small hostess.

'Where is, and who is, your uncle Jimmy?' Skene said rather sharply.

The child looked up. In the grown-up, almost old-womanish, manner which sat upon her so quaintly, she was in the act of filling the brown earthenware teapot on the table with boiling water from the kettle on the hob.

'Uncle Jimmy!' she echoed. Her blue eyes widened; she looked at Skene as if he had asked some question which was almost ridiculous—who the king of England was, for instance, or why cats did not bark like dogs. 'Why, I thought everybody knew my uncle Jimmy! He's—he's just the kindest, and cleverest, and most wunnerful person in the whole of the world! Oh, you don't know how clever he is! He can make old women's faces out of walnut-shells, and he can play most lovely tunes with a bit of paper over a comb! And—and—the pink of her cheeks deepened, the blue eyes glistened—'I've been so happy! I've felt like one of the princesses in the fairy story-book he reads to me since I came to live with him in this dear little house! I only came a month ago, you know—I came with Rosa. Rosa had no clothes to speak of, and, as Sarah said, I hadn't either; but Uncle Jimmy bought'—

Skene made a curious clicking noise with his tongue and his teeth, and the child instantly stopped.

'Are—are you angry with me?' she asked; and Skene, for the first time in his life, felt embarrassed. Hang it all! he had not meant to frighten the child. It was his nature to display impatience when females—he was the type that classifies all women as 'females'—chattered; but—well, she was scarcely like the

ordinary, foolish, tiresome feminine creature, this small person with the wide blue eyes and bobbing yellow curls. And she had shown him great kindness and hospitality. He forced a smile—a curious, unnatural sort of contortion, certainly; still, it rendered his stern face a trifle less forbidding than it was usually.

'My dear, of course I am not angry! Only—like all—er—females, you wander somewhat from the point. I know now *who* your uncle Jimmy is—he is the kindest, cleverest, and most wonderful man the world ever knew—eh?' he chuckled. It was a ghastly sound, as unnatural as his smile; still, it had the desired effect, for the child seemed to lose some of her recent timidity, and came a little nearer to him. 'What I have still to learn, however, is *where* he is.'

'He went out to post a letter,' said the little girl, 'before the storm came on. I 'spected him back before this, but p'raps he has stopped somewhere 'cos of the wain.' She suddenly rushed to the window with a joyous shriek: 'Oh, he's coming up the path now!'

There was the sound of a latch-key being fitted into the little jerry-built front-door, and then the door of the sitting-room opened. The child sprang forward with another joyous shout; and Skene, turning, saw her in the arms of his head-clerk, Cooper!

(Continued on page 121.)

WHERE THE POST-OFFICES OF SEVEN NATIONS COMPETED.

By DOUGLAS B. ARMSTRONG.

BY the repeal of the Turkish capitulations on 1st October 1914 the Ottoman capital is robbed of one of its most remarkable and picturesque features—the foreign post-offices. Constantinople has hitherto been unique amongst the cities of Europe in the number and variety of postal facilities that it afforded. Indeed, the sojourner in the Golden Horn suffered from an *embarras des richesses* when requiring to make use of the post-office, in the many nationalities that competed for his custom.

Not only were the services of the Imperial Ottoman post-office, with its special foreign department, at his disposal, but those also of France, Germany, Russia, Austria, Italy, and Great Britain; and since no one ever thought of entrusting his communications to the Turkish post-office, his ultimate choice would probably be determined by his nationality. In the Rue Verwoda and in the Grand Rue de Galata the imposing establishments of the foreign post-offices were encountered at almost every turn, and through them and their branches and agencies in the principal ports and commercial centres

throughout the Turkish Empire the bulk of the foreign postal business was transacted, with a resulting loss to the Ottoman revenue of over half-a-million sterling each year.

Between the hours of six in the morning and six in the evening any one could make use of these post-offices for the transaction of all classes of postal business. They were in the charge of European officials representing the postal departments of their respective Governments, and had daily arrivals and despatches of mails in sealed bags which never passed through the hands of the Ottoman post-office.

Letters had to be taken to and fetched from the offices, except the German post-office, which had a delivery service; whilst letter-boxes belonging to the Austrian agency were found in some of the principal hotels.

The rates of postage were uniformly one piastre per twenty grammes, and thirty paras for each twenty grammes additional or a fraction thereof, for letters, twenty paras for post-cards, and ten paras per fifty grammes for printed matter.

All the foreign post-offices were provided with

the contemporary postage-stamps of the home country surcharged on the face with the equivalent values for which they were sold in Turkish money. This practice was first adopted in 1884, as a result of the depreciation in the Ottoman currency, by which the exchange value of the local piastre was reduced from twopence halfpenny to twopence farthing. It was soon discovered that, on account of this difference in the rate of exchange, quantities of postage-stamps of the various nations were being purchased at a discount, and used as remittances to the home country. In order, therefore, to circumvent this illicit traffic, it was deemed expedient to place upon the stamps sold at the foreign postage agencies in Turkey some distinguishing mark which would render them invalid for use in the home country, and accordingly they had since been surcharged in the manner described. Ordinary unsurcharged stamps might, of course, be used for payment of postage at these agencies, although not on sale there. Several of the offices, however, had special issues in sterling currency for use on parcels and printed matter, on account of an arrangement with the railway and steamship companies contracting for the carriage of the mails.

The stamps of the Levant post-offices form an interesting and attractive group of issues much favoured by philatelists by reason of their political and historical associations.

There were in active operation in the Turkish Empire about one hundred and three foreign postal agencies controlled from the head post-offices in Constantinople, comprised as follows: Austrian, thirty-seven; French, twenty-four; Russian, twenty; German, eight; Italian, nine; and British, five. They owed their existence to the survival of an ancient custom, dating back to the Middle Ages, whereby each nation was privileged to maintain its own service of postal couriers to establish communication with its ambassadors, merchants, and citizens abroad, the couriers being permitted to come and go without let or hindrance through all neutral states. Those were the days when organised posts were few in number, and letters were liable to be delayed and not infrequently tampered with in transmission, particularly if they chanced to be of an official or political character; hence the necessity for the courier posts. In this way post-offices were established by the French Government in Venice in the year 1560, and subsequently in Rome (1580), Genoa (1595), Turin (1650), Geneva (1669), and in Liège (early in the eighteenth century); whilst under treaty arrangement the French postal service operated in Naples, Sicily, Sardinia, Tuscany, the Papal States, Genoa, &c.

As early as 1721 courier posts were in operation between the Russian and Austrian missions in Constantinople and their respective capitals, the couriers travelling to and from the borders of the state under an escort of janissaries furnished

by the Ottoman Government. A few years later these services commenced to accept private correspondence for transmission, and in time developed into regular public posts, and as such were freely used by the English and Dutch merchants of Constantinople. The right of the missions to maintain these courier posts was recognised by the Treaty of Kutschuk Kainardje; and under the most favoured nation clause of this and subsequent treaties, the privilege was extended to France (1812), Great Britain (1832), Greece (1834), Egypt and Germany (1870), and Italy (1873). An abortive attempt to secure a similar concession for Roumania was made in 1896. It is said that Venetian and Neapolitan sea-posts also existed early in the eighteenth century, but they have long since passed into obsolescence.

Despite the fact that reforms in the Turkish postal service had removed all actual necessity for the maintenance of these foreign offices in the interests of the mercantile community, they remained as an outward and visible sign of authority and in pursuance of treaty rights. Numerous efforts have been made by the Porte in the past to secure their abolition, and on more than one occasion the vexed question of the foreign post-offices has brought Turkey to the brink of war; but until now these efforts were without avail. When the formation of the Postal Union was first mooted, the Ottoman Government notified the Powers concerned of its intention to 'broach, develop, and sustain before the Congress the question of the suppression of the foreign postal agencies in the Empire, as constituting an anomaly derogatory to its sovereign rights and an anachronism without any actual cause.' But the Bern Convention of 1875 declared itself incompetent to deal with the question; although, by means of direct diplomatic representations, the suppression of the Greek and Egyptian offices was secured in 1881; whilst two years later the Italian service was also suspended. Meanwhile, in order to compete with the foreign post-offices, a special international branch of the Turkish post-office was organised in the business quarter of Constantinople, with an express mail service to Europe *via* Varna, but without achieving any startling result.

When the Oriental Railway linking up the Turkish capital with Europe was finally completed in 1888, instructions were issued that the mail-bags of the foreign post-offices were not to be accepted for transmission over the system, the Porte hoping in this way to destroy competition. Formal protests were, however, entered by the Ministers of the Powers, with the result that provisional permission was granted, which has since been prorogued indefinitely.

The Armenian troubles of 1895 provided excuse for a further protest against the existence of the international postal agencies, on the ground of the introduction of seditious matter into the Empire through their medium. British, French,

and German postal officials were actually placed under arrest; but the representations of the ambassadors secured their release.

Again in May 1901, when British and Austrian postal agencies were opened in Salonica in connection with the extension of the railway to that port, the foreign mail-bags were seized at the station by Turkish gendarmerie and conveyed under escort to the Ottoman post-office there. Simultaneously a note demanding the suppression of the foreign post-offices was presented to the Powers, but was returned by the Embassies; and on 16th May, Tewfik Pasha expressed regret for the incident on behalf of the Sultan, and stated that no further obstacles would be raised. During the embargo on the postal agencies, the mails were conveyed to and from the frontier in charge of special couriers.

Notwithstanding the Porte's assurances, a flat refusal was returned early in 1908 to the request for permission to reopen the Italian post-offices in Turkey, and it was only the threat of a naval demonstration in force that induced the Ottoman Government to reconsider its decision and declare that 'so long as the Italian Government only desired to open post-offices in the five towns where there already existed the post-offices of other Powers, there was no reason to adopt toward Italy different treatment from that accorded to the other Powers.' In the following year, as a step toward the complete abolition of the foreign post-offices, the Austrian Government was induced

to close nine of its post-offices established in towns where no other foreign postal agency existed.

The reorganisation of the Turkish postal service by Belgian officials in 1909 led to the reopening of the question of the postal agencies of the Powers, and as an alternative to their suppression the suggestion was put forward for their amalgamation in a single international exchange post-office; but, as usual, the negotiations proved abortive.

An interesting feature of the situation was the issue by the Ottoman post-office of special stamps for foreign postage, distinguished by the imprint of a small five-rayed star, which were sold to business houses at a discount of 20 per cent. off their face-value as an inducement to use the Turkish postal service in preference to those of the Powers. These 'rebate stamps' also entitled the sender to a formal receipt for foreign letters handed in at the native post-offices.

As usual, formal protests were entered by the ambassadors of the six nations against the repeal of the 'capitulations' announced by the Porte; but in face of the disturbed condition of European politics the suppression of the foreign post-offices has this time become *un fait accompli*. This achievement of postal independence has been commemorated by the Turkish Government imposing an Arabic overprint on the contemporary postage-stamps, signifying 'Capitulations abrogated 1330.'

THE BRIGHT EYES OF DANGER.

CHAPTER VIII.—AT THE HOUSE OF THE GARTH.

THE avenue was ill-kept and gloomy-looking. Tall trees flanked the sides, a thick and pathless undergrowth stretching under them. The arched branches overhead almost touched each other; and, although it was not nearly evening, on entering the avenue semi-darkness, as in a curtained chamber, suddenly enwrapped us. I caught a glimpse of the house now and then through the trees, and coming to a smooth carpet of grass, saw The Garth for the first time. A huge dog lying at the door rose and bayed as he heard our footsteps, and seeing his mistress, came to greet her. He sniffed at my legs. The size of the brute and his rumbling growls disquieted me.

'Poor Col!' said she. 'He is too old to do mischief; but his looks frighten strangers, the wandering tinkers, and such-like folk who sometimes come from Edinburgh. And there is never a dog that is so light a sleeper and so good a sentry as Col! If his bark is worse than his bite, it is useful sometimes in a lonely place like this.'

In truth, there was a solitary and heavy air about The Garth. There was no sign of life. Indeed, most of the windows were shuttered. The great studded door was closed, and the place

looked worse than plain; it was featureless, unless dourness, in the word of the North, be counted a feature. Many old houses seem to challenge the imagination, hinting at history, character in their architecture; the very windows of them are eyes welcoming, indifferent, or even asleep. But stillness and the shuttered windows of The Garth savoured more of death than sleep.

We crossed the lawn, and, to my surprise, the girl did not approach the big shuttered door (the main entrance to the house), but hurried to the right, and, coming to a gravelled path, halted and turned to me.

'I must ask you to wait here for a moment or two,' she said, in her speech a delightful blending of gentleness and authority. 'I take shame to say this to a guest, but it—it is necessary. I shall return immediately.'

She beckoned to the two men who had gone before, and the three left me standing where I was. My eyes followed her until she disappeared round the corner of the house. The sound of the shutting of a door came, and on the heels of it a dead silence, save for a faint and melancholy rumour, the sound of the incoming tide.

I had time to take stock of the house and surroundings. It was a plain angular building of two storeys, and, judging by the number of windows, held a goodly number of rooms. The front lay to the southward, and from where I stood I faced the west side of The Garth. One room only was unshuttered. I remember the September sun shining on it. The roof was flat, bordered by a quaint little parapet about two feet high, broken here and there by a loop-hole. A level sweep of turf fronted the house, backed by a thick coppice, and a little archway of beeches flanked it on the east. Two or three shabby outhouses behind the building, an unkempt, neglected-looking orchard with a score or so of apple-trees, a stone-built turreted dovecot, and a wooden stable made up the rest.

The silence was irksome. There was no sign of man or beast. Not a feather of smoke came from the chimneys. Had I not met the girl and her retainers I would have wagered heavily that the house was empty and deserted.

The sound of a door opening softly, and then a footstep crunching the ground, reached me. It was one of the two men. He came straight up to me and said in a silly voice, like a parrot that had its speech by heart, 'You are to come.'

'Where?' I asked him, thinking that perhaps he might let fall some crumbs of information; but all he answered, or could answer, was, 'You are to come.' There was nothing for it but to go with him. Little recking the events that hung on my going, I signalled him to show me the way, and followed him. We went round the corner at the back of the house, and the door half opened instantly on a tap from my escort. We stepped inside.

The other man (the one whom I had tossed over my shoulder) was standing behind the door. He closed and barred it instantly, and without a word the three of us went along a stone-flagged corridor. I was shown into a room at the end of it. Seated at a table was the lady of my adventure on the links. A couch was the only other piece of furniture in the room. To my astonishment, the door was locked behind me, and the men ranged themselves on either side of me, for all the world as though I had been in the dock. I was not invited to sit down, and stood in a puzzled and frowning silence. The girl's steady hazel eyes were on me from the moment I entered the room, and I saw in her face a striking change. The spark in her eyes was hard, and her lip curled.

'No doubt, while you were waiting, you were pluming yourself on your cleverness in outwitting a woman,' she began. 'That at its best is a sorry business for a man; but when he fails, then it is the woman's turn to plume herself.'

'I suppose so, madam, unless she is unlike the rest of her sex.'

I contrived a laugh, but it rang hollow, for I was nettled and mystified. Either she was a

consummate actress, bent on amusing herself for an idle hour, or there was some strange error, some affair of so urgent a gravity that she did not shrink from deception, or even force.

'He laughs best who laughs last; and I imagine, unless you are honest with me, that you may have little cause for laughter, and less time to indulge in it.'

'Little cause!' 'Less time!' I protest this is beyond my wits to understand. You charge me, I gather, with outwitting a woman.'

'Trying to outwit.'

'Let us not split threads. Outwitting or trying to, the substance of it remains, and when I laugh you threaten me with pains and penalties. To be plain with you, madam, I have suffered enough inconvenience here over a trifle for one day. If this be a jest, I am in little humour for one. If you are serious, I regret that the whole matter is as dark as night to me, and it can be but an idle and profitless course for me to stay here longer. I repeat, if I can be of the slightest service to you in this or any other matter, you may command me. Meanwhile, I am to be found at the "White Horse" in the Canongate. I have the honour to wish you good-day.'

I summoned as much dignity and control as I could, and, inwardly hot with rage and humiliation, with a bow turned to leave.

'You do not leave until I give the order,' she said, her fingers drumming the table. 'You have the makings of an excellent actor, Mr—Layton.' She spoke a couple of words in Gaelic to the two men. Pistol in hand, they put their broad backs against the door.

'In Heaven's name, madam,' I cried, 'I am not playing a part. Who is the head of this house? I demand to see him.'

'I am the head of my house.'

'Then I ask you to let me know the issue between us. I am a gentleman, and a man of honour.'

She held up an imperious little white hand. 'Spare me, I pray you! But a few minutes ago I thought so. At first I suspected your sudden rescue of the ruffian from my servants; but I listened to you, and thought I saw in your action something of chivalry. Chivalry! When a gentleman and a man of honour, as you are pleased to announce yourself, prowls round a house, and comes to the rescue of a would-be thief, he ought to have his wits about him. For example,' she said slowly, 'he should be careful to carry any important letters on his person and not in his holster.'

I stared at her in blank amazement.

'His holster!' I echoed. 'Mine is on my horse's back where I left him in the wood by the sea an hour ago.'

'I took the liberty of having it examined. Your horse is in the stables, and your papers are in my possession.'

Now all the papers I possessed were a letter

of introduction to the Writer to the Signet and perhaps a jotting of plans or notes relating to my succession to Darehope, and these I had left in my room at the 'White Horse.'

'For Heaven's sake, madam, let us get to the heart of this matter. I know of no papers that would warrant your taking the slightest passing interest in them.'

'Enough. When did you leave Bar-le-Duc?'

'Bar-le-Duc! I have never been out of England till a few days ago, when I crossed the Border. All this mystery is childish.'

She flushed angrily and rose from the table. 'Childish! Although I may be a child, if I but move my little finger you shall have reason to alter that word. Childish!' She stamped her little foot, repeating the word again and again.

'Madam, I am tired of asking pardon for unintentional offences. I meant no rudeness to yourself. Only, I am unaccustomed to this. Here I am, a prisoner, if I mistake not, and under cross-examination by a'—

'A child. Go on,' said she.

'By a lady who invites me to the hospitality of her house, and under her roof makes me a prisoner. Add to this that my holster has been rifled, and that my mind is a blank regarding the nature of my offence, and you will see that my situation is intolerable. I demand to be confronted with the head of the house, and to hear precisely the charge against me.'

'The duties of the head of the house (except the bearing of arms) are laid upon me, and I shall carry them out;' and there was beauty and courage in the poise of her small head.

'Then all I ask is that you carry out any of these duties with which you may imagine I am concerned with as little delay as possible. I am to sup with a friend in Edinburgh to-night, and have no intention of being late.'

'I think, sir, that your host will be hungry enough if he waits for you,' she said; and then, looking at me in the eyes (there was sorrow as well as anger in her own), unfolded a slip of paper. 'This was found in your holster. I shall read it, although doubtless you have its contents by heart.' She read aloud the following letter, slowly, glancing now and then at my face:

'As I am like to be delayed with the P.S.

army this by the hand of a kinsman of my own. He is starting with an advance party, and knows you by headmark and by repute. He has been told where to find you. His orders from me are that this concerns immediate affairs of State, and is to be given to no externs, but into your own hand and by himself, secretlie, and that well done this will carry credit to himself with the PS Counsels and person.

'I have discovered that the M.D.A. never reached Inverness, but of her situation, whether on the High Seas, or at the bottom, or hidden in some secret harbour, I ken nothing. But, as you are aware, the falcon-gentle is down by, and the Kestrel will no be far off, unless he is dround. This news would be meat and drink to me, if only we kent of the safety of his valise. It will be but a mornin's work for you to lure the falcon-gentle, and a word got about the K. I will be before Edinburgh in a week, if all goes as well with the P.S. cause as the late happenings warrant. To-day a great body of Atholl's men joined us, and there are promises of many more. In great haste. R.'

She read this slowly and clearly. 'Well, man of honour, what have you to say?' Words cannot convey the ice in her voice.

'Madam, what you have read may be of affairs that touch you or yours at the heart. It would seem so. But to me all this concerning kestrels, falcons-gentle, and what not is sheer bewilderment. As for the paper being found in my holster, I protest solemnly that this is the first I have seen or heard of it. To whom is the letter addressed? May I see it?' She hesitated a moment.

'I have made a copy of it. If it pleases you to play-act, you may read it again.' She tossed it on to the table contemptuously. 'The writer—I do not know his hand—is too cunning to address it or sign his name.'

There was no address, nothing on the paper but the sprawling characters of the letter and the broken seals on the back.

I read it carefully and handed it back to her.

'I know nothing whatever of the writer or the subject-matter, nor have I seen the letter before'

(Continued on page 115.)

THE RUSSIANS IN BUSINESS.

By Professor E. H. PARKER.

WITH every wish in the world to bring out the many excellent and kindly qualities of the Russians, I cannot 'qualify' them as a competent 'business' people. Perhaps concrete instances will convey to readers better than generalities some clear notion of their national defect. Several hours were wasted off Cron-

stadt before our steamer could get well into the so-called Sea Canal—that is, the narrow channel of deep water about eighteen miles long which enables steamers drawing up to twenty-six feet to pass straight up from the Cronstadt Roads to the Petrograd docks on Gutuyeff Island. Our captain was a Lett—of course a born sea-

man—and as such naturally brought up his ship in a masterly way to the one place in the wharf that was free and had been apparently destined for him by the marine authority; but, just as we were mooring, an excited Russian official shouted out that we must go higher up, and said something about ‘convenience for passports.’ Half-an-hour was wasted in crawling past one steamer and trying to creep under the stern of another; but it so happened that the space indicated was just a few feet short, and we could not even work our nose in, even supposing that the landing of passengers and baggage could have been achieved from such a cramped position. Meanwhile the excited official engaged in a discussion with the on-looking public, notably with a priest who actively interfered; and finally, amid the derisive cheers of every one both ashore and afloat, we wasted another hour in painfully warping or hauling backwards and sideways into the space originally selected by the captain.

The passport business in Russia may be useful, but it has seen its best day, and there is already talk of the Duma having succeeded in securing drastic modifications for the future. Under no circumstances can any one enter into or leave Russia without having his passport examined and stamped with a date. Moreover, so soon as ever a traveller enters an inn or lodging-house, with the intention of passing the night there, his passport is demanded by the waiter or the landlord, who at once takes it to the police. At Pskov, where I took a bedroom at 6 A.M. for washing purposes, and paid half-price on the ground that I was *not* going to sleep there, I still had to give up my passport. As a rule, the passport seems to come back from the police almost at once (no endorsement); but the landlord shows no anxiety to return it to the traveller until his bill is paid. This system, which must cost in mere clerical work all over the Empire millions sterling a year, is certainly of value in times of war like the present, for it enables the authorities to ‘place’ and trace the movements of every single foreigner or suspect in Russian dominions; but, as we now see in Britain, it is feasible at a pinch to ‘spot’ and render innocuous every dangerous character in time of war, and in times of peace and nascent popular liberty the waste of time and energy is altogether incommensurate with and out of proportion to the practical results achieved. Moreover, the working arrangements of the Russians are so fussy, excited, and slipshod that any active rogue can, in the confusion, ‘bag’ another man’s passport or pass off a false one. I myself on one occasion, at a railway junction where we were all examined, seized a Jew’s passport which looked like mine, and was making off with it openly; but, luckily for himself, and of course for me, the owner was there, and ‘stuck to it,’ or I might have lost my own.

In any case, however, the Russian officials, not only now but formerly, are and have been usually obliging—especially to Englishmen—and I have never found any difficulty in inducing either the highest or the lowest to ‘give way’ on sound reasons produced.

The changing of money in a bank is often so troublesome as to border on the ridiculous. It must, however, be confessed that scribbling formalities are common enough even in France, whilst in Bulgaria and other Slav countries there is also unnecessary fuss. Although I could easily have changed a ten-pound note at the *Crédit Lyonnais*, or at the Anglo-Russian or any other ‘foreign’ bank—or, for the matter of that, at any street Jew money-changer’s office—I thought I would try an experience at a big Russian bank at the corner of the *Morskaya* and *Nevski*. First (after removing my hat and being bowed in by two scrutinising porters) I went to desk No. 3 on the right marked *Kassa*, but was requested to ‘proceed to the desk opposite.’ Here a clerk, after eyeing me severely and asking to *see* the note, wrote down ‘95.55’ on a piece of paper, and said, ‘Please go to No. 6 opposite.’ Here three tabulated copies were made of the transaction, and I was directed to take these back again to the ‘gentleman opposite,’ who did something with a ledger, and I think gave me back one copy; but at all events said, ‘Go to No. 6 again.’ But No. 6 said I must go to No. 7 (next to No. 6), who at last gave me my money. I then asked for some small change and coppers. This request produced rather a serious and agitated conversation between Nos. 6 and 7; but, anyhow, I got them. People’s nerves are apt to get so shattered by ‘chivvings’ of this kind that spacious seats are provided in the centre of the room where they can recover equanimity. I, too, felt the strong need of a calm seat and a ‘complete rest’ in order to examine my papers, button up my pockets, and count the change without being scrutinised, and live down my emotion. At last I regained my normal calm, and actually escaped showing my passport.

On the other hand, when the Russians have clearly made up their minds as to the detailed value of any definite course of action, they rigidly adhere to it without yielding an inch to special considerations. For instance, at some hotels the hour for dining ends at 8; if you are in by 7.55 you may sit dining as long as you like; but if the clock has actually struck 8, even though you only want twenty minutes or so to consume any single dish that may be left, the waiter is rigid: ‘No; you must eat *à la carte*.’ So with your passport there arise many occasions where a little obligingness might greatly facilitate or hasten your movements. So far as *personal* readiness to oblige is concerned there is seldom any difficulty, provided you are polite and not hustling; but the average Russian

official carries out what seems to us useless forms meticulously and to the letter. When I was leaving Viborg, for instance, the railway guard shut my window and drew the curtain to prevent my looking out. I said, 'Why, I have been here a week, and have inspected the whole place on foot!' He replied, '*Pravo*'—that is, 'It is so ordained.' At 9 P.M. I was one day undressing at the same place to sleep on board a steamer starting early next morning, when a policeman looked in to say, 'All lights out at nine, even a candle, and even if you close the port-hole curtain.' This again was a case of *pravo*, or 'the law,' and I was obliged to content myself for toilet purposes with half-second flashes of a pocket electric lamp. The old story of the sentry who was discovered about twenty years ago protecting a garden rose under a verbal order of Catharine the Second does not exaggerate the Russian reverence for *pravo*. On one point the ecclesiastical authorities are wonderfully firm. On no account is a woman ever allowed to go behind the altar of a church; the lady who was with me was summarily turned back, and I was myself a witness at St Isaac's Cathedral of the state visit paid to the priests officiating by an aged lady of the distinguished Orloff family. Every one around her bowed and scraped, rushed to open doors, move aside chairs, &c.; the officiating priests kissed her, and took her behind at the side of, but not *in*, the *ikonostas*; and yet at the handsome new Cronstadt Cathedral visitors, including even foreign women, can see every particle of the interior *ikonostas* from a gallery. I always found soldiers the most obliging of men, but they never went beyond their specific orders. For some reason the half-insane Emperor Paul's cenotaph was barred off with rope in the fortress cathedral; the soldier in charge gave me full reasons for Paul's democratic popularity, but he would not let me walk past the cord that shut me off, or let me examine the inscriptions, flowers, and burning candles. A Russian colonel, hearing—it was, of course, long before the present war—that I wished to see what the interior of Sveaborg fortress was like, at once ordered a soldier to go round with me, giving him a few verbal instructions; but neither of them yielded one jot where any particular spot was barred by *pravo* or custom, even to the privileged spectator. In a word, all Russians seem kindly by nature; but if they ever get 'nasty,' it seems always to be because they resent any criticism on their ancient customs: *Nolumus leges Russiæ mutare quæ usque ad huc, &c.* I changed a second bank-note at a Russian business bank the day after war was declared, feeling sure that the paper rouble must have gone down in exchange value. One of the clerks spoke English, and he sympathetically made it his special business to get me a hundred roubles for it; four days later they would only

give ninety-five, because 'no order had been given;' yet a Jew almost next door eagerly offered a hundred.

Although Finland is part of Russia, and enormous numbers of Petrograd people are in the habit of spending week-ends or even the whole summer in *datchas*, or wooden villas, along the railway line, it is extraordinary how stupid the steamer and tourist agents are in the metropolis. The clerks of the advertised Finnish agency professed to know nothing whatever about the boats to Finland, the organised tours there, and so on. They had certain printed circulars in Russian, but they said they did not understand Finnish names, distances, or arrangements of any kind. They recommended me to write to Viborg, which I did, receiving in reply a clear English letter, together with innumerable tourist pamphlets which enabled me to travel everywhere in Finland without asking any further questions at all.

When suddenly moved to action, apparently the military and naval authorities (who have admittedly made great advances since the unfortunate Japanese war) are capable of great practical effort, as free of red-tape as possible. I was myself witness at Riga, Reval, Pskov, Staraya Russa, Novgorod, Volkhovo, Viborg, Willamstrand, and of course Petrograd itself, to the exceedingly undemonstrative but quiet, effective, and determined mobilisation efforts. Luckily for Russia, the war was from the outset not only a popular one, but passionately so. In no town or village, at no station or junction, did there seem to be any confusion on boat, train, or street. Horses by the thousand seemed to appear from every corner of the provinces concerned, and to be purchased at satisfactory prices from the peasants without friction, red-tape, or delay. Reservists, and the 'called-up' of the five or six years named in the public notices (too technical for me to understand properly), turned up at the centres named within a few hours. The home baggage of most of them consisted at first of a roll of things done up in a red handkerchief or tiny cheap valise, and about a sovereign was granted to buy more. None seemed in the least excited, still less angry or complaining; they might have been so many 'pittites' waiting for their turn at a theatre queue. Perhaps 10 or 20 per cent. were accompanied by their mothers, wives, or sisters, sometimes carrying things, as often not; occasionally children, even in arms, joined the parents; often the soldier or recruit himself carried the baby. There was no demonstration or 'gallery work' of any description by the marchers themselves. The street onlookers often cheered, uncovered, or joined in song, but the processionists did no posing; it seemed as though a whole nation had suddenly resolved to act under some supernatural and irresistible solemn command. The physique of the men

was often magnificent, usually excellent, very rarely defective. Since witnessing these moving Russian sights I have spent some weeks in Finland, Sweden, and Norway. The Swedish physique is certainly the only one to compare on equal terms with the Russian, which is far ahead of the German, French, or British in 'chest measurement,' general robustness, and sound teeth. The most formidable feature in the Russian soldier is that he needs so little; rye bread, cabbage-soup, and tea he must have, and with these he is content. Of course he will eat anything that is good; and I found, on inquiring, that he always received from one-half to three-quarters of a pound of fresh meat a day when it was possible to obtain it; that, indeed, must be counted as the essential part of the cabbage-soup. I have no doubt salt is used in the cookery; but, so far as the soldier individually is concerned, he seems willing to dispense with every luxury and submit to all other privations so long as his inner man gets the above. His kit appears to consist of a good frieze topcoat twisted diagonally into a shoulder-

and-waist sort of diagonal horse-collar, with the end of it thrust into and protected by a tin can or basin; every man carries a kettle or teapot, and perhaps the small knapsack contains a small store of emergency food. All Russians are booted, and the leather is soft; stockings are not worn, but bandage rags swathed round the feet so that the position and pressure of the cotton or hempen material on any tender spot may be varied at a moment's notice.

Like all troops, no doubt the Russians can be brutal under the excitement of active fighting; but (as I have frequently said before on the occasion of previous visits to Russia) the Russian character is kind, fraternal, gentle, and considerate at bottom; what Bismarck himself characterised as the envy, hatred, and rancour of his own countrymen's natural disposition is entirely absent, not to mention the intolerable conceit and arrogance of the Prussian 'honour,' as distinct from the comparative good-nature of the unsophisticated Bavarian, who in many respects is not unlike the Russian peasant of his own class.

IN A BACKWATER.

By Lieutenant-Colonel E. C. THWAYTES.

'**SHAIK ADAM**, have you told the *serang* that I want him to arrange to let me get a crocodile?' I asked my soldier servant on going on board the cabin boat at Quilon, a town on the south-west coast of India. The boat had been placed at my disposal to go up north along the backwater on some duty for which I had been detailed.

'Yes, sir,' replied the faithful Shaik Adam, 'I have told him. He says that he knows of a good place before we get to Cochin. The sea runs into the backwater there. On the mud banks about, several crocodiles are to be seen as the tide goes out, and the sahib will be able to get a shot at one.'

Quilon was still the headquarters of the Government of India's troops in the native state of Travancore, the most southerly of the native states of India. Formerly it had been the headquarters of a brigade, but at this time it was reduced to that of a single native infantry regiment. From Quilon small detachments were supplied to Trevandrum, the capital of Travancore; to Cochin, another native state; and to Trichur, to the north. The last was close to the railway running across India, and connecting Madras with Cannanore. Trichur and Trevandrum, the two extreme points, are connected by a backwater consisting of a series of canals joining brackish-water lakes. As there was no railway along the coast at the time, this backwater was the highway for travellers and for merchandise.

Along this coast live the Nairs, as a rule a 'light-bamboo' coloured race. Many of them are now Christians; but those who still adhere to their former faith practise polyandry. All the brothers of a family marry one wife. The wife owns the property, and her husbands work on her estate. Inheritances are vested in females, perhaps because the Nairs are not convinced of man's superiority, being true Suffragettes; and also because they may see some element of truth in the old adage that 'it is a wise child that knows its own father.'

Though the throne of the state is held by a male, the method of succession is peculiar. The reigning Maharajah's children are disinherited in favour of his sister's son; thus the succession jumps back through the female line. When the ruler is placed on the throne he is weighed against gold dust, which is made over to the Brahmins after the ceremony. The heir-apparent during the life of his predecessor is always much in evidence. The facetious called the two individuals the 'Buck' and the 'Doe' Rajahs.

'The Doe Rajah is a somewhat ponderous man,' I once innocently remarked to a friend of mine. 'I am certain that the Doe Rajah will soon come to the throne,' he replied; for he was a bit of a wag. 'The Brahmins cannot possibly get any more adipose tissue on him. Antipon might be of more use out here than its makers at present wot of. It might be of great value to those who themselves did not take it. Is not one entitled to consider one's own welfare

as well as that of one's neighbour? What a splendid advertisement that might be!

'True,' I assented; 'but then how about the patronage of the English Socialists? Might not the advertisement forfeit that?'

The cabin boat in which I travelled was quite a superior sort of affair of the type used by Europeans and native officials. These boats vary in size and accommodation, as well as in the number of rowers; though, to allow of their passage through the canals, they are never wider than about six feet. All the boats are more or less of one stereotyped pattern, for India is a conservative land. Aft of the best class of boats are two cabins, opening into one another, the smaller one directly over the counter of the boat. On the roof of these cabins meals are cooked by an ingenious device, exceeding in simplicity, and just as effective as, the elaborate paraphernalia required for the culinary contrivances designed by the Western mind. A dozen-bottle empty packing-case is filled with some sand; on it three bricks are placed to form a fireplace. Thus perfect safety of the woodwork of the boat is ensured.

The boats carry a lateen sail similar to that of Nile boats. They have very little keel, to enable them to pass over shallow parts of the backwater, and so cannot sail close up to the wind.

We shoved off from the bank, and soon started on our voyage. The *serang*, or head-boatman and captain of the craft, took up a position on one of the small seats at either side of the cabin door, and held on to the two ropes for manipulating the rudder. These ropes passed from the stern round the gunwales just below the cabin windows. From his position the *serang* was able to superintend and urge on the rowers, seated two abreast on cross-benches before him. The oars are long bamboos, tied to wooden pegs along the gunwales. For blades these have heart-shaped pieces of wood, about one foot across, spliced to their ends.

For some distance we followed a canal leading through the town. On each side were houses resembling those in Burman villages, and similarly thatched with coconut-palm leaves. Numbers of Nair boys, in evident delight, were disporting themselves in the brackish and not overclean water. On clearing the town we entered a lake, and then on through more canals and lakes.

Occasionally the scenery is extremely picturesque, and might be better appreciated if the heat were not so insufferable. Long vistas of the feathery foliage of the bamboo present waterways of exceptional beauty. Here and there plantations of coconut-trees are to be met with—useful trees, for they can supply all the wants of man. From the stems is obtained wood for dugouts and for houses, the leaves being used for the thatching of the latter; the

fruit is food; the juice of the fruit is a cooling and refreshing drink, and when fermented provides the jaded man with an antidote to forget his sorrows, though the intoxicant is not agreeable to the European palate; from the fibre is made rope; the oil is used for lighting, and for smearing over the body and the hair as a protection against mosquitoes and vermin; finally, the wood and leaves make good fuel.

We passed dugouts punted by long bamboos; also cargo-boats called *wallams*, built of long planks of wood sewn together along their edges with coconut-fibre string, presenting the appearance of gigantic canoes. Some of the *wallams* were almost entirely roofed over with arched matting of bamboo and straw, a device to protect the merchandise and to afford cabins for the crew. When the wind is favourable these craft hoist a sail of plaited grass matting or of dilapidated *gunny* or sackcloth.

We had no wind, and so could not sail. The day was fatiguing, owing to the damp, hot atmosphere of the backwater. The boatmen rowed, chanting a monotonous repetition in a minor key to help them to keep together. At first their chant was not altogether pleasant. Though I did not know Malayalam, the language in which they sang, the chant seemed to form itself into some nonsensical jingle; but as it continued it produced a feeling of desperation such as Mark Twain's 'Punch, brothers; punch.' Heavens! the thing was worse than rag-time.

As the sun got lower, I climbed up to the roof of the cabin by the movable steps at the side of the door. Here in a deck-chair I sat, and longed for some excitement to relieve the tedium of the day. At last my longing was gratified. My soldier servant told me that we were near the place where the crocodiles were to be found.

We arrived close to the Promised Land, mud banks within an inlet of the sea. All the oars, with the exception of one on each side to enable the captain to steer, were shipped. We drifted with the tide, just then running out.

On a long, exposed bank, about six or eight feet wide, lay a thing that looked like a stranded log of wood, half in the water and half on shore. By skilful manipulation the boat was got into such a position that the current would carry it past within thirty or forty feet of the object. Absolute silence was preserved, for crocodiles have very acute hearing. We drifted on. When just opposite I fired. The beast gave a quiver, and remained as it was without sliding back into the water. The shot was a lucky one, for it had hit the crocodile just above the junction of the jaws and paralysed the spinal cord.

'Wah! wah!' chorused the excited boatmen with admiration and delight.

The country native is a sportsman. The men's joy was extravagant. It was prompted

not only by a sporting instinct, but also by a thought of the *buksheesh* they might get.

At once all the oars were out. We made rapidly for the mud bank where lay the motionless reptile. No sooner did we touch ground than the boatmen in the forepart of the boat abandoned their oars, leaped out, and eagerly secured the prize; then it was hauled on board and stowed in the well of the boat, under the cross-benches, and we soon got back to our course.

As if in congratulation of the lucky shot, a favourable breeze sprang up. Before us was a large lake, into which the canal opened. We put up our sail.

All the oars were shipped with the exception of a few left trailing in the water. The boatmen perched themselves along the sides of the boat and on the cross-benches. Many commenced to chew betel-nut. A *chillim*, or native pipe, was handed around from man to man to enable all to have a long pull at the soothing narcotic. Occasionally from the well of the boat there beamed up on me a dusky face wreathed in a self-satisfied smile, while every now and then a remark would pass as to the *buksheesh* so near of realisation.

Harmony and happiness reigned universally on board. All went merry as a marriage bell, while the boat slipped peacefully through the water after the turmoil of the rowing and the heat of the day. It was evening; the sun was about to set. I looked on the vast extent of water around me. The water and the sky were tinged with soft and delicate tones.

I turned my eyes from the beauty of our surroundings, and looked into the well of the boat. Was it possible that the upper jaw of the reptile was beginning to lift slightly, or was I dreaming? No, it was so, and the movement of the jaw became more pronounced. One of the boatmen saw it too, and began to communicate his fears to his companions. The upper jaw of the crocodile rose slightly higher than it had done before. The crew all tucked up their legs and glared down in consternation at the creature. The crocodile gave a very decided yawn. Like a shot, over the sides of the boat went all the

boatmen, clinging to the gunwales. The *serang* suddenly appeared on top of the cabin with the steering-ropes in his hand, and squatted beside me.

The crocodile now began to manifest a desire to explore the boat.

'Shoot, sahib! shoot!' yelled the crew, as they were being dragged along on each side of the boat like a lot of dusky water-nymphs. My soldier servant placed my loaded rifle in my hands. On this tropical lake I had suddenly been transformed into a rival of Neptune, riding behind some monster of the deep and escorted by a band of mermen; but, instead of a crown and trident, I was provided with a solar topee and an express rifle.

'Shoot, sahib! shoot!' called my soldier servant, his voice rising above the general hubbub.

'How can I, you owl?' I replied. 'If I do I may make a hole in the boat and we shall all go to the bottom, with the crocodile in the middle of us.'

After some difficulty I persuaded the *serang* to induce two of the bravest of his crew to come on board and belabour the reptile with their bamboo oars. The example of the two heroes was followed by others, and the well of the boat presented the appearance of a lot of men trying to beat out a fire.

The treatment proved efficacious, and the crocodile was once more reduced to a state of somnolence.

We went on happily, still sailing across the lake. Again the crocodile manifested signs of returning vitality, and the bamboos were once more in use. The men wanted to throw the creature overboard. I objected, as I wanted to take it to Cochin and have it stuffed as a proof of my prowess. Finally they tied it all round with rope, like a mummy, placed it well forward in the boat, put boards over it, and detailed two of their comrades to sit on them. Thus we arrived at Cochin. On our removing the crocodile from the boat it was not dead.

A crocodile's life gives many a flicker before it is extinguished, for it has more lives than the proverbial cat.

THE ROOFS OF OUR HOUSES.

NATURE could hardly have provided a material more admirably suited for making roofs than slate. Yet mankind was slow to appreciate this, for there appears to be no record of its employment for that purpose until the thirteenth and fourteenth centuries, when it was used in roofing some of the castles built by Edward the First in North Wales. Nevertheless, slated roofs were rare until the Elizabethan period, the Cornish deposits in the neighbourhood of

Tintagel then first attaining a well-deserved popularity.

Nowadays the vast majority of roofing-slates used in, and exported from, the British Isles are obtained from the inexhaustible supplies of North Wales, of which the systematic development dates from the end of the eighteenth century. Over ten thousand men are now employed in quarrying and preparing for market these blue-gray or purple slates so familiar to every one.

Slate has much the same composition as clay, but has become hardened, and then by intense lateral pressure has acquired its characteristic tendency to split into thin plates. Thus the planes along which splitting so easily occurs do not necessarily correspond with the stratification of the clay as it was originally laid down; in fact, it is unusual for them to do so. However, various rocks which do split easily along the bedding-planes are used for roofing purposes in some districts, and are hence misnamed slates.

True slate is worked on a smaller scale in a few other localities in the British Isles besides those above mentioned, notably the English Lake District, Devon, and Somerset, Argyllshire, and the Irish counties Tipperary and Cork. Nearly twenty thousand tons of roofing-slate are annually exported from the British Isles, mainly to Germany, Australia, and Denmark. On the other hand, a somewhat larger quantity of the cheaper grades is imported, mostly from France, the United States of America, and Portugal.

In addition to roofing purposes, slate is also used in the form of slabs for making billiard-tables, cisterns, writing-slates, electrical apparatus, mantelpieces, &c. For the last-mentioned purpose it is frequently enamelled in various colours, remarkably good imitations of marble being produced in this way.

Permission to look over the chief workings in North Wales is easily obtained; indeed, some of the larger quarries maintain an official guide for the benefit of visitors. Slate is usually quarried according to the gallery system; that is to say, terraces are cut out of the hillside at regular intervals one above the other, each terrace forming a vantage-ground from which the adjacent rock-face may be worked. At Llanberis fourteen of these terraces may be counted rising from the shore of Llyn Peris, each being seventy-five feet above that next below it. The terraces are connected by inclined planes, up and down which the slates and quarry débris are hauled in small trucks by means of winding-gear. Where a large amount of worthless rock overlies the slate, the latter is often more economically obtained by running galleries into the valuable bed, the workings being thus underground, as is the case in the Festiniog district.

Blocks of slate are first loosened from the rock-face by means of explosives. At the Llanberis quarries this operation takes place at the commencement of each hour, when a hooter instructs the quarrymen to light their fuses. Three minutes later a second warning bids them seek shelter in the substantially built stone huts provided for the purpose. During the next few minutes the succession of reports familiar to tourists 'doing' Snowdon echoes across the valleys as the several charges explode, whilst a final hoot five minutes after the second marks the

conclusion of blasting operations for the hour. The large blocks obtained by blasting are split up by means of chisels into smaller ones, the quarryman's skill being exercised in taking advantage of the tendency of the block to split in certain directions, so that he may obtain pieces of useful size with the minimum of waste. The useful pieces are then packed on trucks, and when sufficient of the latter are filled the train is hauled along a narrow-gauge tramway to the splitting-sheds by a diminutive locomotive. Here the splitter sets a block on end before him, and, using a mallet, drives a thin chisel into it in two or three places along the line where it is to be split. Into the chink thus formed two chisels are inserted and worked backward and forward until the block splits in half. Each of the two pieces is treated in the same way until slates of the required thickness are obtained. The splitter estimates this thickness with extreme exactitude by eye alone. The next operation is to trim the edges of the rough slates. Machines for doing this part of the work are commonly in use; but many slates are still trimmed by hand with an instrument somewhat like a butcher's meat-chopper, but longer. The finished slates are sorted out into sizes and grades, and then carried by the narrow-gauge tramway to the port of shipment.

Visitors to a slate-quarrying district cannot fail to be struck by the immense heaps of débris around the workings. Since for every ton of slates produced several tons of useless rock must, as a rule, be removed, many attempts have been made to find a use for this débris, but so far without much success. Some of the material is suitable for building purposes, and is often so used locally, but is not of sufficient value to bear the cost of transport by rail.

The production of slate in the United Kingdom has shown a slight falling off in recent years, but it is still larger than that of any other country. In 1912 the figures were three hundred and eighty-three thousand four hundred and twenty-two tons, valued at nine hundred and seventy-two thousand and twenty-two pounds. North Wales was responsible for more than three-fourths of this total. The only other countries at present producing large supplies are France, the United States of America, and Portugal. Smaller quantities are obtained from Belgium, Germany, Norway, India, Canada, and Newfoundland. In the country last mentioned immense deposits of excellent quality occur, and since these are particularly well situated for shipment, there is every reason to hope that the oldest of British colonies will in time take its place among the world's great slate-producing countries.

Stonesfield slate, for roofing purposes, has been known for hundreds of years all over Oxfordshire, and beyond. These slates, with substantial timber to support their weight, oak laths to hang them upon, oak pins to attach them,

and good mortar beneath them, will cover a roof successfully and comfortably beyond an average lifetime at least. Such roofs harmonise well with the country in which they are used for the homes of either the wealthy or the poor. In a great hailstorm which visited north Oxfordshire about sixty years ago, the roofs covered with blue slates were ground to powder. The present writer knew a householder who denuded his house of Stonesfield slate and covered it with the common blue variety; in about two years he removed this last, and again covered the roof with the familiar gray stones which more perfectly shut out heat or cold, rain or hail. No other roof is easier to attend to in the way of small repairs. A little daub of good mortar will often hold a few of these slates in position for half a century.

Stonesfield, where these slates are quarried, has a population of about five hundred, and is seventy-one miles distant from London, and three and a half miles from Handborough railway station on the Great Western Railway. The stones are won by mining; and strenuous, besailing, uncomfortable, and dangerous work this is, to get them from below the water-bearing strata. There is, however, no danger from flooding, as there are no strong streams and no large pockets of water in the water-bearing strata at Stonesfield, and the slate-bearing rock is very porous. A circular shaft is sunk from the surface to the slate-stone level. From this shaft or pit passages are hewn in this and that direction, until the face is too far away from the bottom of the shaft to make it desirable or profitable to go farther. The stones are quarried in masses of all shapes and sizes, wheeled to the bottom of the shaft, and drawn to the surface by a windlass. When brought to the surface the stones are full of moisture, and if they are ever to be useful as slates this moisture must be frozen in them, for if it is once dried out of them by sun or wind the stones are useless for slate-making purposes. Therefore the stones are usually covered with straw, which is lifted off and on according to the weather. The uncovering and covering of the stones is a serious matter, entailing close

attention. If dug in winter, during frosty weather, they are at once spread in the open air, and by being frozen receive the needful rending or shattering process. Once frozen, they can be laid aside anywhere and anyhow. The making of the stones into slates is now an easy process. On being tapped at the proper points with a wedge-shaped hammer they quickly split into sheets of stone of the desired thickness, as their natural formation is in flakes or layers of about a third of an inch in thickness.

After the rending of the stones come the making and holing of the slates. Sitting upon a bag of straw, his legs thrown wide apart, the workman, shielded from the wind by straw-covered hurdles, takes the sheets of stone in one hand, while with the other he chops and hammers them into the desired shape and size. Then comes the process of making the hole to hold the wooden peg or nail by which they will one day be hung on to the roof-timbers of some building. When the weather is fine and the air is warm this making of the slates is a pleasant enough occupation. It is usually carried on in the summer, as it could not be done out of doors when it is very cold.

Many years ago, when walking between the hamlet of Fawler and the village of Stonesfield, we listened to the musical *click, click* of nine or ten slate-makers' hammers all working at the same time. Mountains of chippings arose in the fields by the roadside in those days, since for every slate made into saleable shape there is a little pile of refuse. This was when the digging of the stones and making of them into slates was a considerable industry, the inhabitants of Stonesfield being principally employed in the slate-pits. Times have changed, for the blue slates from Wales have come in, which can be laid on lighter timber; and galvanised iron, which can be used with little timber, has done much to damage and diminish the slate-making industry of Stonesfield. But many more slates might still have been made had it not been for emigration and the call of Australia, Canada, and South Africa, which have had a tendency to send up the price of this old roofing material.

IMPRESSIONS OF TRAVEL IN PORTUGUESE EAST AFRICA.

By G. E. ARCHER RUSSELL.

IT is high noon on one of those sweltering hot days which herald the coming of the monsoon. The unsheltered *avenidas* or streets of Lorenzo Marques, deserted save for one or two languorous natives, blink as molten metal under the fierce glare of the African sun. The heat is intense. Except in the cafés, business is at a standstill; from noon until late afternoon all

Lorenzo Marques, sensual and dissolute, will recline at ease, smoking and assuaging its incessant thirst with copious draughts of wine. Toward evening it will wake up and go about its business, but not for long; at seven it will rest again. In East Africa the spirit of enterprise is about as dead, comparatively speaking, as the morals of its people are corrupt.

Journeying east from Komati Poort, the border station of the eastern Transvaal, I had a day or two before crossing Portuguese East Africa from west to east. On the shores of the Indian Ocean, in Delagoa Bay, I came to Lorenzo Marques, its capital and chief port of entry.

In some respects I could not have hit upon the capital at a more opportune time. The echoes of revolution—that which deposed Manuel from his throne and established republicanism in Portugal—had not yet died away. At every street corner, save during the burning heat of noonday, lounged groups of little gray-coated gendarmes. These were the men of the new republic, hurried from Lisbon ostensibly to safeguard the possibility of aggression from without, but really to quell any disturbances that might arise from within the town; for it was well known that the East African Portuguese were loyalists almost to a man. But for every blue-coated royalist gendarme there were three gray-coated republicans; so, while the loyalists entertained little or no sympathy for the new régime, they were sensible to maintain a stoical reserve, careful that their feelings remained unvoiced.

I stayed a week in Lorenzo Marques, and saw and learnt many things. In the centre of the town is a *plaza*, or public square, and clustered around it are many cafés. Lit by brilliant electric arc lamps, and fantastically paved with cobbles coloured black, white, and blue, it is the pivot round which the *élite* of the town nightly meet and revel, stirred into raptures of delight by the clashing spasms of a Portuguese band.

When Sunday came I must needs follow in the wake of other folk. I went by train to Polano Beach, the holiday-resort of the town, some five or six miles down the bay. Arrived there, I found the beach crowded with Portuguese, civil and military, many as ebony-hued as the natives whom they have for four long centuries vainly pretended to govern. Mingling with the crowd, I was soon in trouble. Resenting the jostling attitude of a man whom I took to be a full-blooded negro, but who, I later ascertained, was a captain of gendarmes and a member of a family of high social standing in East Africa, I evaded arrest by the merest fluke. A few hurried ejaculations by my kind captain, and my guilt was proved. I had insulted him, so the crowd began to clamour for a posse of gendarmes to effect my capture. Realising that my sole chance of avoiding a night's lodging in a filthy Portuguese cell was ignominious retreat, I dodged away, and sought refuge at my hotel in the town.

One day I visited the market-place. It is a large, quaint old building situated in the heart of the town, where, moving among the heterogeneous crowd of traffickers and delving into the wares, I found many things to interest me. My visit, however, was of brief duration; the

place reeked with an effluxion of many odours too powerful for words. Garlic and Limburg cheese would pale beside the pungent aromas of the Mercado (Municipal) do Lorenzo Marques.

Who has not visited Lorenzo Marques and pronounced upon the peculiar currency of the Portuguese? To post a letter to, say, England costs twenty-five reis, and yet the charge is no more than the *vice versa* postage in England, where the fee is twopence halfpenny, and twopence halfpenny is more than twenty-five reis. I early experienced my first deal in reis. Wanting a cheap topee, I walked into a shop, selected one of the many shown me, and inquired the price. 'Ze prise, zar,' the little Portuguese shop-tender answered, 'iz three thousand five hundred reis.' 'Three thousand five hundred! Surely you have made a mistake,' I answered. 'No, zar, I make no meestake, zar; that iz ze prise; but I zee you do not understand ze reis, zar. Ze prise in English money, zar, is fourteen shillings and seepence.' I paid him the sum in English coin, which he seemed more pleased to have than the three thousand five hundred reis.

Down the main *avenidas*, or streets, and out to the principal urban sites, notably Reuben Point and Bombada, runs a fairly efficient electric-car service. It is the one modern feature, if we except the harbour, quay, and the train service between it and the Transvaal—built mainly by Englishmen—in the whole of Lorenzo Marques.

Northward of Lorenzo Marques five hundred miles, on a dreary sand waste at the mouth of the Pungwe and Busi rivers, is Beira, the cess-pool of the East African coast. With sand, fever, heat, whisky, beer, and sore eyes for its chief commodities, and shameless immorality the dominant feature of its life, it is of all places in South Africa the most unhealthy, the most unholy. Its thoroughfares, ankle-deep in hot, glaring, ever-shifting sand, wherein wheeled traffic is impossible, are only apologies for streets; its buildings, in the main galvanised iron shanties, would disgrace any up-country mining-camp in Australia. With little or no vegetation, and certainly no grass, and but few trees to break the monotony, it is a scene pitiful in its utter wretchedness. Guarding the sea-front at Beira, the whole length of the town, is a heavy stone wall. It has been put there to check the inroads of the tide, for Beira is little higher than the level of the sea. Take the wall away, and the town would probably be swept bare by the first high tide. If Beira is to remain Portuguese, it were better that the wall had never been built. To walk in or about the town would be well-nigh impossible were it not that cemented paths have been laid along the main thoroughfares. But people seldom walk in Beira; push-trolleys to seat two, run on miniature tram-lines, provide the popular mode of progression. And this is Beira, the port of entry, and the starting-place of the Beira-Mashonaland railway to Rhodesia. But

Beira is Portuguese—and Portuguese, too, by a strange anomaly, by the blessing of Britain—and so long as it remains Portuguese so long will the Beira of to-morrow be as the Beira of to-day. What else shall I say of Beira? This will I say: adjust it to the Union of South Africa, or to Rhodesia, and the town would be knocked into decency in less than a month.

Lying at the mouth of the Chinde River, the main outlet of the Zambesi, a day's steaming north of Beira, is the port of Chinde. With the settlement—it cannot be called a town—a mere cluster of tin shanties half-buried in the sand of the surrounding delta, is presented a picture truly typical of things Portuguese. Chinde is decrepitude itself. Were it not that it boasts a British concession—the entrepôt for Nyasaland, whence steamers ply up the Chinde and Zambesi rivers to the Shiré—it had been buried long since. Would you visit with me the most interesting corner of Chinde? Down by the river-bank it lies, a little plot of ground consecrated to God and the dear departed. Here, with the sweeping river threatening their repose, lie the mortal remains of John Buchanan, Monteith Fotheringham, and Lieutenant Stairs, martyrs all to the advancement of geographical knowledge and Christian civilisation. What does the world know of these?

Steaming up an umbrageous, surf-lined coast, we anchored a few days later in the offing by the historic old town of Mozambique. Notable in many ways is Mozambique, the only stronghold in all their East African possessions which the Portuguese have been able to retain uninterruptedly during their occupation. Situated on one of three small coral islands lying some three miles from the mainland, and founded in 1508, it was for many years the capital of Portugal's East African dependencies, and an important centre of trade and commerce. Of late years, however, its trade and importance have diminished considerably, and signs of wasting decay are now on every hand. Dominating the harbour is the castle or fort of San Sebastian; and its walls, towering seventy feet above the water-line, form probably the most remarkable and certainly the most interesting point of attraction on the East African coast. Built between the years 1508–11, of stone imported from Portugal, its very massiveness and solidity provide a striking monument to the extraordinary spirit of energy and enterprise which pervaded the Portuguese of the sixteenth century. National sentiment must indeed be moribund in a nation which can look upon San Sebastian and yet not be moved to higher aims than it would seem to cherish to-day. Probably no town in Africa has altered so little in recent centuries as Mozambique. Houses built three or four centuries ago still remain, their doors and windows, heavily bolted and barred, testifying to their antiquity.

In common with the opinion expressed by

most writers—and many eminent ones at that—I cannot congratulate the Portuguese on their rule in East Africa. Although the Portuguese were the first Europeans to settle on the east coast, and have been in occupation for over four centuries, the country lies to-day in much the same condition as when Diaz first trod its shores. That the East African Portuguese are weak-kneed and unprogressive is everywhere apparent; for, while great portions of their country show adaptability for intense cultivation and unbounded resources of immense commercial and industrial value, feeble and ineffectual attempts only have been made to gather or cultivate. Rubber, sugar, coffee, maize, rice, cotton, and tea could all be profitably cultivated, and with a minimum of labour, over wide portions of both its provinces—Mozambique and Zambesia. Yet after four centuries of occupation the country remains to a large extent virgin, and to the outside world practically unknown. Enterprise, commerce, industry—these things are languishing or are dead; retrogression, corruption, degradation—these are rife in Portuguese East Africa. And what can be said of their East African can be said with equal force of their West African possessions. Both territories are maladministered; in West Africa a system of forced labour, little short of slavery, is purging the country of its greatest asset—its native population. In both territories, too, there are vast tracts of country and immense natural resources lying idle, unutilised, undeveloped. They will remain so, I fear, so long as Portuguese rule remains.

ATTILA.

SWIFT the flaming wings of death
Beat against the labouring breath,
Blazing hearth and anguished cry
Smite against the tranquil sky,
As the legions thunder by.
For the ruthless, tragic beat
Of those fierce, relentless feet,
Broken faith, and tarnished sword,
Judgment, and not mercy, Lord!

While upon the fields of red,
Sleep the unremembered dead,
While the homeless, in the glare
Of the ruins burnt and bare,
Face a hell of black despair,
For those silent heaps that lie
Witness to a silent sky,
Shattered homes, dishonoured sword,
Judgment, and not mercy, Lord!

But when stands the naked soul,
Shamed and broken, at the goal,
When the tragic eyes can see,
Through that cloud of infamy,
Nothing but itself—and Thee,
Love invincible shall plead,
Hopeless anguish, deepest need.
Pity sheathe the flaming sword,
Mercy, and not judgment, Lord.

G. R. GLASGOW.

Chambers's Journal

SEVENTH SERIES

SONS OF HAM.

HOW many of those whose interest in South Africa is confined to the receiving or passing of dividends, or to subscribing to missions for the heathen, understand, or even expend a thought in trying to understand, the part which the black man plays in the economy of the great subcontinent? It is to be feared that many missionary addresses experience the fate of tales that are told, and that when the purse-strings of the investor are again drawn tight his only interest is a matter of principal! And yet for the latter the native forms one of the greatest assets which South Africa possesses; while in how far the former is enabled to justify his investment by results is a matter between his conscience and his God.

It is a truism, of course, to state that the natives of South Africa can be understood and appreciated only by those with the opportunity of directing them at their work and observing them during their leisure; and it is with a view towards endeavouring to render them less of an abstraction to those living far from their *milieu* that this article is designed.

Both in races and in numbers the native's name is legion. Each race has its own language, or at least *patois*; while some of the tongues differ as greatly as does French from German. Each has its own characteristics, peculiarities, and habits. To ordinary eyes a gathering of representatives of, say, a dozen different nations or tribes would appear but a mass of black faces no more dissimilar than peas in a pod, while the experienced observer would distinguish and name each by headmark. This ability is very necessary, for your native has his pride, and a very abiding pride, too; and he has nothing but contemptuous pity for the white man who assigns him to a tribe the members of which he would probably not permit to brush his boots, if he wore such cumbrous things! To hear a Zulu, for instance, speak of any other native race would make you think he was referring to something very low down indeed in the scale of creation. To him all others are Kafirs—dogs.

As in so many other connections in man's varied experiences, the ability properly to work, otherwise treat, the native is a matter of individuality—that is, a gift; for not to every one is given the necessary temperament, the judicious tact, the requisite firmness, the sympathy which

is half pity, the justice which is wholly wisdom. It is ever well to remember that the African negro is half a savage and half a child, and in this dual presentation should be treated as such. It is when the white man forgets the child in the savage, or *vice versa*, that he fails; for if the black man is quick to recognise his true master, he is no less sensitive to the blustering, heavy-handed bully or the slack, sentimental incompetent. As a reader of character, after his own fashion, he assuredly occupies no mean place, and the prestige of the white race—including as it does the preservation of a just dominance and the strict keeping of faith—should never be forgotten by those having to deal with him. It will, indeed, be a poor day for South Africa when, for the native, the word of the white man has ceased to be his bond.

While, of course, in the towns of the subcontinent natives are to be found filling all sorts of menial positions, from house 'boys' (taking the place of white servants) down through warehouses, shops, restaurants, bars, workshops, to labouring and scavenging, it is on the mines of the Witwatersrand, on the great gold-reef stretching for thirty miles to the east and west of Johannesburg, that their services are most in demand. There they are to be counted by tens of thousands, the whites representing but a mere handful in comparison; and there representatives of nearly every tribe whose kraals are to be found within a radius of a thousand miles are to be seen. There the lordly Zulu looks down with an air of conscious superiority upon the lanky, spindle-shanked Shangaan, the pork-devouring, dress-loving 'Mnyambane, the crafty Fingoe, the insolent, pipe-smoking Xosa, the scar-faced Baca, the warlike Swazi, the self-centred Basuto, the humble, red-blanketed Tembu, the noisy Zambesi, and many others whom it boots not to mention here.

For purposes of distinction, natives on the mines are divided into surface and mine 'boys' (all natives are called 'boys' in Africa); for some, principally those coming from Cape Colony, refuse to work underground, and are employed on the surface in various capacities, as, for instance, in the different workshops—blacksmiths', fitters', carpenters', engine-rooms, &c.—the cyanide-works, the battery, or on the great dumps, those miniature hills of white residual sands from which the gold has been extracted,

and which yearly become a greater problem as regards what to do with them.

The mine 'boys' proper, acting of course under the supervision of the white miners, work the air-driven rock-drills, or, where these are not applicable, with hammer and hand-drill drive blasting-holes into the reef which is subsequently to be brought crashing down through the mighty power of dynamite or gelatine. Others shovel this shattered mass of gold-bearing rock into tiny trucks, which others push along rails leading to great box-receptacles, whence the rock is conveyed by swift traction to the surface, there to be crushed under the huge stamps which roar day in and day out, making the battery, or mill, a pandemonium in which no human voice can be heard.

It will thus become apparent to the investing reader that the African native plays no small part in the work, the results of which, if the gods are good, are dividends which he never sees, but which go to enrich many with no other stake whatever in the country whence they are extracted.

Viewed from the social standpoint, the native is not less interesting. On the mines of the Rand the 'compound system,' in the strict interpretation of the term, is not practised; for, while on the great diamond-fields of Kimberley the mine 'boys' are marched to and from their work under an armed guard, and during their leisure are strictly immured within the confines of the compound, their brethren of the Rand enjoy a far greater liberty. Here, the day's task over, they are free to come and go as they please, visiting the various Kafir stores in the neighbourhood of the mines, sitting in eagerly voluble groups on some stretch of sun-parched grass, or even making calls on friends on adjacent properties. Incidentally it may be noted that, on occasion, these visits may form the nuclei of serious inter-compound fights, when, weapons of all sorts in hand—assegais, knobkerries, pick-handles, iron jumpers, bricks, stones, broken bottles, &c.—and roaring their war-songs, the 'boys' of two neighbouring mines will approach in their hundreds to wage grim battle unless the white man's authority is exercised in time. For the Kafir these are still 'the days when the angry blow resents the word that chides,' and the cause of one becomes the cause of all. There is a certain chivalry in this, for brother will fight against brother for the honour of his compound, and badly broken heads, and worse, are invariably the result of these encounters. As manager of one of the largest compounds on the Rand, the writer has seen something in this connection; and, while not impugning the individual bravery of members of other nations, he has no hesitation in saying that with fifty picked Zulus he would face five hundred of any other native race, and indeed has had occasion to do so. For grim, purposeful, concentrated action, as compared with

the wilder tactics of other tribes, the Zulus have no equal.

The compound or temporary home of the native while at work on the mines, and many hundreds of miles from his much-loved *kaya*, is usually a huge hollow square or oblong, the sides of which are composed of the whitewashed, corrugated, low iron 'huts' or sleeping-places wherein, on deep double-banked shelves, the inmates repose transversely. The cook-house, with its great iron cauldrons in which the mealie-pap is prepared, usually occupies the centre of the square, and some idea of the work which goes on here may be gathered from the fact that, when a compound manager, the writer required twenty bags of ground mealie meal per day for the 'boys' under his charge. At that time—before the great Boer war—meat was only allowed once a week, and every Saturday four bullocks were slaughtered to provide the necessary supply. The capacity of the native for beef is something to marvel at, and those with purses commensurate with their appetites were of course free to purchase what they pleased at the various Kafir stores. There weird scenes are frequently enacted, and it is no unusual thing to see dusky gourmets squatted on the floor devouring alternately sardines and lumps of bread dipped in tins of golden syrup! These stores are regular little universal providers of native wants, and form very lucrative holdings for those having permits to conduct them on mining properties. As may be imagined, however, the trade is not a particularly nice one, and the actual dealings with their customers are usually in the hands of low-class Jews. This also applies to the still more disagreeable Kafir eating-house *per se*.

The natives are nothing if not clannish, and in the compound each nation keeps strictly to its own huts. From each, one or two *indunas*, or leaders, are selected by the compound manager to act as spokesmen or police, and generally to look after the interests of their tribesmen; also to arouse them when the whistle blows for work on the morning or night shifts, and marshal them in long queues on pay-days, or when work-tickets are being initialled by the timekeeper.

The writer's experience is that mine natives especially are essentially cleanly, so far as their bodies are concerned, washing their teeth after every meal and their persons after returning from work; and in his compound, as in others, an enormous bath was provided in which they disported themselves to their hearts' and bodies' content. Their leisure, as they sit in the sun before their huts, is employed in the pretty and often artistic ornamentation of knobkerries, sticks, snuff-boxes, &c., in wirework, the polishing of sjamboks, or in playing their own peculiar games of chance, one of which at least has successfully defied the white man's understanding. Instruments, more or less musical, in which the concertina is prominent, appeal to the tastes of

others ; but it is a curious fact that, although he possesses a wonderful ear for 'time' and can contribute towards part-song or chorus in perfect unison, the Kafir is almost in no instance a musician. Exhibitions of the war-dances of the various tribes are usually reserved for Sundays, when, hair frizzed and gleaming, like their bodies, with oil, actual deeds of valour against enemies are recounted in pantomime by excited warriors to the accompaniment of yells of approval or deep-toned chorus, what time the ground literally shakes to the stamp, stamp of naked feet. The manufacture of a pungent snuff, of which some are inordinately fond, is another employment of leisure ; while on occasion the baleful witch-doctor, with his weird and nameless collection of 'charms,' may be caught 'casting the bones' before a select, if anxious and awe-struck, group.

If objection may be taken to the restrictions under the new régime upon the brewing of Kafir beer—in the opinion of the writer the natural beverage of the native, and a wholesome and nourishing one at that—it must be said that the compound manager of to-day suffers nothing like the worry and anxiety of his predecessor in the bad old times when the wholesale consumption of liquor was literally the menace and curse of the gold-mining industry. Then it was impossible to control the huge traffic in native drinking, for the authorities gave no real aid. Booths—they were little else—existed for no other purpose than the supplying of natives with drink, and the proprietor of one, of which the writer has grim memories, used to boast that each Sunday he took three hundred pounds from the 'boys' of the writer's compound ! Trapping was resorted to, and in proved cases fines were imposed by the court ; but such material opposition to the renewal of licenses was of no avail, as these were invariably renewed for twelve months. And what liquor ! Potato-spirit, bluestone, turpentine, paraffin, these were the principal ingredients, the profit on which must have soared into the region of 400 per cent.

The effect on the industry may be imagined. So incapacitated did the 'boys' become that it is literally true that not till the middle of the week was it possible to get a full complement of workers underground. This was the tale of every Sunday's loathsome traffic. And what of the compounds ? Try to conceive the miniature hells into which they were turned ! Take

a low estimate on a large property, and think of a thousand black demons maddened by this fiery trash raging about armed with knobkerries, pick-axe handles, and the like ; and remember as well the racial animosities such conditions arouse. As compound manager, and therefore their white chief, the writer was safe from harm, except by accident through flying bottle or iron bar ; but he was the only white man who would dare to enter the compound on such a Sunday night. Assisted by his native police, and engaged in separating bands of contending tribes, he has been in a dozen fights in a night, with knobkerries whistling round his head, while black skulls resounded to blows that would have laid white men out never to rise again. And all this that other so-called white men might profit by pandering to the black man's insatiable appetite for drink !

Much more might be written on this phase, but perhaps enough has been said to show that conditions at one time existed to handicap an industry which happily has small cause to groan under a like burden to-day. This is not to say that no liquor is now sold to natives on the Rand. They are as eager as ever, and will go to any lengths, to obtain it, whilst convictions of whites for illicit liquor-selling are of almost daily occurrence ; but, while it is a matter of individuals now, it was a case of thousands before.

As regards the important 'black peril' question, this is hardly the occasion upon which to refer to it. Suffice it to say that it is a very real menace, and one which no 'sophistical rhetorician' or misguided politician into whose hands the just demands of the whites are placed can afford to ignore. If the safety of our white women is not to be ensured under legal enactment, then it is not too much to prophesy that the day is not far distant when, upon the Rand as elsewhere, Judge Lynch will raise his horrific head.

Of the questions of native-labour supply as affecting the mines, and the suggested menace to the future of the white race in South Africa as a result of its rapid outnumbering by the aborigines, it is not proposed to treat in this article. While it is felt that the subject which forms its matter admits of much wider treatment, it is also hoped that it may prove alike interesting and informing to those for whom it has been written.

THE BRIGHT EYES OF DANGER.

CHAPTER IX.—I GET A NIGHT'S LODGINGS.

THE colour flowed and ebbed for an instant on her pale face. She was silent, and went slowly to the farther end of the room, where she stood in thought, resting a shapely arm on the

chimneypiece. There was something so infinitely tired, such a depth of trouble in her eyes, young eyes that ought never to have gathered so much as a shadow to them, that although the girl was

to all intents my jailer, the charge against me—whatever it was—so wildly wrong, and I, a Layton of Durrinston, was standing like a servitor before a slip of a maiden, I nearly forgot these things, and was so far left to myself that but for the stolid presence of the two Highland servants I could have knelt at her feet. I took a step forward, and laid a hand gently on her white arm.

'Do not touch me!' she cried, her eyes wet, her voice almost a wail. 'Sir, I saw your courage when first we met to-day. Courage is a goodly thing, I know; but I have seen brave men fail sometimes at a pass. Consider, sir, you are young, younger than your accomplices. Is it a man's work to use a man's misfortune or a woman's secret? Is there naught in some men's minds but greed and guineas? The world for you ought to be a place wherein to take the field for the Chevalier or the Usurper (either of them, so long as it be a man's clean choice), and face death if need be for what you hold to be the right. There lies the better part; but, instead of it, you come here hand in glove with base men, on a black errand, and but for the merest accident might have succeeded.' She came forward a step, a question in her eyes. 'You know, ah! you know him whom they call the Kestrel, and you know his pitiful story. Think, I pray you, are you proud of the enterprise? You know the root and the rise of it! Was there ever a fouler stroke? Was there ever a sorrier blot on a clan's stainless page?'

She broke off, and covered her face with her hands, her bosom in a tumult; and there I stood, in a coil of pity and bewilderment, but with my heart swelling. I could say nothing, for it was plain that, from her point of view, circumstances were black against me, plain that she believed I was an actor in some sinister design, plain that the men on guard needed but a signal from her to dirk me where I stood. Her appeal was to what she thought might be my better nature.

Gradually her weeping ceased, and I ventured to speak. 'You doubt—nay, you do not believe that—but I do not even know the name of your clan. I am an Englishman, and am so ignorant that even the tartan gives me no guide.'

'Oh'—she clenched her little fist—'would that I were a man!'

'With all my heart I wish that you were. In that case, at the most there might have been a fair fight, but I would have known why. As it is, here I have been standing listening to matters I have as little to do with as the Great Mogul; and I will say no more than that it is an idle business to try to get a plain statement from a crying woman.'

'Plain statement!' she blazed. 'Plain statement be it then, and mine is this. Here you remain until Glenira is out of reach of the clutches of you or your paymasters. When next you see the coward who wrote this letter

(if ever you do), tell him that Charlotte Macdonell was a wild falcon-gentle to lure.'

She turned her back on me, and signalled to one of the servitors. He unlocked the door, and Mistress Charlotte Macdonell went out, her dainty white chin in the air. The two men followed her, guarding the exit. Just before she disappeared at the end of the corridor she turned suddenly round, dropped a little mock curtsy, and called, 'The falcon-gentle gives you good-night, clumsiest of falconers.'

One of the men looked after her, and said something to the other in the Gaelic, the only words that either of them spoke during the extraordinary interview.

Long afterwards I took the trouble to find out what the words were. In English they meant, 'That one will be the mother of heroes.'

I heard the key rasp in the lock and the footfalls of the two men grow fainter and fainter. Soon they ceased altogether, and I was left alone. The room was darkening, for the afternoon was by this time far spent, and the only entrance for the light was through a narrow barred aperture near the ceiling and beyond my reach. The events of the afternoon had keyed me up to a high pitch of curiosity and excitement, for in my youth in quiet Westmorland I had gained little but hearsay knowledge of plots or affairs of State and Government, mere echoes from the great world beyond the dales. Indeed, a badger-hunt or a Cumberland wrestling match had been my modest limit in the personal adventure. Women had not given me a thought, nor I them. Yet in the passing of a half-hour there had come into my life a change as sudden as a mist on Skiddaw, and I could see not a yard into it. I had cantered blithe and care-free out of Edinburgh for the single purpose of killing an idle hour or two; and here I was locked in a strange, silent house by the warrant of a young and beautiful woman whom I had never seen before. As for the charge against me, I beat my brains to fashion out some explanation; but any that I contrived were so formless and so palpably misdirected that I soon ceased to try. All that I could extricate from what had happened was that the lady's name appeared to be Mistress Charlotte Macdonell; that she was in bitter trouble; that she counted me an enemy, and a cowardly one to boot. The thought stung me. Who was Glenira? Who was 'the Kestrel'? What was his *valise*, on the face of it a veiled reference? How came the letter in my holster, if indeed it was found there at all? Perhaps I had a 'double.' This might be the solution, I thought; but, on the other hand, the lady of The Garth, when first we saw each other near the sandhills, showed no actual hostility towards me; that only began on the return to the house. On reflection, it was clear that it

was the letter that marked me in her mind as a menace to herself and her kin, so dangerous indeed that I might easily that afternoon have looked into a pistol-barrel for the last time.

So I paced up and down the room, one conjecture chasing another out of my mind until the dusk came down and I could scarce see an arm's length in front of me. The silence that had been only irksome now became intolerable, and I was assailed by vague fears of what might happen to me in the darkness in my unarmed condition. Presently I heard footsteps, and saw the glimmer of a light below the door. The lock was turned, and the two fellows came in. One of them carried a lighted candle, a jug of water, and some coarse baked oaten cakes, and the other a blanket. The candle was set down on the chimneypiece, the food and drink on the table, and the blanket on the couch in the corner. The red-haired man pointed to the provender and the couch in turn, and without a word both men went out and locked the door. The fare, plain though it was, was welcome, for it was long since I had broken my fast, and I was sharp set. So I speedily fell to, cleared the plate, and, candle in hand, inspected my quarters more narrowly.

The door was massive, and the lock strong and defiant. The thought of escape by breaking prison presented itself only to be dismissed, for the walls of the room were thick and solid, and the window was out of reach, iron-bound, and very small. I dragged the table toward it, and climbed up. On tiptoe I could just get my eyes level with the bars; but the exercise gave me little comfort, for the night was like ink for darkness. I came down again to sit in the candle-light thinking of the strange and untoward events of the day. I had good cause for hot and bitter thoughts. I had entered (hastily enough no doubt, yet on an impulse close to the heart of all decent men) on some one else's quarrel. For my pains I had seen a knife struck at my heart, and, so far from emerging like a gallant figure of chivalry from the affair, here I was penned up in a lonely house like a cutpurse or a housebreaker. When I come now to set it all down in so many words on paper I know that my thoughts ran strangely little on my peril or indignity, but were vastly concerned with the grave, sweet eyes of my captor. The longer I thought of them the more I read tenderness and truth and courage in them, and I vowed by all held sacred that I would never rest an hour until I had gone, in her own phrase, to 'the root and the rise' of her hostility to me, and cleansed the name of Layton from the smirch of suspicion of complicity in these dark doings. What they were I could not even guess at, but I was certain they were ill-conceived; and if, as the day's events proclaimed, they meant danger to a woman, was it not the part

of a man, his blood running brisk and warm in him, to offer his right arm and counsel? The casuists may cackle that in like cases much hangs upon the age and graces of the lady; that a dimple, or a stray curl, or a white neck, or a pair of bright eyes have had a deal to do with affairs of chivalry and the ring of steel in the forging of history. They may be speaking the truth; but eyes sparkled before the casuists began to tire the world, and daft youth has had more share in this sweet and hopeful business of life than all the schoolmen.

So I recall that, as I sat there in the candle-light that night, my thoughts (which by all canons of sober sense should have been intent on ways and means of escape, or in trying to extricate a path out of the sudden tangle of my affairs) were as vagrant as a flight of birds (wild geese perhaps!), so that they sped and vanished and came back always to circle round the mental vision of the girl when first I saw her on the chestnut horse, her young eyes questioning mine. After the black night the morning might bring new adventures; but it held one good thing, the promise that I should see her, and seeing her I would make bold advocacy of my plea for opportunity to clear my name and stand again in the clean daylight of honour.

My circumstances forced me to sit doing nothing, for it was now quite dark, save for the miserable light from the candle's flame on the chimneypiece. I had (as I thought) explored the room thoroughly while the light lasted, and, in an extremity of dullness, paced to and fro in the room until I tired. It must have been five o'clock in the afternoon when I entered The Garth, and now I judged it to be almost midnight, though this was a mere hazard. The day had been a long one for me, for I had been up early; so I laid me down as I was, booted and spurred, and drew the blanket round me. The couch was hard beyond belief, its discomfort and my wakeful thoughts conspiring to keep my eyes open. I lay awake for a long time, in a silence of the tomb, until sleep at length conquered. How long I slept I know not; but I awoke to a curious sense of counting something in a dream, something rhythmic, like the slow ticking of a clock. I listened, but the place was wrapped in quiet, and I was just about to turn round and try to sleep again when the sound began again. It was no dream. I sat up straining my ears, and as I did so the sound became fainter. I rose and went into the middle of the room. The sound ceased. The candle was still burning; and, taking it in my hand, I looked in every corner of the room. There was no sound except my own breathing, though I stood motionless and alert for at least five minutes; so I got me to the couch again, out of patience with myself for allowing myself to be cheated by a trick of the nerves. No sooner had my head touched the couch than the sound

began again, a slow, dull pulse-beat repeated almost every twenty seconds. This was no trick of the nerves! I set myself to discover the exact spot whence the sound came. The couch was near the wall at the farthest end of the room—that is, the one parallel with the fireplace. I rose and lay full length on the floor, with my ear to the bare boards, and, distinct and unmistakable, always at the same regular interval, came the mysterious sound.

There was complete quiet but for its steady throb, and the fancy seized me that the dark old house hid somewhere a tired heart under its cold gray surface, and I was listening to its slow beating. But 'twas purposeless work lying there, and cramping for my body, so that I got up and frittered an hour away in conjectures as to the cause of the sound, discarding one after another until my head rang.

(Continued on page 122.)

SAFETY OF LIFE AT SEA.

By W. O. HORSNAILL, A.M.I.Mech.E., A.M.I.E.E.

BEFORE the interest in such matters was swept aside by the present war a great deal of attention was being given to the safety of 'those who go down to the sea in ships;' and in the August number of this *Journal* the regulations approved by the International Convention for the Safety of Life at Sea were described. These regulations have been embodied in an Act of Parliament which received the royal assent on the 10th of August 1914, and they will come into force on 1st July 1915.

Unless our passenger-ships can be made unsinkable the ultimate safety of those on board a doomed vessel is dependent upon boats, either those belonging to the ship or others sent by vessels which have come to the rescue. Since the *Titanic* disaster, 'boats for all' have been carried by all the large passenger liners, and this provision is, of course, insisted on by the new regulations. This question of boats is, however, a difficult one in the huge vessels now used for crossing the Atlantic. These leviathans carry some four thousand five hundred persons when the passenger accommodation is full up; and, as the usual ship's lifeboat only holds sixty people, at least seventy-five boats are needed. The boats are always carried on the topmost deck of all, known as the boat-deck, where they are fairly safe from damage by seas breaking over the vessel. This deck extends along the middle of the ship over the saloons and passenger accommodation, and its length in a nine hundred-foot liner is about four hundred and fifty feet.

Now the middle of the boat-deck has hitherto been set aside as a promenade for first-class passengers; hence, until recently, the boats were only carried at the ends, so as not to obstruct the view. This arrangement left room for eight boats on each side, with an extra and smaller boat in each corner alongside the end one, making twenty altogether, having accommodation for only about one thousand two hundred persons against some four thousand five hundred passengers and crew such a vessel would be certified to carry. Even with a line of boats right along each side of the boat-deck there is not room for the requisite number unless they

are stowed in pairs one on the top of the other. This plan is not practicable with ordinary lifeboats unless very special launching arrangements are provided; and to overcome the difficulty a type of boat is allowed which takes up very little height, so that as many as three may be placed in a pile ready for launching. These boats consist of shallow hulls built of wood and decked over, the hulls being filled with cork. The decks really form the floors of the boats, and collapsible canvas sides are built up round them to hold in the occupants and as a protection from the waves. It is practically impossible to sink a boat of this description, as even if it were punctured the cork would keep it afloat. Owing to their discomfort, however, a vessel will only be allowed to carry a certain proportion of her boats of this type, a number of the usual deep ship's lifeboats being made compulsory. The boat-decks on recent Atlantic liners are longer than in previous vessels, and by using these shallow lifeboats in addition to the ordinary boats it has been practicable to provide floating accommodation for all the four thousand five hundred persons on board.

The canvas sides for the shallow lifeboats described above perhaps sound rather flimsy; but they are made of enormously strong material, and the canvas is above the waterline, so that there is really no danger; in fact, with their cork-filled hulls these boats will stand more knocking about than the ordinary lifeboat, while any water which comes over the side simply runs out again through valves which will only open one way.

The risks attaching to the launching of boats have increased enormously with the increase in size of our liners, owing to the height of the boat-deck above the water.

The suggestions offered by the man in the street after any big shipping disaster clearly show that the difficulties of saving life at sea are not appreciated by the general public, a fact accounted for to some extent by the safety of modern passenger liners. How many passengers, for instance, have ever seen a boat lowered from a rolling vessel out on the ocean? In harbour

the operation is simple enough, as the ship is steady and the sea smooth; but even under these favourable conditions the manœuvre requires great care, as the height of the boat-deck above the water on a large liner may be anything between forty and sixty feet.

Thirty or forty years ago, before steamships reached their present gigantic proportions, it was customary to lower the boats with only a couple of sailors in them, who were joined by an officer and the remainder of the boat's crew after she was afloat. The passengers then waited until the vessel rolled over towards the boat or until a wave brought her up within jumping distance, when the women and children were handed down and caught by the crew, to be followed by the jumping of the men as favourable opportunities occurred. This system is impossible in the modern liner; and, although the passengers are embarked from one of the lower decks, the height is still far too great to allow of jumping, and the boats have to be lowered full of people. Each boat is attached by pulleys and ropes to two curved steel arms known as davits, which can be swung out over the water after the boat has been picked up from the deck. A couple of sailors then get into her, and other men pay out the ropes through the pulleys until she is lowered down to the deck where the passengers are embarked.

As the vessel rolls towards the side on which a boat is being lowered she tends to swing outwards from the davits like a pendulum, and if allowed to do this she will come back with great force against the side of the ship on the return roll. While the boat is being loaded with passengers she can be held up against the ship's side; but when she is full and being lowered into the sea this is no longer possible; hence, unless she can be got into the water before the return swing, the boat will almost certainly be smashed up and all her occupants drowned. This has happened time after time in bad weather; in fact, it is the general opinion of those best able to judge that lowering boats from a huge liner in a gale of wind and a heavy sea is practically impossible.

Another danger arises from the possibility of the rope at one end becoming jammed in its pulley-block, thus stopping that end of the boat from being lowered. If the other end keeps on going down, the boat is tipped up and those in her are pitched out into the sea. Of course this should not happen with proper care; but in the flurry and confusion of getting boats lowered, perhaps at night, many accidents of this nature have occurred.

If, as in future will be the case in large passenger liners, several boats have to be launched from each pair of davits, we shall have another difficulty to contend with in the twisting up of the ropes between the pulley-blocks when the bottom pulleys are unhooked from a boat just

lowered. There is no rope made which will not tend to twist and kink under such conditions, particularly if it becomes wet; hence as soon as the lower blocks are unhooked they twist round like the old-fashioned meat-jack, and it is impossible to haul them up for lowering the next boat.

Whether the line of boats on each side of a ship can be used depends upon the state of the wind and sea and the nature of the accident which requires the abandonment of the vessel. Except in calm weather, it is impossible to launch boats on the side of a ship from which the wind is blowing, as the waves would dash them against the vessel's side, and they would be broken up the moment they reached the water.

Supposing the engines to be available and the ship under command, the boats on the sheltered side would be launched first, then the vessel would be turned round so as to bring the boats on the other side into the right position for lowering. It is almost inconceivable that any accident which would render all the engines useless could occur to a modern liner in deep water; but the vessel might run ashore, as happened to the *Delhi*, or the weather might be so bad as to make turning round too risky a manœuvre with a sinking ship even if the engines were available. In either case only the boats on one side could be launched.

Great improvements have now been made in the method of stowing and launching boats, which partially overcome the above risks.

In the new White Star liner *Britannic* the arrangement of boats and the means provided for lowering them safely are far ahead of anything hitherto attempted in this direction. The boats are arranged in four rows right across the deck, instead of along each side, and lowering apparatus is provided at both ends of each row of boats, making eight boat-stations in all. There are forty-eight boats altogether, twelve in each row, and they are placed in pairs, one above the other. The davits consist of two enormous steel arms which can be swung far enough inward to pick up the boats nearest the middle of the deck, while when being lowered they can be swung out well clear of the ship's side, thus to some extent avoiding the danger of the boat swinging against the ship and being broken up. The boats in question are larger than usual, and will hold over one hundred persons each; furthermore, the passengers climb into them before they are lifted off the deck. This feature is of enormous advantage, as the passengers can take their places quickly from all around the boat instead of having to pass through a narrow gangway while the boat is dangling at a height of perhaps forty feet above the sea. When filled, each boat is picked up, the davits are swung outward, and she is quickly lowered into the sea, all these operations being performed by electric-power in far

less time than would be possible with hand appliances. Furthermore, instead of the old-fashioned pulley-blocks and ropes, single steel wires of great strength are used, which can be pulled up again in a few seconds, and all the boats can be run across the deck for lowering on either side of the ship.

Although the provision of boats for all is an excellent thing, it is still necessary to construct passenger-ships in such a way that they are practically unsinkable, as in at least twice out of three times when accidents occur the sea is too rough to launch boats at all. The P. & O. vessel *Narrung*, for instance, had a narrow escape from sinking during the Christmas gale in 1912, when the wind and sea were so terrific that there would have been no possibility of launching the boats. It might be supposed by arm-chair critics that if the vessel had gone down the boats would have floated off independently, and many persons might have been saved thereby. It is almost certain, however, that as the boat-deck sank down toward the water all the boats would have been smashed to matchwood. Again, at the loss of the *Veronese* the sea was too rough to use the boats, and rescue-work could only be carried on by the rocket apparatus until the storm had abated. More recently attempts were made to launch the *Volturno's* boats, with the result that all who got into them were drowned; while when the hospital ship *Rohilla* went ashore on the Yorkshire coast any attempt at launching the boats must have resulted in their destruction. On the other hand, if the *Titanic* had carried boats enough to accommodate all on board, with the most modern arrangements for launching them, every one might have been saved.

The most perfect arrangements for lowering boats would be useless after dark unless plenty of light were available both on the boat-deck and in the ship. Until recently electricity for lighting has been supplied from dynamos in the engine-room driven by steam; hence once the boilers—always in the bottom of the ship—are flooded no electric light is available, and this may happen long before the vessel will sink. Again, the engine-room, which is a watertight compartment, might be flooded through collision or the vessel running on a rock, thereby rendering the electric plant useless, although the ship was in no danger of sinking, and the failure of the lighting would cause great inconvenience, even if no actual danger accrued.

To avoid this risk the regulations demand a separate source of electric supply in the upper part of the ship, provision being also made for emergency lamps on entirely separate electric circuits from those used for the ordinary lighting. In the *Britannic* there are five hundred lamps connected to the emergency circuits, which are supplied from a large storage-battery containing enough electricity to last many hours. The electric motors for lowering the boats are, of

course, supplied from the same source, and likewise the wireless apparatus, which will, therefore, be available until the vessel actually sinks.

As regards the making of ships unsinkable, the new regulations demand the subdivision of each vessel into a number of watertight compartments. The new White Star liner *Britannic* has sixteen watertight bulkheads right across the ship, and any six divisions may be flooded together without endangering the vessel. In addition to these precautions against the risk of sinking, there is an inner skin all over the bottom and extending up the sides to well above the waterline, leaving a watertight space of five feet, which in its turn is split up into numerous divisions. It would, of course, be exceedingly irksome and wasteful of time if every one had to climb to an upper deck before being able to pass from one compartment to another; hence openings are made which can be closed by watertight doors in case of accident. The latter are held open by devices which can be let go from the bridge through electric wires, so that in an emergency the officer on watch can close all watertight doors at once. As this operation would, however, be dangerous to persons passing below without some warning signal, a bell is provided at each door which rings automatically when the apparatus is set in motion.

At the present time our ships are faced with new dangers in the form of mines and even torpedoes. Whether these engines of destruction will prove powerful enough to sink our largest liners, with their double bottoms and numerous watertight compartments, remains to be proved. When a comparatively small vessel strikes a mine, it is probable that the whole structure is damaged to such an extent as to render the joints in the plating leaky right along the ship, in which case the separate compartments are no longer watertight, and the vessel sinks. So far every vessel which has struck a mine has sunk within a few minutes; but this has not always been the case with torpedoes, as the *Cressy* was struck by two torpedoes, the second one hitting her a quarter of an hour after the first, during which interval she remained afloat.

Efforts are being made by inventors to devise some form of protection against mines which can be fixed to the bow of a vessel either to catch a mine in a species of net or explode it far enough in front to avoid damage to the ship. It is very doubtful, however, whether any practical protection of this nature is possible, as the device must be wider than the vessel herself and very much deeper; otherwise, when the bow lifts in a heavy sea, the protective arrangement might pass over the mine. Again, such a device would reduce a vessel's speed considerably by its resistance to being pushed through the water, and it would have to be of massive construction to withstand the power of the waves.

A RISE IN HIS SALARY.

CHAPTER II.

SKENE, once more back in his accustomed place in front of his big writing-desk, asked himself for the thousandth time if he was glad that he had stumbled unawares—of course he had got his head-clerk's address written down somewhere, but for years he had forgotten what it was—upon James Cooper's humble home the preceding Saturday, or if he was sorry. Cooper had been extraordinarily kind, certainly; and the hot bath and change of garments with which he had supplied him had saved him from a severe chill, if from nothing worse. Also, it had been very pleasant taking tea with the clerk and the little girl, Pansy; but now it was annoying to think that he had made a fool of himself over it.

He had raised Cooper's salary. Cooper, as he sat by the fire after tea, with Pansy on his knee, had confided to him his reason for requiring a higher wage than the one with which he had been satisfied previously. Hitherto he had only had himself to bother about; now there was another person to provide for. He had adopted Pansy. The only child of a ne'er-do-well brother who had died recently, she had come to him literally devoid of all worldly goods except the dolly Rosa, and what was sufficient for a single man was insufficient for a family.

More than this—and the blushes which spread over Cooper's meek countenance mounted even to his bald pate as he came to this part of his narrative—for the first time in his life he was daring to contemplate matrimony! Pansy must have some one to look after her, and the little maid-of-all-work was not fit to be entrusted with so important a task. A mother, therefore, for Pansy must be found, who, incidentally, would of course have to be a wife to her uncle.

Skene had almost laughed when he heard this; anything to do with love-making or romance had seemed so incongruous in connection with Cooper! But he had laughed outright when, in answer to his question who the fortunate lady of his choice was, the head-clerk answered, 'Miss Jenkins.'

Miss Jenkins! Why, out of the whole world of women, had Cooper chosen her? But then, of course, in his narrow life the poor clerk had not many opportunities for meeting attractive women. Possibly Miss Jenkins and Miss Carey, the two typists at the office, were the only women he was acquainted with intimately. Yet, of these two, why had he chosen the obviously older and plainer?

'Miss Jenkins!' Skene had cried, unable to conceal his amazement. Then, fancying that

perhaps he had not heard aright, 'Er—you are quite sure that you did not say Miss Carey?'

But the head-clerk, although his pink cheeks grew pinker and he obviously showed signs of confusion, had answered quite firmly, 'Miss Carey, sir, is a very attractive young lady; but she is, I should say, a little inclined to be—er—flighty and extravagant. Miss Jenkins is more sedate—older—she would be less expensive.'

'Oh yes,' Skene had replied, '*she* would not be—dear!' And Cooper's sense of humour was not sufficiently developed to observe that his master had, though quite unintentionally, made a pun.

Now, on this following Monday afternoon, here was Skene waiting, with an interest which he did not often display toward the affairs of others, for the news of Miss Jenkins's engagement. He had noticed Cooper following her sheepishly as they left the office together during the lunch-hour. Doubtless the head-clerk had taken that opportunity for proposing.

Of course she would accept him; no woman prefers to work for herself when she can get a man to work for her; and Cooper was not a bad little chap—he would give her a home.

A home! Skene's thoughts travelled back unconsciously to the little gimcrack parlour in the little gimcrack house. Again he saw Cooper seated at the head of the tea-table with the pretty child on his knee. Poor devil! He would find it a hard struggle with a woman and a child to provide for even with his additional twenty shillings a week; and yet there had been a look on the head-clerk's face, as he stroked Pansy's hair, which might make any other man who had not got a woman or a child to provide for envious. Cooper was supremely happy in his little jerry-built home, happier than his employer in his substantial, luxuriously furnished house in Pembridge Square.

Skene frowned, and struck the little bell in front of him sharply. When, a moment later, Miss Jenkins came into the room the momentary softness which had been in his eyes vanished, and he was once more himself—hard, entirely business-like.

'I want you to take down some letters, please,' he said.

The typist seated herself opposite him, and for some minutes the only sounds to be heard in the big room were Skene's voice and the faint scratching of her stylographic pen. Yet all the time that he was dictating Skene watched her furtively. But her face was, as usual, quite emotionless, and he was conscious of a slight

feeling of annoyance. Hang it all! a woman of her sort of appearance didn't get proposals every day; was she totally devoid of feeling, that she still looked like a gravenimage?

The lawyer was surprised at himself for displaying such sudden interest in the affairs of a fellow-creature; but—well, there was no blinking the fact—he had changed in a most extraordinary way since last Saturday, and he really wanted to know the result of Cooper's first proposal of marriage. For one thing, he himself would be sorry to lose Miss Jenkins; she was an excellent worker. He would like to know when exactly he *was* to lose her.

He tapped his long fingers impatiently on the table. 'That will do for the present,' he said curtly.

Miss Jenkins rose, and was moving toward the door, when he suddenly called out to her, 'Stop a moment, please, Miss Jenkins! I want to speak to you.'

She turned, and once more stood docilely before him, though there was mild interrogation in the eyes behind the big spectacles.

'Er—I was going to ask you, Miss Jenkins, if you knew of any other lady who could fill your place when—you leave us. For you *are* contemplating leaving us shortly, are you not?'

It was clumsily, abominably done; but it was the only way, apparently, in which he could satisfy his curiosity. And a moment later he felt he could sink into the earth when Miss Jenkins, flashing the big spectacles upon him in a surprise which was not mild this time, said stiffly, 'Excuse me, but I do not quite understand. I was not contemplating leaving you.'

He had blundered horribly. He gave a sickly smile, and indicated to Miss Jenkins that she was to sit down again.

'Miss Jenkins, I apologise! Now that I have gone so far, however, I will explain myself. I was under the impression that you were—that you were going to be married.'

'I am not going to be married,' said Miss Jenkins.

A crimson flush dyed her cheeks. Poor creature, her feelings were deeply wounded, no doubt; and for a moment Skene felt that the blunder he had just made was even worse than he had at first imagined. The wild thought flashed through his mind—suppose, after all, he *had* heard amiss on Saturday, that Cooper had not said that it was Miss Jenkins he was going to propose to, but Miss Carey? Of course he *had* meant Miss Carey! No sane man would ever contemplate matrimony with Miss Jenkins!

Wouldn't he? Suddenly Skene, whose eyes had been intently fixed on the figure opposite him, noticed—what in the whole course of his acquaintance with Miss Jenkins he had not

noticed before—that her face, without the disfiguring spectacles, was really not an ugly one; her mouth and nose, indeed, were small and well shaped, and her figure, in spite of the atrocious clothes, was well proportioned. But it was the cut of her garments and the way she did her hair!

'Miss Jenkins,' he said in a low voice, 'I apologise again. If I have hurt your feelings I am deeply sorry. But I was under a misapprehension.'

'You were, I suppose, in Mr Cooper's confidence,' interrupted Miss Jenkins.

As she spoke she raised her face and gazed at him, and he was astounded, but he could have sworn that he saw a faint twinkle in the eyes behind the spectacles; that the mouth, which he had never before seen to smile, was twitching as if with suppressed laughter.

'Mr Cooper did propose to me during the lunch-hour,' she continued calmly, 'but I refused him.'

She had refused him! Miss Jenkins—dowdy, overworked Miss Jenkins, without a penny in the world except what she earned—had refused the offer of a home, and a good, kind man to look after her! It was incredible! However, he would not add to his former blunders by betraying his astonishment, so he said somewhat lamely, 'Ah, well, we all have our reasons. It was the child, I suppose, in this case; for Cooper told you, of course, of his adoption of his little niece. The child might have been a nuisance to you.'

'Oh no!' said Miss Jenkins. 'I adore children! I should love to have a home too; in fact, I think that a home, however humble, and some one whom you love in it, are the only things worth having in this sad old world.'

She spoke softly; there was a tender ring in her usually expressionless voice which altered it amazingly; and as just before Skene had realised that Miss Jenkins was not really ugly, so he realised now that her voice, when it was charged with emotion, was really pretty. It reminded him, strangely, of another voice which he had once thought pretty—years ago.

The man looked up. He did not know that his hands were trembling, and that as he spoke his voice was a little husky. 'I agree with you,' he said. 'A home, and some one whom you love in it. I used not to value those things; but—since last Saturday, I suppose'—he gave a queer, shaky little laugh—'I have begun to do so. After all—after all'—

He broke off. He leant his elbow on the table and shaded his eyes with his hand. He had forgotten Miss Jenkins, forgotten the office, even forgotten what hitherto had been his main interest in life—money. A home, and some one whom you love in it! Well, he had despised the little home when he had had it then, and Doreen, for all her sweet young beauty, had been

a drag on his ambitions, or so he had thought! It had been better for them both when she left him. Had it been better?

He sighed, and lifting his head again, saw his face in a mirror on the opposite wall. He was within two weeks of forty, and the glass told him that he looked fifty. He was thin-lipped, lined; his eyes looked hard and mean. Yet he had been extraordinarily successful in life. Skene & Skene, the famous old-established firm of solicitors, were doing far better now than either in his father's time or in his grandfather's. He had not made friends, but what an ambitious man values perhaps more—enemies. He knew he was envied. He knew that it was only a matter of time before he got into Parliament. Perhaps, some day, he would even have a place in the Cabinet.

Miss Jenkins's voice—strangely soft, and still with that little tender ring in it which reminded him so of that other voice—brought him back to earth again.

'I cannot marry Mr Cooper, because I am married already,' she was saying.

Married already! The unattractive Miss Jenkins married! He stared at her stupidly, and suddenly Miss Jenkins rose from her seat.

'Ah, John, don't you remember me?' she cried. As she spoke she pulled off the disfiguring spectacles, and pointed to the untidy mop of gray hair. 'It is a wig,' she said, half-laughing, yet with at the same time half a sob.

Ah, he understood why her voice had stirred that chord of memory now! For it was Doreen! Doreen, with her little dark gypsy face and black eyes sparkling with mischief and fun! No, they were not sparkling; they were full of tears. She fell on her knees at his side, and caught hold of his hand.

'I wondered if you were ever going to soften; and then, when Mr Cooper told me that you had raised his salary, and had been so nice to his little niece Pansy, it seemed to me that you were softening at last. But if you still don't want me I will go away again, as I—as I went once before. Oh! perhaps I ought not to have revealed myself even now; but I felt that I could not go on living beside you any longer, seeing you every day, hearing your voice, without—without breaking down. John!'

He was dazed. He passed his hand again over his eyes. 'Doreen!' he whispered.

Once more his mind travelled back over the years. The hasty marriage between the boy of twenty-three and the girl of seventeen. The concealment from his people, because she was only a little, unknown singer, and he a brilliant young undergraduate who was going to do well. The almost immediate repentance of his rashness; and yet not altogether repentance, for they had tasted a certain sort of delirious happiness in the cheap lodgings where he had hidden

her. And then the discovery, one evening when he had stolen away from his father's house to visit her, that she had gone! Gone, leaving no address, no farewell even, save the badly scrawled, tear-stained note in which she said she knew that she was only a hindrance to him, and that he would be happier without her.

He groaned—and he felt a tear drop on his imprisoned hand.

'Oh John, it has been such a struggle! But I managed to keep myself somehow—on the stage—till I lost my voice after a bad attack of diphtheria; then governessing, typing! Then, six months ago, I saw your advertisement for a typist in the *Times*, and I so longed to see you again; and, as I knew something about make-up, I disguised myself and applied for the post. Oh, it was torture being near you; not able to speak even, except in a feigned voice, for I was so afraid of betraying myself—you remember I was always good at mimicking voices—and yet it was the only happiness I had had since I left you! For, John, it was my pride which in the first place made me leave you, and then prevented my coming back. I—I loved you all the time!'

He put his hand on the little graceful head—she had taken off the wig, and her dark cloud of hair fell round her shoulders.

'And I loved you, Doreen! I never knew it, I think, until two days ago, when I saw Cooper, with his child and his home. I realised then that in my own life there was an emptiness which neither my work nor my ambitions could fill. I wanted something else. I wanted my wife.'

Skene rose and held out his arms, and she rose too and crept into them. And then, after a long silence, in which they were unconscious of anything else in the world except each other, they suddenly and simultaneously remembered Cooper. They looked up, and laughed.

'Poor chap!' said Skene; 'I have found my wife, but he has lost his. He loved you too, darling.'

The old merriment flashed into Doreen's eyes. Her cheeks dimpled as they had dimpled when she was a girl. 'No, John, he did not love me. He respected me—who would not respect a woman as plain as I made myself?'—her laugh rippled out gaily—'and he wanted to marry me because he thought I should be sensible and thrifty. But the woman he really loves—and would infinitely prefer to marry if he could afford it—is pretty, flighty Miss Carey. I fancy, too, that she cares for him.'

Skene gave a mighty shout, and as Doreen's face was like a girl's, so his was almost like a boy's again. 'Good old Cooper!' he cried joyously; 'I'll raise him another pound a week in salary!'

THE END.

TUNIS: A COMING WINTER RESORT.

By EUSTACE REYNOLDS-BALL, F.R.G.S.

THE Regency of Tunis, theoretically little more than a French protectorate, is to all intents and purposes a French colony, for even the nominal suzerainty of Turkey was shaken off long before the French occupation (or rather conquest) in 1881. Its political relations with France are sometimes compared with those of Great Britain and Egypt. A more accurate comparison would be with Cyprus, which was virtually a British Crown colony, though technically a part of the Ottoman Empire until its recent annexation by Great Britain. But however anomalous the tenure of Tunis, the French have some reason to be proud of what they have done in the administration of this oversea France. Indeed, it is the only one of her African colonies and protectorates which is self-supporting. Algeria, for instance, partly owing to the swarms of petty functionaries, has always been administered at a heavy loss.

The capital, Tunis, stands on a neck of land between the landlocked inlet of the sea known as the Lac de Tunis (El Bahira) and the half-dried-up lagoon Sebkhah es Sedjoui. The modern French quarter gradually merges into the densely populated native city, which is, next to Cairo and Alexandria, the largest in North Africa.

Tunis cannot boast of so beautiful a situation as Algiers, with its magnificent sea approach; yet the view of the city from the heights of the Kasbah or the roof of the Bey's town palace (Dar el Bey) is very fine; though for beauty of situation Tunis must yield the palm to Algiers, the Genoa of North Africa, while the view is inferior to that from the Byrsa Hill of old Carthage.

Beyond the roofs and domes of the White City—a sobriquet now, alas! too suggestive of Shepherd's Bush—spread out like a sheet, the eye wanders over the Little Sea (El Bahira), intersected by the ship-canal, by which the great liners of the Compagnie Générale Transatlantique now take passengers direct to the quay of Tunis, ignoring the once busy port of La Goulette. To the right are the little watering-places of Hammam-Lif and Korbous, on the shore of the promontories terminated by Cape Bon. To the left may be discerned the ruins of the Roman aqueduct, carrying the eye of the spectator to the site of ancient Carthage on the Byrsa Hill, backed by the white houses of Sidi Bou Said. Southward the horizon is bounded by a range of mountains culminating in the rugged peak of Zaghuan. In the foreground the most notable features in the panorama of Tunis are the Bardo Palace, Belvedere Gardens, the graceful minaret of the Mosque es Zitouna, the domes of the Sidi Mahrez Mosque, and the Roman Catholic Cathedral.

Climate is, of course, a factor of great importance in the choice of a winter resort, and in this respect Tunis deserves favourable consideration. Though Tunis is not so well sheltered as Algiers, it enjoys a winter climate almost as mild. This is indicated by the striking resemblance of the fauna and flora to those of Algeria. The mean temperature during January is fifty-one degrees Fahrenheit. In summer, however, Tunis is far less suitable than Algeria as a residence for foreigners, as it is much exposed to the sirocco, and the mean August temperature is as high as eighty-one degrees Fahrenheit. Most rain falls in January and February. The most prevalent winds during the winter months are the east and north-west. Though not so mild as Egypt, it is far more equable, and there is not that sudden fall of temperature at sunset which is the one drawback of the drier Riviera climate. The water-supply is very good. It is brought from Zaghuan, and the old Roman aqueduct was restored to form the channel for this new water-supply, which is brought to the huge reservoirs beyond the Kasbah called the Château d'Eau. The cost of the work was enormous, exceeding by several millions of francs the original estimate of eight million francs.

The chief sights are the bazaars, the Bardo Museum, and the Belvedere Gardens. It is true that mosques are usually included in the itinerary of the local guides; but only the exteriors can be seen, as in Tunisia (with the paradoxical exception of the Holy City of Kairouan) all mosques are closed to non-Mohammedans.

The most interesting of the Tunis *souks* (bazaars) are to be found in the Medina quarter, near the Mosque es Zitouna. They are more oriental in character than those of Algiers or Constantinople, and are roofed over, as in Constantinople and Damascus. The small, narrow booths are shut in by a counter separating them from the street, and the shopkeeper is accustomed to swing himself into his seat behind the counter with the aid of a rope. The bazaars which still interest visitors most are the Souk Attarin (perfumes and spices), Souk des Etoffes (carpets and rugs), Souk Sekajine (saddlery), Souk el Trouk (burnouses), and Souk el Berka (gold and silver wares and silver filigree-work). Unfortunately most of the oriental articles in the bazaars, especially in the larger ones, are not indigenous, but manufactured in Europe; for instance, much of the silver filigree-work comes from Genoa or Malta, the more expensive gold jewellery from Paris, and the burnouses from Manchester; while even the fezes are of European manufacture, except those from Zaghuan. But genuine indigenous wares are to be found by

the discerning tourist in the Souk des Etoffes, Souk Sekajine, and the Souk el Trouk.

It is not at all likely that the tourist will pick up bargains in the Tunis bazaars, and he must not suppose that he will get even with the polite but wily trader by following the advice of the guide-books and only offering a third or a half of the sum originally asked. The shop-keeper is fully aware of this fond delusion of the globe-trotter, and usually arranges the original price to allow for the recognised reduction. A useful wrinkle to remember is to visit the bazaar as early as possible, as it is thought unlucky by Mohammedan traders to refuse the offer of the first customer of the day.

The museum at the Bardo, officially known as the Musée Alaoui, contains the most important results of excavations in all parts of Tunisia, and here is to be seen the finest collection of Roman antiquities in North Africa. The most valuable objects are a torso of Athena from Hammam Darradji, a magnificent mosaic pavement ('Triumph of Neptune') from a Roman villa near Susa, a silver-gilt *patera* found at Bizerta, a bronze Hermes and a bronze Eros (four and a half feet high). In the same building is the Musée Arabe, with mosque tiles from Tunis and Morocco, carpets from Kairouan, metal-work, weapons, &c.

The Bardo Palace is hardly worth visiting, but the orangeries of the present palace of the Bey (formerly the palace of the harem) should be seen. It was here that the momentous treaty by which France practically annexed Tunisia was signed on May 12, 1881, by the Bey, Mohammed es Sadok, and General Bréard, the commander of the French army of occupation.

In the matter of recreative resources Tunis cannot, of course, be compared with the fashionable winter city of Algiers, but still there is no lack of urban amusements to distract the pleasure-seeker. There is an excellent theatre, where operas and operettas are given during the winter, and a well-appointed casino (concerts, musical comedies, baccarat, restaurant, &c.); while a military band plays on three afternoons in the week in the Place de la Résidence.

Among the outdoor amusements which can be indulged in is golf, a small course (nine holes) having been laid out at K'sar Said. There are several race-meetings during the winter and spring, and the Carnival festivities include a distinctive feature in the shape of Arab fantasias.

Locomotion is rendered easy by a well-organised electric tramway system through the city and suburbs, electric trams running also to La Goulette, La Marsa, and old Carthage.

There is a good choice of hotels, the leading ones being the Tunisia Palace, Grand, Paris, France, and St George, the tariff being reasonable—nine to ten francs, except at the fashionable Tunisia Palace, where the *pension* rates are from thirteen francs upwards.

The spiritual needs of English visitors are met by the English Church of St George. Then there are a British Consul and several English-speaking medical men.

Tunis makes a good centre for excursions, and now that there has been so great an expansion of the Tunisian railway systems, Zagouan, the ruins of Oudna, Susa (Sousse), El Djem, Sfax, and 'Kairouan the Holy' can be reached by train. But the chief excursion is to ancient Carthage. This famous city was founded by a Phœnician colony in the ninth century B.C. The citadel was built on the hill called Byrsa, and was surrounded by suburbs in all directions, extending from the ancient harbour (of which traces remain) to beyond Sidi Bou Said. Indeed, when the city of Dido was taken and sacked by Æmilianus Scipio it had a circumference of nearly twelve miles. It replaced Utica as the capital of the province about 29 B.C.; and it ultimately rose to the position of the greatest Mediterranean seaport after Alexandria, and the third city in the Roman Empire. By the second century Carthage had taken the place of Alexandria as the chief seat in North Africa of the Christian Church. In 698 the Arabian Governor, Hassan Ibn en Noman (the Caliph's lieutenant), captured Carthage and destroyed the last vestiges of Punic and Roman culture.

Very little remains *in situ* of the glory and splendour of ancient Carthage. For centuries the Genoese, Sicilians, Pisans, and Tunisians have used the ruins as a quarry, and have carried off valuable statues, columns, capitals, marbles, vases, inscriptions, &c., to enrich the cathedrals of Cordova, Palermo, Pisa, Amalfi, and the museums of Tunis, Susa, and the Louvre. Considerable excavations have been carried out by the Pères Blancs, and now some one hundred and fifty feet of the curious Roman wall built of jars (*amphore*), in layers without stone of any kind, has been disinterred. A visit to the Punic cemeteries, great Basilica, Roman cisterns and aqueduct, and the Cathedral of St Louis would occupy a whole morning. The guide will no doubt insist on showing the Chapel of St Louis; but this mean and insignificant memorial is in a sense fraudulent, for the marble statue supposed to represent the saintly king of France is now known to be a statue of Charles the Fifth, sent in error from Paris! But unless the tourist has some archaeological taste, he would be wise to cut short his explorations and devote most of his time to the interesting museum, which is of great importance, and may be regarded as unique in a sense, as it is almost wholly confined to the yields of excavations in ancient Carthage. Indeed, visitors have here an opportunity of examining the remains of a civilisation spreading over nearly three thousand years.

Tunis should certainly appeal to the artist and archaeologist as well as to the mere holiday-maker. Indeed, the City of the Beys will prob-

ably be more appreciated by the visitor of artistic proclivities than the much Europeanised Algiers. Here the oriental atmosphere is more dominant. The quarter of a century of French civilisation has only touched the surface, and has interfered very little with the semi-barbaric but picturesque Arab manners and customs; and strangers will carry away with them vivid impressions full of local colour. The archæologist will find Tunis a particularly rich field for his studies. Roman amphitheatres, temples, triumphal arches, baths, aqueducts, &c. strew the littoral and the hinterland of Tunisia. Indeed, nowhere in the world outside Italy will be found so many traces of Roman civilisation. The choice of Roman remains is an embarrassing one; but the most important will be found at Dougga, El Djem, and El Kef. But the visitor sated with Roman remains has a choice of a large number of excursions by steamer, rail, or diligence. There are the ports of Susa and Sfax, easily reached by steamer; the quaint old town of Gafsa; Metlaoui, the starting-place for the grand gorge of the Seldja, almost as fine as the famous Chabet Gorge in Algeria; Gabes, whence the Troglodyte villages and the island of the Lotus Eaters can be visited, to mention only a few.

The sportsman will find very fair shooting at the cost only of a game license (twenty-six francs), for in Tunis no expensive permit is required; nor is there any limit to the number of head which may be killed, as in the British colonies and protectorates in Africa. Wild boar, jackals, and hyenas are plentiful all over the interior; gazelles are frequently found in the

plains; while panthers, tiger-cats, and lynxes are occasionally found in the Khroumir forests. Barbary deer are often found in the pine forests of Ghrardimaou; while small game, such as the hare, partridge, duck, plover, sand-grouse, snipe, and woodcock, are plentiful, and afford good sport.

The question of how to reach Tunis is easily answered. It is very easy of access. Indeed, by the Monday's express service of the Compagnie Générale Transatlantique it is possible to reach this 'Gate of the Orient' in fifty-six hours after leaving London. Even by the ordinary services of this company (which call either at Ajaccio or at Bizerta), or of the rival company, the Compagnie Navigation Mixte, Tunis is brought within three days of London. The cost of the journey from London, *viâ* Dover and Marseilles, is exactly the same as to Algiers—ten pounds fourteen shillings first (sixteen pounds eight shillings and sevenpence return), and seven pounds ten shillings and a penny second (eleven pounds nineteen shillings and sixpence return). The C. G. T. boats are luxuriously appointed but expensive, and the tourist of modest means will probably prefer the C. N. M. line, which is slower, but comfortable and less crowded. To the tourist of leisure the all-sea route, *viâ* Algiers, will probably appeal. During the season the boats of the Nederland Royal Mail Line call regularly at Algiers from Southampton. There is a daily through service by rail from Algiers to Tunis (five hundred and fifty-seven miles), with sleeping-car, the journey taking twenty-six hours.

THE STRANGE HISTORY AND MYSTERY OF SOME FAMOUS PRECIOUS STONES.

By M. WINIFRED HURLSTONE-JONES.

BATTLE, murder, and sudden death are three awe-inspiring facts; and probably nothing in the world's history of inanimate objects has contributed so often to these three dread events as the precious stone. To read the story of some precious stone of fame is to be hurried from one thrilling adventure to another; and it must be a singularly unimaginative person who can resist the feeling that in some mysterious manner these glittering objects, the materials of which the scientist can tell us in detail, have not some occult power, some obscure but potent influence, over the destinies of men.

Few stones have had a more chequered career than the famous 'Hope' diamond, which is said to have found a watery bed when the *Titanic* sank; a statement to this effect appeared in a well-known weekly paper, and has never been contradicted. That it should go down in the most tragic shipwreck on record would seem peculiarly appropriate to a stone which rarely

brought aught but ill-luck to its possessors, be they whom they may. It was brought to Europe by Jean Baptiste Tavernier, the famous traveller, who sold it to Louis the Fourteenth, by whom it was placed among the crown-jewels. Tavernier died a ruined man in his old age. The gem adorned the beautiful Madame de Montespan, who was supplanted in the king's favour by Madame de Maintenon; it was borrowed by Nicolas Fouquet—who was made *procureur-général* to the Parliament of Paris in 1650 by Mazarin, and superintendent of finance in 1653—for one of the costly fêtes which he was fond of giving, and which are supposed to have aroused the king's jealousy. Fouquet was arrested and imprisoned, and finally died in disgrace. The famous blue diamond aroused Marie Antoinette's admiration, and it was given to her by Louis the Sixteenth; and it was occasionally worn by the ill-fated Princess de Lamballe. The horrible fate of all three is, of course, history. During

the French Revolution it was stolen, and its fate during the next forty years is unknown. It is stated that an Amsterdam diamond-cutter, Wilhelm Fals, had been commissioned to cut it; but that his son stole it from him, with the result that the elder Fals was ruined and the son committed suicide. Young Fals is supposed to have passed the diamond on to a Frenchman, Farcios Beaulieu, and from him it passed into the hands of a dealer, who about the year 1830 sold it to the late Mr Henry Thomas Hope for eighteen thousand pounds. The curious part of its history is that so long as it remained in the possession of the Hope family its malign influence—or, let us say, the curious train of ill-luck which accompanied it—seemed dormant. But at the death of Mr Hope it was purchased by a merchant, who took it to New York and sold it to an American jeweller. The jeweller fell into financial difficulties; and after passing through the hands of a French broker, the diamond was bought by a Russian prince, who either gave or lent it to a beautiful actress at the Folies Bergères. The first night she wore it the prince shot her from a box while she was on the stage, only himself to meet with a violent death at the hands of revolutionaries within a few days. The broker who had sold the stone committed suicide. It then passed into the hands of a Greek jeweller named Simon Montharides, who was thrown over a precipice and killed after he had disposed of the stone to the ex-Sultan Abdul Hamid, whose favourite, Salma Subayba, was wearing the jewel on her breast when the Young Turks broke into the palace, and she was shot dead by her master. The stone is said to have then passed into the hands of Habib Effendi, who possessed a marvellous collection of gems, the price paid being, it is said, eighty thousand pounds. Habib Effendi was drowned in the sinking of the Messageries steamer *La Seyne* in collision off Singapore. His collection of jewels was sold in 1909; and the last known owner of the 'Hope' was Mrs. McLean of Washington, whose husband is reported to have bought the stone in ignorance of its tragic history. On learning from the newspapers the trail of ruin that followed previous owners of the 'Hope,' he endeavoured to refuse the purchase; but after litigation, he finally took the stone. Whether it sank in the *Titanic*, as was stated in the Press, seems uncertain, and the writer has failed to get confirmation or denial of the statement. At any rate, such a termination to a story of bloodshed and sorrow would not be inappropriate.

The 'Sancy' diamond is as famous in a way as the 'Hope'; but experts disagree considerably as to its history. It was worn by Charles the Bold at the battle of Graussen, and was picked up on the battlefield by a Swiss soldier, who sold it to a priest for a florin, a coin of more value, of course, than our two-shilling piece. The priest sold it for two florins, and its history is vague

till 1589, when it came into the possession of Antony, the Prior of Crato, who gave it as a pledge to Harlay de Sancy, Treasurer-General of France, after whom it was eventually named. Sancy is said to have purchased the stone from the prior for the sum of one hundred thousand Tournois livres. It remained in the family till Henry the Third of France asked for the loan of it, as a pledge for a corps of Swiss mercenaries that was to be formed. The servant by whom it was sent disappeared, and on search being made it was found that he had been assassinated in the village of Dole, and his body had been buried by the village curé. De Sancy ordered the body to be exhumed and opened, when, as he suspected, the diamond was found in the stomach. The stone then came into the possession of the English Crown, but it has been variously asserted to have been sold to Queen Elizabeth, James the First, and James the Second. The most likely story seems to be that the diamond was sold to James the First in 1604, and that during the Civil War in England Queen Henrietta Maria, wife of Charles the First, carried it to France, and pledged it with another to the Duke of Epemon. In 1657 Mazarin, with the queen's permission, bought the stone, and he bequeathed it with others to Louis the Fourteenth. It was amongst the French crown-jewels inventoried in 1791, which were stolen in 1792 and recovered in 1794. It was sold in 1796, and most writers agree that it passed into the possession of the Demidoff family. It is said to have been among the Spanish crown-jewels in the early part of the nineteenth century; then passed to Prince Demidoff, and later to the Maharajah of Puttiala. Another version has it that Fouché recovered it for Napoleon, who sold it to Prince Paul Demidoff. From him it passed to the Earl of Westmeath, and afterwards to the heirs of the multi-millionaire, Sir Jamsetjee Jeejeebhoy. Its last owner is rumoured to be the daughter-in-law of William Waldorf Astor.

Certain stones, too, are indelibly bound up with the history of a country, and as such have a value far above their intrinsic worth. For instance, there is the diamond known as the 'Rajah of Matan,' an uncut pear-shaped stone weighing about three hundred and eighteen carats. The reigning princes of Borneo hold this stone in superstitious reverence, as they are firmly persuaded that their fortunes are indissolubly linked with the possession of the jewel. This belief is also shared by their people, who not only believe that it affects their country's destiny, but also attribute to it miraculous power, thinking that water into which it has been dipped will cure all diseases. It is a rare and high honour to show it to visitors, who must on no account touch it. When shown once to the captain of an Indiaman it was exhibited on a salver of gold. Like most famous jewels, it has been the cause of wars and tumults. It is supposed to have been found in the eighteenth century in the Landak mines on

the west coast of Borneo, Landak being the territory of the Rajah of Matan. The Sultan Gurn Laya claimed it; but he handed it over to the Rajah of Landak, whose brother got possession of it, and presented it as a bribe to the Sultan of Sukadana in return for the latter's promised aid in putting him on the throne of Landak. The lawful prince fled to Bantam, and with the aid of the prince of that country and of the Dutch he regained his own territory, and nearly destroyed Sukadana. As much as one hundred and fifty thousand dollars, and two large war-brigs, complete with guns and ammunition, as well as other stores, were offered and refused for this stone.

The famous cat's-eye of the King of Candy, which was formerly in the Beresford-Hope collection, carried with it the right of succession to the isle of Candy, which belongs to Britain. Although nominally bought by a private purchaser for a few hundred pounds, as a matter of fact the Government was the real purchaser of the jewel, as considerable importance was attached to its history from a political point of view.

Other historically famous stones are the 'Regent' or 'Pitt,' a square-cut brilliant, whose history is as romantic and as historically interesting as any. It was in the possession of Governor Pitt, grandfather of William Pitt, first Earl of Chatham; and though a good deal of uncertainty surrounds its history prior to Pitt's obtaining possession of it, there is no doubt that diamonds at that period were largely used in India as a means of remittance to England. Pitt bought the diamond from a merchant for twenty thousand four hundred pounds, and it was sent to Sir Stephen Evance in London by the *Loyall Cooke*, and Sir Stephen was requested to act for the Governor in the matter of the cutting and disposal of the stone. The wonderful diamond made a sensation in London, and Pitt's estimate of his purchase rose accordingly, for he wrote that he 'would not have it sold (unless it be for a trifle) at less than fifteen hundred pounds a carat.' 'These and the years following were troublous ones for the Governor. Reports which reflected upon his acquisition of the stone were circulated; he was evidently suspicious of his agents in London, and as much of his private means was invested in it, he felt that the future of himself and his family depended on its disposal.' The expense of cutting it was six thousand pounds, and the chips were valued at ten thousand pounds. After various negotiations, it was bought by the Duke of Orleans for the crown-jewels of France—Louis the Fifteenth was then a minor; hence the name given the stone, the 'Regent'—for two million livres. The value of a livre was about one shilling and fourpence. 'The terms were forty thousand pounds sterling, to be deposited in England before the stone was sent to France, as part payment, of which five thousand pounds was to be forfeited if the sale was not consummated on its arrival there. Governor Pitt, accompanied by his two sons,

Lord Londonderry and Mr John Pitt, and his son-in-law, Mr Cholmondeley, took the diamond over to Calais, and was met there by the king's jeweller, appointed to inspect and receive it. As security for the balance of the purchase price he gave them several boxes of jewels belonging to the crown of France, above the forty thousand pounds already deposited, and promised to pay the remainder in three instalments at periods agreed upon. This amount was never paid, though the French Government admitted the debt when the children of Governor Pitt claimed it, but pronounced it impossible to assume the past obligations of the Regent.' In the inventory of the jewels made by order of the National Assembly in 1791, and drawn up in 1792, its value was estimated at twelve million francs. It was deposited with the other jewels at the Garde Meuble, and their sale was ordered by the Legislative Assembly. The bulk of these jewels, it will be remembered, disappeared after the September massacres, and the 'Regent' was found about a year later in a cabaret of the Faubourg St Germain. It was discovered in a hole made in the timber-work of a garret, and the fact was stated before the Committee for Public Safety. After various vicissitudes, it was redeemed by the First Consul in 1802, and worn by him at his coronation as emperor in the pommel of his sword. Marie-Louise carried off the French jewels in 1814; but they were returned by her father, the Emperor of Austria, to Louis the Eighteenth, who took them with him on his flight to Ghent, but brought them back on his restoration. They were reset on the accession of Charles the Tenth, and remounted at various periods between then and 1870. In August of that year they were deposited in a sealed box with the governor of the Bank of France, and verified in 1875 by a parliamentary commission. Many jewels were sold in 1886 in accordance with a resolution of the French Chamber, but the 'Regent' still remains the property of France, and has been estimated to be worth four hundred and eighty thousand pounds.

Famous, too, are the 'Koh-i-Noor' ('Mountain of Light') and the Timur ruby, which have adorned the English crown for many years. No article on notable jewels could omit mention of the famous 'Cullinan' diamond, found at the New Premier Mine near Pretoria on 2nd January 1905, which was thus named after the chairman of the Premier Company. Its length was four and a half inches, breadth two and a half inches, height two and a quarter inches, and its weight, uncut, three thousand and twenty-five carats, or about one and a half pounds avoirdupois. It was bought by the Transvaal Government for one hundred and fifty thousand pounds, and presented to King Edward the Seventh as a token of loyalty; and no one who has seen the stones (since cut) among the crown-jewels could forget the effect—as of wells of living light.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday*.

LET us recall a remarkable proclamation that was issued just over the borders of France in those tumultuous days at the beginning of last August, when the world gasped as it realised, or tried to realise, that a European war had at last begun. It ran in this way: 'CHILDREN OF ALSACE,—After forty-four years of sorrowful waiting, French soldiers once more tread the soil of your noble country. They are the pioneers in the great work of revenge. For them what emotion and what pride! To achieve this work they have made the sacrifice of their lives. The French nation unanimously urges them on, and on the folds of their flags are inscribed the magic words "Right and Liberty!" Long live Alsace! Long live France!' This inspiring address was signed, 'Joffre, Commander-in-Chief of the Army of France.' That was the first we heard of General Joffre. Not one man in a thousand in this country knew anything before of the General to whom was entrusted the chief command of the allied armies of the west, on whose skill and leadership might depend to a very large extent the fortunes and the future of the better part of the civilised world. Life and magic were in the words of that proclamation. It was peculiarly French in its tone; it did seem inspiring, and to some it looked to be a fine thing that at the very beginning of the war the French should at once be established again in their coveted Alsace. But, as it was very soon proved, they were not established there, and retreats became inevitable. If nothing was known of Joffre until he thus addressed himself to the Alsatians, it is supposed that this first knowledge did not convey the most favourable impression of him to the calmest and most understanding people of Britain. It suggested a highly emotional, impulsive soldier of France, eager for display, with no long view toward a future which was full of difficulty and peril. And whatever may have been the hopes and longings of the French people for the last thirty or forty years, what could Alsace matter in the first movements of this momentous war? But the truth is that all that has happened since has proved to us that nothing could have so much disguised the real Joffre as that proclamation. His first actions and words com-

pletely misrepresented this safe, stolid soldier, so deeply penetrating in his calculations, so sure in his strategy, so sober in his demeanour. We have learned to admire and trust a splendid General. We know him now, and it will be a great day at the end of the war when we see General Joffre riding through the streets of London.

* * *

But there is this to be said for the proclamation, that after all it was a far nobler thing than any that has emanated from the headquarters of the enemy. It embraced something of the Napoleonic spirit. Joffre subconsciously had the great proclamations of Napoleon in his mind when he framed it; and we have now reached to a finer appreciation of the addresses and all the other methods and manners of that great man of more than a hundred years ago than ever we entertained before. He was unscrupulous; but yet in him there was a splendid humaneness, which hitherto some have been slow to perceive or admit, and he at all events was no barbarian. Recently in these pages there were contrasted some of his proclamations to his army with those of the Kaiser; and though it may have little to do with the story now in hand, one or two others are now recalled which are apposite to the circumstances of the times, and may be quoted for a reader's contemplation. Toward the end of April 1796 Napoleon issued a General Order to his army of Italy, from the main headquarters at Cherasco, in the following words: 'All will wish when returning to their villages to be able to say with pride, "I belonged to the conquering army of Italy." Friends! I promise you this conquest, but there is one condition which you must swear to fulfil—that is, to respect the people whom you will deliver. Without that you would not be the deliverers of peoples; you would be their scourge. You would not be the honour of the French people. They would disown you. Your victories, your courage, the blood of your brothers fallen in battle—all would be lost, even honour and glory. As for me, and the Generals who have your confidence, we should blush to command an army without discipline, without restraint, knowing no law but force. I will not permit brigands to

soil your laurels. I shall have executed rigorously the procedure I have ordered. Looters will be pitilessly shot.' It was in the course of this campaign that Napoleon one night, walking anxiously about his outposts, discovered a grenadier, who was sentry, fast asleep by the trunk of a tree. Without waking him, he took the sleeper's gun, and himself performed the duty of sentinel for about half-an-hour, when the man, starting from his slumbers, saw with terror and despair the countenance of the General and what he was doing. In fear and misery he fell on his knees before him. 'My friend,' said Napoleon, 'here is your musket. You have fought hard, and marched long, and your sleep is excusable. But a moment's inattention might at present ruin the army. I happened to be awake, and have held your post for you. You will be more careful another time.' We have heard in this present war what the German officers do with their men, and especially when the officers are pushing them on from behind. The other proclamation was to the army of Egypt two years later, and was issued from the *Orient* just before the disembarkation of the troops. He announced: 'The people with whom we are about to live are Mohammedans; the first article of their faith is: "There is no god but God, and Mahomet is His Prophet." Do not contradict them; deal with them as you have done with the Jews and the Italians. Respect their muftis and imams, as you have done the rabbis and the bishops elsewhere. Have for the ceremonies prescribed by the Koran, for the mosques, the same tolerance which you have shown for the convents, for the synagogues, for the religions of Moses and of Jesus Christ. The Roman legions protected all religions. You will find here usages different from those of Europe; you must accustom yourselves to them. These people treat their women differently from us; but in all countries he who violates is a monster; pillage enriches only a few; it dishonours us, destroys our resources, and makes those enemies whom it is our interest to have for friends.' Is it not that by a strange condition of feeling we now discover our hearts to be warming rapidly towards that Napoleon, who himself indeed made horrors in Europe which are so well pictured in the fiction form of Erckmann-Chatrian's *Conscript* and *Waterloo*, two grim tales that are very well worth reading now? The French have lately issued a cartoon which represents Napoleon, come to life again, standing on the top of his grand tomb in the Invalides in Paris joyously waving his hat above his head, and crying out, '*Vive l'Angleterre!*' and that has also become a popular cartoon in London.

* * *

Joffre, of course, is no Napoleon in ambition, temperament, scope, or possible achievement. He is but a fine General, newly come to great-

ness, and simply doing his duty faithfully to the country that he loves. But yet he has within him something of the spirit of the Corsican master-soldier, and we have seen that he has some of his military imagination too. But though he is a plain soldier, yet he is a great organiser, and a man of fine imperturbability who knows how to wait. He is the man for the situation. That is what we could not realise when we read that first proclamation of his to the Alsatians in the early days of August, which suggested too much fiery ardour, an impulse much too fast for safety. Clearly the proclamation was meant for those only to whom it was addressed, and not for the general reading of other peoples. There are no opportunities now for spectacular generalship in war as there were in the days of Napoleon. Battles, as we have seen, last months instead of hours, and commanders-in-chief cannot direct all the operations going on when astride a fine white horse. Napoleon might quite conceivably have been a failure in the present war. Having such small knowledge of Joffre, let us try to gain a little more. At sixteen years of age he was a Bachelor of Science, and the next year he entered the Polytechnique, the great French military school. When the Franco-German war came on soon afterwards, he quickly made a display of military capacity. As second lieutenant he attracted notice, and was put on to fortification work; and, engaged in this way on the Paris defences, he did so well that at twenty-two years of age MacMahon made him a captain. It began to seem that he might have to pay the penalty for early specialisation, for his work in constructing defences at home and abroad was so good that he was kept constantly engaged upon it. But this was not according to his disposition. He wanted more general experience, and he thirsted for the command of troops. At last opportunity was given him in Cochinchina and the Soudan, and again he did thoroughly well. Joffre took the flag of France to Timbuctoo. He became Professor of Military Construction at Fontainebleau, and then time went slowly and, for an aspiring soldier, somewhat uneventfully on. It was in 1911 that, on the suggestion of General Pau to the War Council, he was placed in command of the French army. At that time even the people of his country had to ask themselves who was this Joffre who had been entrusted with the handling of the great and enormously important French military machine. Joffre was a man who had never advertised himself. He never courted flattery; if he was not insensible to criticism, he gave no sign of regarding it, unless it emanated from the highest quarters. He was always silent and indomitable, and he was intensely efficient. And he has not changed. Before this present cataclysm came on, the French had begun to understand that they had a General for leadership who knew his business

and could do it well; and it was a special qualification that in a war which, it was clear, would be such a war of trenches and fortifications as no other had ever been, he probably knew at least as much about this department of military science as any other living man. He is great in theory, he thinks out in detail, and he presses hard in practice; and while he has the highest faith in his own judgment, and never hesitates to act upon it, he considers always most carefully and sympathetically the schemes and ideas of his chief subordinates, and from each of them may take some trifle for amalgamation with his own. His organisation of his General Staff has been a splendid piece of work. Politics have been the curse of the French army in the past, but there is not a suspicion of political influence at headquarters now. The men who are about Joffre are there because of their qualities as soldiers, and other abilities and disabilities are completely disregarded, with the result that the General Staff is as efficient as it could possibly be. Joffre praises and blames precisely according to the merits of cases; and, while he is fair, he never hesitates at measures of the utmost severity if he considers them to be necessary. So he is liked by the army, and it has confidence in him. It will do as he bids, even when, as at the battle of the Marne, he issued the General Order that the soldiers 'must be prepared to die rather than give ground; weakness will not be tolerated.' Between him and our own General Sir John French there is an excellent and most cordial working arrangement, and Lord Kitchener has described Joffre as a great General and a great man.

* * *

The working day of the Commander-in-Chief of the Allied Forces is generally spent in a manner that is as little spectacular as most other things connected with this war. It is necessary. Only the Kaiser has tried theatricals, and they have not been a success. Joffre has neither a palace nor a tent for his own headquarters, but a room on the first floor of a common sort of house, which is reached by a brick staircase. There are racks on the walls outside the apartment, with officers' cloaks and accoutrements hanging on them. There is a telegraph cable which links up this room with different points on the long line of the Allies' front, with Paris, and the other stations. In the room of the Commander are desks and tables, and easels on which are boards with maps of the European fighting areas, which are continually consulted. Every day there are long consultations in this chamber, old plans being modified and new ones made according to changed circumstances and the reports that come in from the different points along the line and from the aerial and other scouts. This is half the day's work. For the other half, the Commander visits as many

points on the line as is practicable, making his journeys in a large, fast motor-car. Ceremony everywhere is reduced to the extreme minimum. He will take the simplest meal, standing, from a rough bench in the open air, with a few other officers about him. His attire is the most modest. He wears red trousers and high boots, and has a blue cloak about him; and not a single decoration is in evidence. In this respect the Generalissimo might be anybody. Yet, if you did not know who he was, you would suspect on seeing him. Though he is somewhat short and stout, he has features of splendid strength and power. Most of the pictures of him that we have seen in Britain convey a quite erroneous impression, giving him a curly moustache, florid features that are a little puffy, and a rather stupid smile on his countenance such as might suggest that he was just a jolly Joffre. There is nothing of that in the real man. The pictures miss the lines of resolution and decision, the marks of confidence, the strong gray eyebrows knit in thought.

* * *

'The people must have hope and confidence,' says Joffre. 'We shall gain our cause. That is quite certain. We have still a heavy task before us; but the final result can be nothing but victory, and all who fight on our side will share in that victory.' Then again, when he is further timidly questioned about the progress of events and the prospects, he answers, 'Tranquilly! tranquilly! It is a mathematical certainty.' The common idea that the advance of the Russians in the east would compel the Germans to weaken their forces in the west was presented to him for some possible comment, and quickly he responded that he counted little upon this contingency, and cared hardly anything more. 'I am not anxious,' said he, 'that the Germans should weaken their line on our side. As things are, the Russians will advance more quickly, and I can very well look after the enemy on my side. I have him in hand.' Much of what has been written here may seem to have been designed to show that Joffre is not the emotional soldier that the first news we had of him suggested him to be. He is not. But yet behind a plain though agreeable exterior there are some fine emotional simplicities without which no really great man is complete. Months after his first entry into Alsace, Joffre went there again. In the Town Hall of Thann he met some of the dignitaries of the town. He held out both hands as he went forward rapidly and impulsively to meet and greet them, and there was a catch and a hesitation in his speech when he exclaimed, 'Our return is definite, and henceforward you are French for ever. France, who has always represented the idea of freedom, brings with her respect for your own liberties, your own traditions, beliefs, and ways of life.'

I am France! You are Alsace! I bring to you the kiss of France!' They cheered, and in some eyes there were tears. It was a moving scene. But at the finish, when you think of the great Commander of this great fighting machine, directing the operations and shaping the fortunes of the armies of civilisation, think also of the nicest story and the truest that is ever to be told of him. The battle of the Marne had been fought and won. Joffre was apparently

unmoved. 'Do you know, General,' said one of his staff, who thought it strange that at such a time a victorious commander should not almost sing and dance—'do you know that you have won what is perhaps the greatest battle in history?' Joffre looked calmly and reflectively upon him for a few moments, and then he answered, 'What I have won, I hope, is a right to rest the sooner in my little house in the Eastern Pyrenees.'

THE BRIGHT EYES OF DANGER.

CHAPTER X.—IN THE TIDAL CAVE.

THE dawn was close at hand. A faint lemon streak of light, scarcely discernible, showed against the little barred window, and once I thought I heard a far-off cockcrow, the only sound other than the one from underground that I had heard since my captors turned the lock in the door. Would the day never come? Was I to sit there (for all desire for sleep had vanished) impotent and humiliated, like a jail-bird waiting a turnkey? Indeed, a cutpurse would in one view be in better case, for he would know the charge against him, and be given a decent trial and a chance of his neck. I tried the door, the walls, the window, the floor again; but they yielded no hope, and I sat down again on the couch in a sullen temper.

Just at this moment, with the suddenness of black magic, came the Apparition. But for it this tale might never have been written. I might not have been here to write it, and at the least it would have taken very different shape, for I should never have seen certain happenings that altered my life's current, and that often seem to me, looking back on them from this distance of time and place, to have been as fantastic as scenes from play-acting. I had been staring into the middle of the empty fireplace, when I slowly realised that there was Something there—a thing daunting and alive that had come without a footfall. In the half-light I could only make out a motionless gray blur. Out of it stared a pair of great dark eyes. The Thing was not human. It had no tail, or only the merest shapeless semblance of one; and the plain truth is (so much do darkness and silence sap a man's heart) that, to my shame, I could not speak to it. It stared with great unblinking eyes at me, without a movement; and there I sat glowering back at the gruesome Thing. How long we stared at each other I cannot say, but my courage had time to warm. Just as I was making up my mind to hurl the chair at it a streak of light slanted from the window, and, lo! the horror resolved itself into a poor barn-owl! It had strayed in its night-hunt down the chimney, and was regarding me with an in-

describable air of solemn perplexity! The affair was so ludicrous that in the reaction I broke into a cackle of laughter, and in a twinkling he was out of sight and up the chimney with a single soft sweep of wings. But the owl's coming gave me an idea. Where he came in I might perhaps go out.

I took the candle and examined the fireplace. It was huge and old. There were a few dry sticks on its flat stone surface, but it was plain that no fire had been kindled in it for a long time. I stooped and peered into it. The chimney was narrow and impassable; but from the left there came a light current of air, enough to flicker the candle-flame, and with it the very faintest smell, one that I knew after a sniff or two to be sea-water. I went on my knees to look through the crevice where the current of air entered, resting my free hand on the masonry. To my surprise, it moved slightly. I ran the candle over the stone-work, and discovered that it was a single long slab, a flagstone, and (a thing significant and a spur to my curiosity) the crevice was not accidental, but cut away by design. At first I thought it might have served as a spy-hole or a channel for the passing of letters or the like; but when my fingers slipped into it, in a trice I knew its use. It was a handle. I laid down the candle, gave the stone a steady pull, and slowly but easily it came away into my arms, admitting a puff of cool wind that nearly blew out the candle. I placed the big flat stone (it was about three feet square) on the fireplace, and climbed cautiously over the lower half. This proved to be stout enough to bear me; and, my foot touching the ground on the other side, I found myself in a little tunnel or passage, made by man's hands, for there were a couple of beams in the roof and the ground had been rudely turfed. The room I had been shut up in had, in all likelihood, I thought, been a 'priest's hole,' a hiding-place in some old Catholic house. The tunnel was barely high enough to allow me to stand upright; but after half-a-dozen yards it became higher and wider, and soon opened out to a natural chamber, with rock walls and roof,

and the ground a mixture of wet sand and shingle. Here it was that the mysterious regular sound came from, for as I stood looking about me there was a slow rumble, and a sudden splash of water from a V-shaped opening about ten feet from the ground in the straight rock-wall of the little cavern fell down with a crunch to the shingle below. I was so near that the spray wetted my face. The tide had been coming in, and must have been at the full when I heard the steady, regular beats in my cell. I guessed that the sea ebbcd and flowed outside in some gap in the rocks. I could hear the retreating waves snarling on the shingle. Then the loud voice of the tide filled my ears again; the vault I stood in trembled; down came the overflow with a splash on the ground, to boom in reverberations round the roof, followed by quiet as the spent wave retreated. I waited until the next splash—a mere handful as the wave's force weakened in the ebb—had fallen, and examined the face of the wall of rock. It was almost perpendicular, but there were three footholds. Plainly the opening at the top had been used as an exit. Giving the tide time to ebb a little farther, with luck I thought I could clamber up, and see the sky and freedom again. So I sat me down on a little boulder, and waited in great impatience. I was giving myself congratulations on my doings, when my thoughts were cut short and my heart sent drumming by the sound of a footstep. It was faint, infinitely cautious, and slow, but unmistakable. Whence it came I could not make out, but it seemed to be in the very heart of the rocks around me. It was coming slowly and stealthily nearer, nearer, and at the sound of it I confess the sweat froze on my spine, for I had little doubt of my fate were I caught attempting to escape.

Early morning light was struggling through the opening, so that I could see fairly well. A pool of shadows lay in a corner out of the gathering daylight, and into it I stepped with the utmost quiet, and stood listening, all my senses on edge. Presently there came a sound of something being scraped or pushed; and, looking high up to the left, I saw for the first time another opening, and the end of a narrow ladder being gently lowered from it. A foot sought one of the ladder's rungs, and a man, his back towards me, stepped slowly, softly, down to the ground. There was a curious deliberation in his gait, an over-anxious precision of movement such as one sees in the very old or feeble. It puzzled me, for it was at complete and startling variance from his appearance. He was very tall, standing six feet and three inches at least, massively and co-ordinately built, wide-shouldered, and, so far as I could judge, in late middle life; a man of noble, outstanding presence, with clean-cut features and a crop of coal-black hair on head and chin. A great red

scar ran across his forehead, and his eyes were large, full, and very dark. My heart sank at the sight of his physique, my hopes of escape vanishing, for I saw that I should have little or no chance in an encounter with him. He stood perfectly still, listening, the light full on his fine face, one hand fluttering curiously in front of him, the other leaning on a great staff. He took two soft steps forward, his free hand gently beating the air in front of him. I watched him breathlessly. Suddenly I felt a sense of relief, and together with it a great pity; for, although his eyes were open, the man was blind! Yet the eyes that could not see pierced me like a fire, in the black depths and glow of them. They travelled slowly over the cavern, round and round to roof and floor, and over the wall, sightless, but in the pitiable intensity of their gaze seeming almost to seize and comprehend. Once they lighted on me. We stood, our eyes full on each other, in the tense silence, and for the life of me I could scarce keep from calling out to him. To outwit a blind man seemed a paltry business, and I had little heart for it; but in the light of what happened afterwards it was as well that I did not speak or stir, for, without my seeking, I found a key that turned the lock on treachery and the blackest double dealings.

He was now in the middle of the place, extreme caution in his attitude, listening intently, holding his breath. A pebble, dislodged, perhaps by himself, fell with a little rattle from the opening. Instantly he swung his great staff twice clean round him, making the air hum. The slash of it would have laid a man senseless. He listened again, frowning; and, apparently not even yet satisfied as to the emptiness of the cavern, began a systematic search round the walls, feeling them with his hands. I was but a few yards from him, and as soon as I saw his plan I lowered myself with the utmost quiet to the ground, and lay on my side as close against the rock as I could. He came nearer, touching the walls with his quick nervous hands, and for a dreadful moment I thought I was discovered. His foot was within an inch of my face; but he passed on until he came to the tunnel that led to my room, and stood listening there.

Evidently reassured, he came back, took off his coat, and turned up his sleeves, showing wrists and arms as white as milk. Tiptoeing to a boulder (the very one that I had been sitting on), he went down on his knees on the wet shingle, and turned the stone over with easy strength. His broad back was to me. I could not see what he was about, and I dared not change my position, for the incident of the falling pebble had advertised the man's hearing, like most blind people's, to be abnormally keen. He seemed to be burrowing and scraping in the sand with his hands. Soon he straightened himself, and his sightless eyes

travelled round the room. Taking a packet from his breast, he bent himself over his task again. This took him but a moment or two, when he stood up and replaced the boulder with great care and exactness, stooping down and filling in the sand around its foot. Going below the opening, he sighed wearily, a great depth of sadness in his sightless dark eyes, and stood there, chin on breast, a strange and sorrowful figure, listening to the rumour of the sea. Then he drew on his coat again, and lifting his great staff, groped his way up the ladder, drawing it noiselessly after him, to disappear through the narrow opening. In a few seconds all was silent again. Was I dreaming? Was the scene real? But there was the boulder to speak for itself, and the remembrance of the man's search along the walls, his great scar and dark haunting blind eyes, clung about me like a live thing.

While I was lying watching his uncanny quartering of the little cavern, the light had been slowly gathering. The inmates of The Garth might soon be astir. I bent to the boulder, and heaved at it with all my might. My muscles were as strong as the roots of trees; but I sweated before I shifted it from its place. Assuredly, if the tall man was blind as Samson of old, Samson's strength was his. Loose wet sand underlay the boulder, and in a trice I dug out of it, buried a foot deep, a little cylindrical packet, half the thickness of a pack of playing-cards. I was on the point of pocketing it, when I hesitated, for there was something in the man's bearing, so sad, so sorrowful, a prayer almost in his eyes as he stood listening, that the thought of filching the packet from this man with the haunted look filled me with something near shame. A makeshift, an easement to my conscience, presented itself. There would at least be no harm (so I argued) in looking inside the packet, and then returning it to its hiding-place. It must hold something to raise the eyebrows to be hidden in such a place, visited at dead of night with such solicitude and with every circumstance of stealth and secrecy. So, satisfying my curiosity and my conscience by this compromise, I slipped the packet into my pocket.

The sea was still muttering outside, and every now and then shutting out the light with a splash. I could not escape by its entrance. If any one visited the room I was supposed to be a prisoner in, there would be a hue and cry, and I should be trapped like a rat in the cavern. There was not a moment to lose. I made up my mind to go back to the room until the tide had ebbed somewhat, and, as soon as might be, return to the cavern and find out if escape were possible through the V-shaped opening.

I hastened back quickly on tiptoe, climbed into the fireplace, replaced the flagstone carefully, and listened. Not a sound came from the house.

The packet was tied securely, the knots taking me some time to unfasten. It was of coarse stuff like sailcloth, coiled tightly, so that it formed a compact little roll about the length of two fingers. Unwinding it, I found a single piece of paper at its heart, and nothing else. I smoothed the paper out and took it into the light. It was stained as if by damp. One side was blank, but on the unstained portion of the other there was something written in the bold and angular hand of a man.

I held the paper up to the light, and had just made out the rough drawing of a ship, when the sound of movements in the house reached me. A door closed somewhere, and I heard the dog bark once. Slipping the wrapping and paper below the couch, I lay down, covered myself with the plaid, and closed my eyes. I was not a moment too soon, for a step rang on the stone corridor outside my door. There was a rattling of keys, and a Gaelic servant entered, a pistol in one hand, and a spoon and platter in the other. I feigned waking with a start, and sat up, rubbing my eyes sleepily. Never a word of good-morning gave he, but laid down the spoon and platter, glancing at me now and then from the corner of his eye.

He returned bringing a bowl of porridge and milk, a dish I never favoured. There are certain savage tribes (I have been told) who, when short of food at war or on the hunting field, have trained themselves to swallow earth, thereby contriving to exist a little longer than their neighbours. This I am afraid was, and is, something of my attitude towards porridge—a dish to be accepted only when the worst comes to the worst. But the day promised to be one of action, and to set out breakfastless for work or play puts little heart in one. So I fed, the man watching me. Although the stuff was ill-cooked, burnt, and coarse, there was plenty of it. Between the spoonfuls I contrived to enlist the man in conversation, for I had a plan in my head. I wished to copy the paper I had found, and I had no means to my hand for doing this; and I wished also to find out if the dwellers in The Garth knew the secret egress from the fireplace. It was probable that they did not, else they would never have chosen this room for my prison; but I was anxious to make certain of this.

I engaged the surly-looking dog with a remark about the weather.

'Tis a cold morning!'

He gave a boorish grunt.

'I have been shivering here in the dark all these hours,' I went on between spoonfuls. 'If I am to be kept here, the least your mistress can do is to light me a fire. The draught from that great chimney sets my teeth chattering.'

He never gave as much as a glance at the fireplace.

'Fire!' he repeated. 'Fire!' I might have

been asking him for his ears, there was such an accent of surprise in his voice.

'Yes, a fire. It is no great luxury. Had it not been for the candle I could not have had even the comfort of tobacco.'

His countenance almost brightened at the word 'tobacco.' 'Ah! you smoke. It is a good sing a smoke,' he said meditatively.

'It is indeed,' I agreed.

'A smoke is a ferry goot sing, and sneeshin' is a good sing too.'

I had no notion of what 'sneeshin' was, but the man's eyes wandered back to my tobacco-box on the table like a child's to a bauble; and, in truth, although great bearded fellows and men of their hands, I discovered that numbers of the common order of Highlanders were very children for simplicity in many ordinary matters.

'Yess,' he repeated, nodding his head as if pleased with the refrain, 'it's a good sing a smoke.'

I pushed the tobacco-box towards him.

'You are welcome. It is the finest grown in the plantations.' (In truth it was vile stuff that

I had bought from a huckster in the Lucken-booths.) He took the box without a word, and promptly put a large chunk in his mouth, where it bulged like a nut in a baboon's cheek.

'It is goot,' was his verdict, his jaws moving. 'It is shentleman's tobacco.'

'You can have the whole of it if you carry a message to your mistress. Say to her that the gentleman wishes a fire and a pen and ink.'

His face creased in a sly smile.

'I will be having the tobacco first?'

'Certainly. A bargain is a bargain.'

I handed him the box, and he emptied it forthwith into his pocket.

'Now take the dish away, and remember the message: *A fire and pen and ink.*'

Had I tried to wheedle him I might have failed; but I made an order ring in my voice; and the servitor, used to obedience and mollified by the tobacco, took up the dish, and repeating the words '*fire—pen—ink*' over and over in a kind of silly chant, went out, locking the door behind him.

(Continued on page 181.)

BENJAMIN DISRAELI, EARL OF BEACONSFIELD.

PERSONAL NOTES.

By Sir HENRY LUCY.

MY opportunity of studying Disraeli at close quarters dates eighteen years later than the period of his history reached in the third volume of his Life, just issued from the Press. In 1872 I entered the Press Gallery of the House of Commons as summary-writer for the morning edition of the old *Pall Mall Gazette*, under the editorship of Frederick Greenwood. Thereafter, till, four years later, he walked out of the House for the last time, I saw him daily through successive sessions. Acquaintance was renewed when he went to the House of Lords, but not under equally interesting circumstances.

Between 1868 and the close of the session of 1873 Disraeli was leader of the Opposition, faced on the other side of the table by Gladstone, whose animated oratory he genially touched upon, publicly thanking God that between him and the right hon. gentleman there interposed 'a substantial piece of furniture.' He was still handicapped by the distrust and personal dislike with which at the outset of his career he was regarded by blue-blooded Tories. They accepted his services because there was none other capable of rendering equal value; but they would gladly have got rid of him, setting up in his place one of their own caste and cult.

In 1873 he sorely tried the faith and patience of his followers. By a cabal among his own party hostile to the Irish University Bill, Gladstone was placed in a small minority, and resigned

the premiership. To the angry resentment of disappointed place-hunters, Disraeli declined to undertake the conduct of the Government in the existing House of Commons. Pressure was put upon him to induce him to alter the determination. He stood firm, and in an eloquent passage, spoken in voice rarely broken, defended himself from attacks made from the rear and on his flank. 'Sir,' he said, unconsciously echoing a well-known passage in Peel's speech when driven from power by coalition between Protectionists, Radicals, and Irish members, 'when the time arrives, and when the great Constitutional Party enters upon a career which must be noble, and which I hope and believe will be triumphant, they may perhaps remember, I trust not with unkindness, that I prevented one obstacle from being placed in their way; that I, as the trustee of their honour and interests, declined to form a weak and discredited administration.'

His prescience was vindicated by the results of the General Election which took place in the following year, landing his party and himself at the head of affairs with a majority that for the first time in his political life endowed him with untrammelled power.

On one other occasion only have I seen temporarily fall the mask his countenance habitually wore, earning for him the cognomen of 'The Sphinx.' It happened at the funeral of his wife, who died at Hughenden in December

1872. Self-possession and immobility of visage had served his purpose at many crises of his marvellous career. Both broke down as he stood by the grave of the woman who had devoted to his service the greater part of her life and the full measure of her worldly wealth. Had an artist desired to produce a representative face of Woe he might have sketched Disraeli's, and presented it without addition of fancy touch. Regardless of heavy rain, he walked bareheaded from the manor house to the church, and stood for full ten minutes in the sodden grass by the open vault, the December wind playing with his suspiciously dark hair.

Whilst the coffin was being lowered into the vault he never took his eyes off it, regarding it with steadfast, pitiful, almost hungry look, as if he grudged the grave its custody. When it reached the bottom of the vault he seemed to fall into a sort of trance. It was only after his faithful secretary, Monty Corry, afterwards Lord Rowton, nudged him twice that he awoke with a start, and took in hand the wreath he was to drop on the coffin-lid. To one accustomed to his manner in public life this was a revelation of an unsuspected man.

Disraeli's advent to the premiership after the General Election of 1874 transmogrified the House of Commons. The assembly dispersed by the dissolution was built over a seething volcano. Crises more or less serious were of weekly occurrence. At the incoming of Disraeli the scene changed as by magic. With instinctive dramatic art he assumed an attitude and manner in marked contrast with the feverish haste of his predecessor. Silent, impressive, almost sombre in mood, he remained through a sitting, rarely interposing save in response to questions personally addressed to him.

In these days the measure of attendance Ministers spare for the Treasury Bench in the House of Commons would have shocked Disraeli. The modern custom is for the whole body, save the one concerned in the business immediately before the House, to disappear as soon as questions are over, retiring to their snug private rooms, hurrying back only to vote at signal of the division bell. Disraeli not only sat through a debate, however comparatively unimportant, but expected his colleagues to keep him company. Shortly after the Speaker took the Chair he arrived, and dropped into his accustomed seat opposite the brass-bound box, where, with brief interval for dinner, he remained till the Lobby echoed the cry of the doorkeeper, 'Who goes home?' Ever as he took his seat there was precisely the same minute disposition of his person and his apparel. Having draped the tails of his frock-coat over his crossed leg, he folded his arms, bent his head, and hour after hour sat immobile. If any thought he slept they were mightily mistaken. His eyes, bright to the last, furtively surveyed the enemy's camp, always

returning to the bench opposite if Gladstone happened to be in his place. He habitually dined in the House, wherein he again differed from the custom of modern Prime Ministers, notably Mr Balfour and Mr Asquith.

Unlike Gladstone, he rarely entered into conversation with colleagues seated near him, an exception being made in the case of Lord Barrington, Vice-Chamberlain of the Queen's Household. Occasionally, towards the close of dull sittings, when Barrington gaily chatted to him, the grim visage would be literally distorted by a smile. Like Chamberlain, Disraeli wore a single eyeglass, differing in respect that, whilst the former favoured a rimless monocle, the latter had his glass slung on a long black cord. One night I observed him in a state of unusual perturbation. He had dropped his eyeglass, and no excursions in the neighbourhood of his waistcoat and shirt-front were successful in retrieving it. Barrington found it hanging down his back, and made his chief instantly happy by its restoration. Before he died, Disraeli elevated his old Treasury-Bench crony from the position of an Irish lord to a peerage of the United Kingdom. Peevish persons asked what he had done to merit this high reward. I remembered the successful search for the errant eyeglass.

Early promise of aptitude for the position of leader of the House of Commons was fulfilled throughout Disraeli's first session. At no period of his career did he rise to higher level as a parliamentary speaker; whilst old members, recalling Palmerston in his prime, agreed that he was not excelled in the special quality of managing the House. Not in the zenith of his popularity, after the election of 1868, did Gladstone approach his ancient foe in the matter of personal hold over the assembly. The last two sessions he lost it with pitiful effect, as in the matter of the Radical revolt that threw out the Irish University Bill. Disraeli's studiously slow rising from the Treasury Bench in the course of debate, and the deliberate opening of his speech, signalled instant filling up of the benches, and that steady settling down to an attitude of attention which is the highest compliment that may be paid to a speaker.

A marked difference between the bearing of Disraeli and his predecessor was shown during the intervals of debate occasioned by divisions. Gladstone on going forth with the crowd to record his vote usually carried with him a sheet of note-paper and a blotting-pad, with intent to utilise the ten minutes or quarter of an hour occupied by the division in getting forward with his correspondence. Failing that, he strode through the Lobby with his nobly shaped head in the clouds, recognising no one, an unconscious habit that more than once, to my knowledge, had the effect of estranging valuable supporters.

When the division bell rang Disraeli also made off to the Lobby in the first flight of

members. But his purpose was other than the prosaic one of writing letters. During the winter months there was set in the Lobby a particular fire before which he stood, apparently intent on nothing more important than comfortably warming himself. But his keen eye was bent on the passing throng of his supporters. Lord Rowton once told me that before leaving Downing Street to go down to the House the Premier possessed himself of the half-sheet of notepaper on which the faithful secretary had jotted down the names of one or two men with whom, for varied reasons, a few minutes' friendly conversation was desirable. As one passed Disraeli signalled him with friendly nod, and when it was time to move on to the wicket this harmless, apparently accidental, chat had unravelled a coil which, left unnoticed, might have critically hampered the machinery of the Government.

The course of public events never brought into nearer or more striking juxtaposition two men so absolutely opposed to each other as Gladstone and Disraeli. One was intense, earnest, thorough; the other indifferent, polite, superficial. When Chancellor of the Exchequer, Gladstone would as readily have made a joke as add a penny to the income-tax. Disraeli, with equally light heart, did either as chance befell. It is not an insignificant thing that whilst one frequently heard pronounced the opinion that Gladstone had made a great speech, the adjective was never used in commentary on Disraeli. His speeches were spoken of as clever, as distinguished from being great. In a general way the adjective may be adopted as describing the leading characteristics of the two statesmen. One was great with the full force of lofty moral character and supreme intellect; the other was clever, great only in the sense that his cleverness was superlative.

Disraeli's success as a parliamentary speaker was varied. At his best, presented in the shorter speeches, he was incomparable. As a phrase-maker who could, with a combination of two or three words, label—to some extent lame—an adversary for life, he had no equal. His passion, rarely indulged in, always seemed feigned, its effect being funny rather than tragic; but his polished shafts of sarcasm, his feathered darts of wit, his dainty gilded bullets of irony, flew about the House, and never missed their mark. This gift he retained to the last. Circumstances being increasingly prosperous, his manner became more benign.

Of all his conquests over former enemies none was more unexpected and complete than that

obtained over Queen Victoria. The Prince Consort shared in extreme degree the prejudice existing among British gentlemen of the mid-nineteenth century against one whom they regarded as a Jew adventurer. The Queen, who devotedly shared all her husband's likes and dislikes, fought hard against Lord Derby's proposal to include Disraeli in his first administration. A quarter of a century later, Disraeli, in conversation with a friend, disclosed the secret of his ascendancy in royal favour. 'When talking with the Queen,' he said, 'I observe a simple rule of conduct. I never deny; I never contradict; I sometimes forget.' The inevitable contrast with his great rival came in when he added, 'Gladstone speaks to the Queen as if she were a public department. I treat her with the knowledge that she is a woman.'

On the 12th August 1876 the House of Commons was not a lively place to look upon. It was the last working day of a session prolonged and exhaustive. The Appropriation Bill stood for third reading, and Sir William Harcourt did not shirk the opportunity provided by the occasion to attack the Government on their foreign policy. Defending it, Disraeli finished up with some bristling words calculated to call forth a cheer from good Conservatives. 'Our duty at this critical moment,' he said, puffing out his cheeks and beating the air with his hands, 'is to maintain the Empire of England. Nor will we ever agree to any step that may obtain for a moment comparative and false prosperity that hazards the existence of the Empire.' These were the last words spoken in the House of Commons by Benjamin Disraeli.

It was nearly eleven o'clock when he resumed his seat. There remained only some formal business to be accomplished in preparation for the ceremony of prorogation. Amid the buzz of conversation, Disraeli rose and strolled towards the Bar. I wondered as I watched him. His custom, common to all Ministers, was to seek egress by the door behind the Speaker's chair. Now he slowly paced the length of the floor between the two political camps. Turning when he reached the Bar, he made low obeisance to the Speaker. He stood for a moment gazing round the House, and, turning again, walked out through the glass door. With the exception of one or two Cabinet colleagues, no one looking on knew that a momentous episode in the annals of the House of Commons was closed. The morning newspapers betrayed the secret. Disraeli was no more. In his place only the Earl of Beaconsfield.

PRIVATE WASSERMANN'S COUNTRYMAN.

A STORY OF THE FOREIGN LEGION.

By VERE D. SHORTT.

PRIVATE WASSERMANN of the Legion halted at the corner of the Rue Thiers in Sidi-bel-Abbès, and adjusted his blue woollen sash, using the window of a shop as a mirror; then he cocked his *képi* at a slightly jauntier angle, and resumed his promenade. He was a tall man, broad and well set up, with a great yellow beard flowing over his tunic, and a pair of mild and introspective blue eyes. Even to a casual observer it was plain to be seen that Private Wassermann was no Frenchman. Blue capote, scarlet trousers, and *képi* were French; but the eyes and beard were German past all doubting. Not that that would at any time occasion remark in Sidi-bel-Abbès. The good bourgeois of that town are used to seeing many strange types and men of many nations in the uniform of the French Republic, for Sidi-bel-Abbès is the headquarters of the First Regiment Étranger, and that force asks no questions as to a man's nationality, or yet as to his past. Whatever or whoever a man may have been, once in the Foreign Legion he is simply a *légionnaire*—one of the ten thousand lost sheep who guard France's desert outposts, and who, German or French, noble born or peasant, all come under the same iron discipline which welds the Foreign Legion into the magnificent force it is.

Private Wassermann was feeling far from unhappy. He had three or four hours' liberty to look forward to, he had a packet of rank Algerian cigarettes, and he had also a most noble thirst. In the right-hand pocket of his baggy red trousers reposed the sum of five *sous*—his pay for the last three days—which would buy him two litres of fiery Algerian wine, and under the circumstances Private Wassermann felt that everything was for the best in the best of all possible worlds.

The only fly in his ointment of life was that his comrade, little Rossi, the Italian, was at present undergoing a course of *boîte* (cells), and that therefore he (Wassermann) could not satisfy that noble thirst of his (which was increasing momentarily) until he found some one to take his absent friend's place. By far the strictest of the many unwritten laws of the Legion is that which forbids a man to *faire Suisse*, or drink alone, under any circumstances. Wassermann was an old legionary, and the Legion customs were second nature to him; and consequently, as he strolled along the Rue Thiers that hot afternoon, he kept his mild blue eyes very wide open in the hope of seeing an acquaintance—a more or less solvent acquaintance. The more Wassermann thought about

it the surer he was that his three days' pay was just enough, and no more than enough, for his own thirst. If he met a comrade who was *décavé* (broke), well, then, the two litres would be just enough to make the two legionaries want more, and there was no saying what might happen then. There were Jews in Bel-Abbès who would buy a legionary's sash or bayonet—at a price; but Wassermann had had dealings with them before, and had come to the conclusion that the game was not worth the candle. Thirty days of prison for disposing of one's kit is a longish price to pay for the most satisfactory carouse. No; he must keep his eyes open for some one who had not spent his pay yet. Then, when Wassermann's wine was finished, his companion would buy some more, etiquette would be satisfied, and so would two thirsty soldiers of France.

But Wassermann apparently was not in luck that afternoon. The few comrades he saw were notoriously improvident souls, and he did not consider himself justified in taking the chance of their being in funds. He was seriously considering the advisability of returning to barracks and going to the canteen, when a civilian crossed the street and addressed him.

The stranger was a stout and comfortable-looking personage, with a yellow moustache brushed fiercely upward, so that a point rested underneath each eye, and in type was Teutonic, but in a different way, as was Wassermann himself.

The new-comer raised his hat. '*Pardon, monsieur*,' he said, 'but would you be so very kind as to direct me to the barracks? There is a friend of mine at present serving in the Legion, and as I am not staying long in Bel-Abbès, I would like to see him before I leave.' His French was very good; in fact, it was only by a slight guttural quality and a certain thickening of the labials that one could tell that it was not *French* French.

Wassermann brought his hand to the peak of his cap in reply to the other's salutation. 'Up the hill there, *mossieu*,' he answered. Again it was to be noted that Wassermann's accent closely resembled that of the stranger, and the latter seemed to notice it, too.

'Ah,' he observed, 'you are German, are you not?'

There was a momentary flicker in Wassermann's blue eyes. Then he smiled. 'German, *mossieu*?' he replied. 'I was. Now I am a legionary.'

The other laughed. 'Oh, once German, always German, *nicht wahr*?' he said. 'And I—I am

German also—Heinrich Grosskopf of Hamburg, traveller in hardware, at your service. And you, my friend, what part of the Fatherland do you come from?’

Wassermann made a vague gesture. ‘From the Fatherland—yes,’ he said, and again a close observer would have noticed that flicker in his eyes.

But Herr Grosskopf seemingly was not a close observer. He patted Wassermann on the shoulder. ‘It is good to meet a compatriot so far from home and in this *schweinhund* of a country,’ he said jovially; ‘and now, the day is hot, and perhaps you will allow me to offer you some refreshment, Herr —?’

‘Wassermann,’ replied the other. ‘*Private Wassermann of the First Étranger.*’

But Herr Grosskopf did not appear to notice the correction. ‘Quite so, Herr Wassermann,’ he remarked, ‘an honest German name. Well, Herr Wassermann, there is a *café* I have discovered here where they keep a good brand of Rhine wine, better than this filthy Algerian stuff—*nicht wahr?* And if you will honour me by sharing a bottle!’ and he took hold of the other’s arm affectionately and led him down the street.

Somehow or other Herr Grosskopf did not look very like a traveller in hardware. The German, while he is doing his service, is one of the most military-looking people it is possible to imagine; but once he retires into civilian life he is rather more than apt to shed the stiffness of the barrack-square, and take on a certain embonpoint and slouchiness in its place.

Herr Grosskopf’s lower chest was certainly well developed, but the slouchiness in his case was absent. His back was as straight and stiff as if his spine were formed of a rigid bar of iron, and his blue eyes were very wary and alert. In fact, to any man who had lived among soldiers, Herr Grosskopf had ‘soldier in plain clothes’ written large and plain to read all over him.

The two entered a small *café* in a by-street off the Rue Thiers, and when they had seated themselves at a table Herr Grosskopf ordered a bottle of Rhine wine, and after it had been uncorked and set before them, filled his companion’s glass and then his own.

The two men clinked glasses and drank, and Herr Grosskopf refilled them, and produced cigars, and he and his companion settled down to a quiet chat.

For a traveller in hardware, Herr Grosskopf took an amazingly intelligent interest in military matters, and especially in those which had to do with his companion’s regiment. Did the Legion get much active service nowadays? He supposed that the great majority of the men were French? Oh, there were many foreigners! Really? Many Germans, for instance?

Private Wassermann, for the first hour or so, was not a communicative companion. He

applied himself steadily to the Rhine wine and the strong Hamburg cigars which his new friend pressed on him, and returned polite and non-committal answers to his questions; which questions, as the contents of the second bottle grew lower and lower, became more and more of a leading nature.

However, just after the glasses had been refilled for the first time from the third bottle, Private Wassermann grew more communicative, and as the rest of that third bottle drew towards its end opened his heart to Herr Grosskopf.

Yes, it was true that there were many Germans in the Legion. Were they well treated? Was *any one* well treated in that accursed corps? No; the Legion was a dog’s life; and as for the time an honest German had in it—well, Private Wassermann’s tongue could hardly describe it. Would Herr Grosskopf believe that their great and good Kaiser was made a subject of mockery by Frenchmen in the barrack-rooms, and that a word of protest against this blasphemy was visited by brutal punishment? Only last week he, Hans Wassermann, had spent three hours *en crapaudine* for having rebuked one of his comrades for this crime. *Crapaudine*? Oh, *crapaudine* meant that a man was stripped naked, tied wrists and heels, and left in the sun to meditate. This was quite a mild punishment for the Legion. So overcome was Private Wassermann by his own woes and those of his compatriots that it took all that was left of that third bottle of excellent Rhenish wine to restore him, and even then his face was flushed and his eyes were shining with the thought of his wrongs.

Herr Grosskopf nodded gravely, and then leant forward and spoke to his companion in a low voice. ‘See now, my friend,’ he said, ‘it makes my heart bleed to see men—and especially German men—living such a dog’s life. Now, could not you and some others—let us say all the Germans in your company—make a bid for freedom? It ought not to be difficult, supposing you had friends, or even one friend, who was ready and anxious to help you.’

Private Wassermann regarded his companion gravely and sadly. ‘No,’ he admitted, ‘it might not be difficult—with aid from a friend. But where to find one, *mossieu*? One only finds such friends in heaven,’ he added piously.

Herr Grosskopf leant still farther across the little marble table.

‘It is easy to see that you are a man of the very greatest intelligence and daring, my friend,’ he said. ‘Now, suppose I told you that I—Heinrich Grosskopf of Hamburg—was ready to help you. Listen. The Fatherland wants all its sons. It is time that the French cock had its comb cut, and who can do it better than Germany—*our* Germany? Have you forgotten ’70?’ (Here Private Wassermann’s eyes flickered again.) ‘Come back to the Fatherland, and I

promise you, for your comrades and yourself, that if there is anything to be forgiven, it shall be forgiven. I give you the Emperor's own word for that.'

Private Wassermann appeared impressed but doubtful. 'But,' he said, 'it will not be easy. Those French keep a close eye on us legionaries. Also, it will take money—*much* money,' he added thoughtfully.

From the sympathetic companion Herr Grosskopf became the man of business in a moment. 'And what might you call much money, my friend?' he inquired.

Private Wassermann became explanatory. 'It will be necessary to provide plain clothes for those men who will come,' he said; 'also, it will be necessary to buy them wine. They will have to talk together and consider matters, and a little wine helps men to make up their minds. With our miserable pay, you understand, *mossieu*'—and he spread his arms abroad.

Apparently Herr Grosskopf did understand. He produced a purse from his pocket, and from it produced two twenty-franc pieces, which he pushed across the table toward his companion.

Wassermann's hand closed on the coins. 'That will be enough—for to-night,' he added, as he noticed the look of relief on Herr Grosskopf's, by this time, rather flushed face. 'See now, *mossieu*. To-morrow night at nine o'clock be outside the barrack gate, about fifty yards away. I shall be there—I and some of my comrades, and you can talk with them. Now, *mossieu*, I must say good-evening, and *auf wiedersehen*. Many thanks for your pleasant company and the good wine!'

Private Wassermann drew himself up very straight, adjusted his belt and *képi*, and with a salute to his companion turned into the street, walking with the awful precision of a man who has the best part of three bottles of wine under his belt.

As soon as he turned the corner Private Wassermann halted, and, with a lamentable disregard of all the canons of good taste and in defiance of the bylaws of Sidi-bel-Abbès, expectorated on the pavement. '*Salé cochon d'un Prusse!*' he remarked 'gravely to the air, and went on his way back to barracks.

At nine o'clock the next evening Herr Grosskopf was in the Rue Bugeaud, where it runs beside the barrack wall. Herr Grosskopf was feeling very satisfied with himself. Even if ten or fifteen of the Legion could be induced to desert (if possible with violence toward their officers thrown in) it would make a considerable stir. Of course, if they could be got clear away so much the better; no one knew better than Herr Grosskopf what deadly need the Fatherland was going to have of all its sons at no very distant date; but even an unsuccessful attempt at wholesale desertion would give the authorities

something to think about. If the men did get away—well, once they were back in the Fatherland, the lamentably slack and unsoldierly manners which prevailed in the Legion could easily be knocked out of them by the methods peculiar to that fine flower of chivalry and military virtue, the Prussian officer. Perhaps, if Providence was very kind to himself (Herr Grosskopf), he would be able to take a hand in the breaking-in process. At the very thought his back stiffened and his moustache bristled more fiercely.

Then from the shadow which the barrack wall threw on the moonlit road came a low whistle, and a figure detached itself.

Herr Grosskopf stepped forward. 'Ah, my good friend,' he said, 'and so you have come. And your friends?'

Wassermann nodded. 'My friends are just down the road, *mossieu*,' he said quietly.

Herr Grosskopf clapped him on the shoulder. 'All good Germans?' he queried.

'All good Germans,' repeated Wassermann, 'as I am German—German from Colmar in Alsace, *mossieu*! No; keep your hands out of your pockets; and there was the *whEEP* of quickly drawn steel as his long Lebel bayonet came out. 'That's better. Now, *mossieu*, I want to have a few words with you. Ten years ago I was in the 149th German Infantry. You know the regiment, I think. In the regiment also was my brother—quite a boy, *mossieu*—little Carl Wassermann. Now, at that time the captain of our company was named Von Gunther; he hadn't changed his name to Grosskopf then, or taken up travelling in hardware as a business. Well, for some reason this brute took a dislike to Carl—God knows why; the little fellow had never made an enemy before—and made his life a misery to him. Nothing Carl could do was right, and he was never free from punishment. Do you remember the frontier manoeuvres of ten years ago, *Herr Hauptmann*—pardon me, I should say Herr Grosskopf? You remember perhaps how close we were to the French frontier. Carl came to me one night and said, "I am going to risk it, and try a run for France to-morrow. I have done my best, but I cannot please *him*"—you know whom he meant, *mossieu*?—"and they say in the French Legion they treat men like men, not dogs." I tried to dissuade him; but when we were on the march next morning, and within a couple of hundred yards of the frontier, Carl tried a dash. But our noble captain gave the order to fire on him; and when he saw that the men were shooting wide on purpose, he snatched a rifle and brought down Carl when he was within fifty yards of the frontier. Have you forgotten that? I have not! And now—now—Captain von Gunther, I have you! Five years' hard labour on the roads is the punishment for trying to induce legionaries to desert. It will be more for a German spy. Ah, would you?'

There was a crack, and a level line of flame shot from the spy's hand. Wassermann staggered, and then leaped forward, and the two men went down in a heap. Twice the long bayonet rose and fell, twice there was a thick gasp, and then a groan and silence, and Private Wassermann rose slowly to his feet in time to meet his comrades, whom the noise of the shot had brought running.

The sergeant in charge of the picket bent over the prostrate figure and then turned

to Wassermann. 'Tried to shoot you?' he queried.

Wassermann nodded. 'Yes,' he answered; 'and so I had to give him my bayonet. He has his affair, I think.'

The sergeant turned to his men. 'Take up *that* and bring it along,' he ordered. '*Hé bien*—one more of Wilhelm's spies out of the way, *n'est ce pas, camarade?*'

'Ten years too late!' said Private Wassermann, out of Alsace.

THE MONTH: SCIENCE AND ARTS.

A COMFORTABLE SHIRT.

UNDER severe or violent movements the ordinary shirt is likely to crease or ruck up, and the folds to become distinctly uncomfortable, if not irritating, especially to soldiers in the field, either of the cavalry or infantry. A special type of shirt, which prevents discomfort from such causes, has been produced, which follows the usual design, except that it is fitted with a short loose lappet attached to the bottom of the skirt, which is passed between the legs, then folded upward and secured in position by buttons attached to the front below the waist-line. In this way the shirt is kept firmly in position. It is useful to motor-cyclists, as all risk of chafing is prevented.

SALT-CUBES FOR COOKING.

Manufacturers are often accused of lack of initiative and want of ingenuity in studying the requirements of the market. Certain manufacturers have recently adopted a novel idea in the supply of salt. Instead of the salt being in large blocks, it is marketed in small cubes, each representing a measured quantity which coincides with culinary necessities; and as the cook takes one or more of these cubes for her purpose, she may rest assured that she is adding the exact quantity of salt which the dish requires. The cubes are packed in small cartons for convenience, and are sold at approximately the same price as the large blocks. Utility is not the only advantage of this arrangement. The salt is absolutely fresh, clean, and pure, and cannot be soiled, as no handling is required, for it is transferred direct from the package to the cooking-vessel. Neither is there any waste. So the salt-cubes are certain to have the approval of the frugal housewife.

A NOVELTY IN DOLLS' HOUSES.

The possession of a dolls' house is the height of every little girl's ambition and a constant source of juvenile delight. A decided improvement on this conventional toy has now been produced, and is named the 'screen house' from

the fact that it is built up in sections. Each section or screen is perfectly flat, and is equipped with window, door, and other fittings, together with the necessary appointments. The sections are so made that they will stand upright on any flat surface, such as the floor or a table. The most popular form at the moment is that representing a hospital, the equipment of which is very realistic. There is the usual hospital bed, upon which a wounded doll warrior is reclining, tended by a pretty doll nurse garbed in the correct hospital uniform, and with the Red Cross prominently displayed. The embellishments of the apartment comprise a table on which the invalid's meal is set out, and a chair and cushion for comfort when he reaches the convalescent stage, together with an assortment of such necessities as bandages, medicine-bottles, ewer, &c. The screen-house idea is a decided novelty and capable of illimitable variation; and, further, it possesses the advantage that when not in use it does not constitute an encumbrance, like the old style doll-house, as the parts may be dismantled and packed, together with the dolls and the furniture, in a small box.

AN AUTOMATIC VEGETABLE AND FRUIT PEELING MACHINE.

Probably one of the most distasteful operations in the kitchen is the peeling of root vegetables and fruits; but now there is a machine which does the work automatically. This machine comprises an outer cylindrical vessel, having near the bottom an annular ring which is free to rotate. This ring has a series of closely spaced blades set radially, and above it is placed a flat, perforated disc. The outer vessel is fitted with a union just above the bladed ring, and connected by rubber tubing to the ordinary tap. To set the machine in operation the peeler is placed in the sink and the rubber connection made. The cylinder is half-filled with water, and the potatoes or other articles, such as apples, onions, carrots, &c., to the extent of three or four pounds at one time, are placed within it. The tap is then turned on, and the water sets the annular ring of blades in rotation, the speed

varying according to the flow of water, so that the operation may be accelerated or retarded merely by adjusting the water-supply. Directly the wheel revolves the peeling process commences, and is completed in three or four minutes, when the water should be turned off to prevent undue waste of the articles under treatment. The peeling is carried out cleanly and with the minimum of loss of edible portions, and the cook is free to perform other duties while the work is progressing. The machine can also be utilised for washing and cleansing salads and other greens. For this operation it is merely necessary to withdraw and reverse the revolving cutting disc, so that the blades do not come into contact with the vegetables; but as they are in a stream of constantly running water, the agitation is sufficient to remove all grubs, insects, and deleterious matter.

RADIO CLOCKS AND WATCHES.

Some two or three years ago the German watch manufacturers placed upon the British market watches the hands and dials of which were made luminous with a light-emitting material, which enabled the time to be read with ease in the dark. The idea was novel, and exceedingly attractive and useful, but it was crude. One well-known British firm, which had been experimenting in the same direction, subsequently introduced a superior article, in which the numerals on the dial were luminous, so that its utility was very considerably enhanced. Recently the innovation has undergone considerable development, being applied to clocks of all sizes. The luminous effect is produced not by treating the numerals and hands with a paint emitting a phosphorescent light which has to be stimulated into activity by exposure to light, but by a substance composed of a combination of minute particles with a chemical compound, thereby providing a stable and permanent illuminating material which cannot deteriorate and which demands no previous exposure to light. The substance is prepared in such a manner that with ordinary care it will not lose its luminous qualities in the slightest. Such a watch is invaluable to soldiers when movements have to be carried out under cover of night, and when it is difficult to ascertain the time. More particularly is it useful in the trenches, where the slightest glimmer of light, even the striking of a match, may lead to serious disaster.

AN ELECTRIC-LIGHT SHADE-HOLDER.

Those who use electric light are fully aware of the difficulty of attaching an electric-lamp shade. The shade has to be held in position while the milled nut is screwed on; and this operation—the space being somewhat cramped—is extremely troublesome owing to inability to grip the nut firmly with the fingers. A shade-holder has been introduced which consists of two collars,

with a coil spring between. The lower collar carries the ordinarily shaped slots for receiving the lamp, both collars being really split rings. The bottom collar springs over and clips the standard lamp socket, while the coil spring lifts the top collar, which slides over the screwed portion of the fitting, and thus holds the shade firmly in position. The advantage of the holder is that the shade may be set in a moment; and as the two rings are split they may be sprung over all standard fittings, notwithstanding the fact that the fittings may not be quite true to size, when in ordinary circumstances the attachment of the milled nut is rendered more difficult. With this holder the shade is held just as firmly in position as if it were screwed up by means of the ordinary milled screw ring.

PROTECTING ST PAUL'S CATHEDRAL AGAINST FIRE.

Although the protection of St Paul's Cathedral against fire was completed some time ago, it was found that the method adopted possessed certain drawbacks. Hydrants were fitted at the main roof-levels, and were dependent for their water-supply upon rainwater-tanks placed on the stone gallery. It was found, however, that when these tanks were fully charged the great weights they represented involved a serious danger to the fabric, so that the fire-protection scheme underwent drastic revision. The system now installed completely meets the case, and should prove equally serviceable in connection with other buildings. A powerful electrically driven pump has been set up at the sixty-feet level, the power being transmitted from the motor to the pump through silent gearing. This pump draws water from the public main supply, and delivers it into the ring main round the drum of the dome beneath the colonnade, hydrants being fitted to this main at various points. Each of the hydrants is equipped with hose and other fittings. The outstanding feature of the arrangement is that the pump starts to work automatically when one of the hydrants is opened, so that a fire breaking out upon the roof-level can be attacked at once without the necessity of approaching the pump in the first instance. The moment the hydrant is closed the electric current is automatically cut off and the pump ceases. The arrangement is considered to be eminently successful, the tests of the system having proved satisfactory in every respect.

A KNIFE-CLEANING MACHINE.

A knife-cleaning machine has recently been introduced which possesses many interesting features. It comprises a wooden box containing double cleaning-pads which, instead of rotating, have an oscillating motion, the pads moving on ball bearings. The knife is slipped between the pads, and the latter are caused to move to and fro across the surface of the blade by slightly pressing the handle. The efficiency of the

pads is increased by giving them a corrugated surface, with the result that they give a straight burnish across the blade from edge to back, the motion being closely analogous to that of stropping a razor. The outstanding feature, however, is that the knives do not suffer any damage while being cleaned. By means of this knife-cleaner twelve table-knives may be cleaned in two minutes; it will take a carving-knife of any size or shape with equal facility, as well as dessert-knives; and not only does it clean the blades, but it imparts a keen edge to them. The cleaning-pads are durable, but when renewal becomes necessary they may be replaced at a nominal cost.

THE RIDDLE OF 'SPACE.'

The great Nobel prize which is bestowed on the most distinguished contributors to scientific discovery has been awarded to Professor Onnes, of the ancient University of Leyden, Holland, for his unremitting labours in investigating the question of the lowest possible temperatures. He has succeeded by unexampled ingenuity, linked to great industry and original thought, in producing what has been hitherto considered to be unattainable and a mere hypothesis—that is, the *absolute zero* of temperature. This, represented in figures, is two hundred and seventy-three degrees below Fahrenheit's zero, and may be accepted as affording us the probable temperature of, and conditions that prevail in, that mysterious and unreachable ocean called space. This discovery ranks in importance with any of the great discoveries of the past century, and revolutionises a great many of our accepted laws with relation to electricity and the kindred manifestations of light, heat, and motion. The discovery is a sequence of the researches and experiments that have been made with the metal radium and its 'emanations,' notably with helium, which Sir W. Ramsay found as a gaseous product of the transmutation of radium, and which was found to have a *lower* boiling-point than hydrogen. On this last point is based Professor Onnes's wonderful discovery. As the low boiling-point of hydrogen enabled Sir T. Dewar to produce hitherto unknown temperatures, and to make his remarkable discoveries and experiments with liquid air, so the lower boiling-point of helium rendered the production of still lower temperatures possible, which Professor Onnes has utilised to reach the lowest of minimum temperatures yet obtained, and probably the lowest that ever will be reached. The wonderful results that have been obtained at this temperature are most extraordinary; *perpetual motion* of an electrical current in a helix of metal is exhibited, non-conductors become active conductors, and their capacity for conducting is increased almost indefinitely! The usual resistances of substances to the passage of an electrical current no longer exist, and, in a word, the fric-

tionless attributes of space are demonstrated. A hitherto inexplicable phenomenon, the reversal of cosmic motion as shown in the reversed revolution of the most distant planets and the most remote satellites, is explained by electrical experiments at this temperature of absolute zero; and many other scientific paradoxes are made clear. It is an inexhaustible theme, and is the advance-guard of many great discoveries, the alchemist's dream almost realised—perpetual motion, transmutation of metals; and now we are waiting for the elixir of life!

AN ENGINE DRIVEN BY SEWER-GAS.

Of late years public opinion has become much more sensitive regarding the disposal of town sewage, while the laws relating to the pollution of rivers and streams, which have been made more stringent, are now rigidly enforced, the result being that every inland town is saddled with a heavy annual charge for purification-works. Under such conditions it is only natural that all possible efforts should be made to lessen the expense either by improved processes or by extracting by-products which can be sold for manure and other purposes. The latest purification system is simple and effective—hence no great economy can be expected from future improvements in this direction; and as regards the manufacture of manure, only a small number of towns have been able to produce saleable products, the disposal of sewage being a dead loss to the majority of municipalities. Any invention or discovery, therefore, whereby this loss can be minimised should be welcome, and one of the most promising ideas is to use the gas given off by the sewage for driving gas-engines. Almost every purification scheme includes what are known as septic tanks, where the sewage is allowed to settle for many hours, the liquid being drawn off at the top, while the solids which sink are extracted from the bottom. During this settling process gas is generated, which rises to the surface in bubbles, and it has been found practicable to use this gas in a gas-engine, although it is not suitable for lighting purposes. The gases given off from septic tanks are very offensive, and any treatment for rendering them harmless would be welcomed for its own sake; hence an invention which actually makes money out of the process at the same time has a doubly beneficial effect. Septic tanks at present are usually open, and they account to a large extent for the noxious smells emanating from sewage-works. Where this invention is applied the tanks will be airtight, with no outlet for the gases except through the engine. The first town to give a practical trial to this new method is Parramatta, in Australia, where an engine of sixteen horse-power is worked entirely by gas from the septic tanks. This engine drives a pump which raises the sewage some thirty-five feet, a work previously performed by steam-

engines, for which coal had to be bought. Furthermore, the supply of gas is so regular and certain that the engine can be left running all night without attention, thus effecting a saving in wages and fuel which will pay for the new engine in about five months. According to the inventor, Mr Walshaw, this system should yield about one hundred and fifty horse-power in a town of ten thousand inhabitants, or enough, if used for producing electricity, to supply light for the whole town. Again, many large country houses have their own sewage-disposal works, and the gas generated therefrom should give sufficient power for lighting the house, while removing a source of offensive smells.

BANKING IN THE UNITED STATES, AND THE FEDERAL RESERVE BANKS.

Financial panics are of more frequent occurrence in the United States than in Britain; and it is generally admitted that they are caused by what is termed in America 'the inelasticity of the currency.' Now, as this expression may not be familiar to many persons in Britain, a little space is devoted to the explanation of these words. In London, when a banker requires money he takes commercial paper to the Bank of England—that is, promissory notes, drafts, &c. which he has discounted. The Bank of England rediscounts this commercial paper, and the banker obtains money with which he is enabled to continue making loans to his customers, who are then in a position to continue undertakings which, without financial assistance, might be brought to an untimely end. If the directors of the Bank of England find that too much money is being withdrawn from the bank they raise their rate of discount, and money flows back again into its vaults.

In the United States there is no powerful central bank whose business it is to discount commercial paper held by bankers; and the result is that when a bank has lent to its customers as much money as it deems prudent for safety, it is compelled to refuse further financial assistance, and those who had relied on assistance from their bankers in carrying on legitimate enterprises are unable to meet their obligations. Now the money lent by the bank belongs mostly to the depositors. These, hearing that the bank refuses to make advances, and that some of its customers are in difficulty, commence withdrawal of their deposits. The bank, being unable to obtain help from other bankers, suspends payment, a state of uneasiness prevails, and a financial panic ensues.

The banking law which the United States Congress has lately passed, but which is not yet in force, will put an end to this unfortunate state of affairs. Under the provisions of this new law, the Government will establish in certain cities, which have not yet been selected, a bank whose special business will be to discount commercial paper

tendered by other banks. No business will be transacted except with banks, and only with those who have joined the so-called federal reserve banks; and in order to join these, a bank must contribute a certain definite proportion of its capital. This contribution forms the capital of reserve banks; but, in order to provide ample funds for the business of rediscounting, the United States Government—and this is the most important part of the measure—permits the reserve banks to issue notes (bills they are called in America) to a practically unlimited extent. These notes are guaranteed by the Government, and are therefore for all purposes, except exportation, as good as gold. Of the profits made by the reserve banks, not more than 6 per cent. interest on the amount of their investment is to be paid to the affiliated banks, the surplus being devoted to some other purpose. There is every reason to believe that this new banking law will be very successful.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

NEVER OR NOW.

AN APPEAL.

(Written in 1862, soon after the outbreak of the American Civil War.)

LISTEN, young heroes! your country is calling!

Time strikes the hour for the brave and the true!
Now, while the foremost are fighting and falling,
Fill up the ranks that have opened for you!

You whom the fathers made free and defended,
Stain not the scroll that emblazons their fame!
You whose fair heritage spotless descended,
Leave not your children a birthright of shame!

Stay not for questions while Freedom stands gasping!
Wait not till Honour lies wrapped in his pall!
Brief the lips' meeting be, swift the hands' clasping,
'Off for the wars!' is enough for them all!

From the hot plains where they perish outnumbered,
Furrowed and ridged by the battlefield's plough,
Comes the loud summons; too long you have
slumbered,
Hear the last Angel-trump—Never or Now!

OLIVER WENDELL HOLMES.

. TO CONTRIBUTORS.

1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them in FULL.

4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Chambers's Journal

SEVENTH SERIES

THE DOOM OF THE ZEPPELIN.

By R. W. BURGESS.

CHAPTER I.

FROM end to end Germany was seething. Hymns of hate and victory rang through the city streets, and to every village and isolated farmhouse the glorious tidings had been carried. London—proud, cynical London—had been bombarded by a fleet of a dozen Zeppelins, and, according to official accounts, left a mass of flaming wreckage! Wild rumours flourished and grew apace. King George, the Lord Mayor, and the heads of the Admiralty and War Office, it was reported, had all been killed by one master-stroke, an incendiary bomb dropped on Downing Street during a midnight Cabinet meeting. Those of the panic-stricken citizens who had been unable to flee in time from the doomed city were said to be huddled, in darkness and suffocation, within the sewers and in the tunnels of the tube railways, where they would inevitably be starved or smothered, the outlets being choked by the ruins.

True, only five airships had returned to their base; but what of that? Had not the Fatherland a new fleet of a hundred or so on the point of completion, ready to carry on the sacred crusade of death, culture, and destruction should the vile traitors to civilisation across the sea delay in suing for peace upon any terms?

Glorious news indeed! Forgotten were the black days; the refugees that were pouring into Berlin, forced out of the border towns and villages by the iron ring that was gradually contracting and throttling the life of the country, arrived cheering and singing, instead of weeping, in a city gay with flags and music; the pall of mourning and gloom that had hung for so long over the capital had vanished as though it had never been, and to the eye all was as in the early days of the war.

It may have occurred to some of the more thoughtful to wonder how all this precise and detailed information had been gathered by the Zeppelins while floating in the air at midnight three thousand feet above a darkened city; but at the moment no such doubts found expression, and it was a day of delirious rejoicing.

London, in truth, had suffered badly enough. Although, from the military point of view, very little had been accomplished, and more than

half the invading air fleet destroyed, there was consternation among City men in the morning, when stock came to be taken of the damage done. Incendiary bombs had been showered down on the stores and warehouses in the narrow streets of the City, and huge blocks of buildings were still blazing furiously, despite the valiant efforts of the fire brigade.

The gaunt, riven skeleton of a fallen Zeppelin lay across a scattered pile of ruins in Wood Street; her cargo of bombs had exploded on falling, and she rested on a ghastly funeral pyre of twisted girders, shattered masonry, smoking débris of burning woodwork, and a holocaust of the stock of a large fancy goods warehouse. Another, whose cargo had exploded and spent its force in mid-air, pouring down a blazing rain of petrol upon the streets as she fell, lay broken-backed across the railway viaduct at the bottom of Ludgate Hill, her blackened ribs, with ragged fragments of her silk envelope attached, completely blocking the roadway to St Paul's, trailing a confused mass of wrecked machinery across Ludgate Circus to Fleet Street. There was a big blaze down by the docks. The Government offices, the Bank of England, the Houses of Parliament, and the bridges across the river had all received attention; but the damage in these quarters was not serious, owing to the difficulty of definite aim.

The immediate result was that all recruiting offices were besieged. At last war was brought home to us, and the young men realised that to remain in their shops and offices might result in these same buildings being blown about their ears. By evening London was a city of middle-aged men, stern-faced and silent, resolved grimly to carry on, whatever might befall before the return of their sons.

'Great news, Jack! We've got real live men at the Admiralty these days, instead of sleepy, nodding mandarins. That demonstration of yours with the gas-bags finished it, and you're to be gazetted Naval Engineer Lieutenant, with a free hand to rig up any fandangles and whig-maleeries you like on Submarine X 1. How 'll that suit you?'

Jack Elwin, a young electrical engineer, swept aside the papers and diagrams that lay spread out on his desk, and jumped up to greet his friend, Lieutenant Charles Cartwright, late of H.M.S. *Swordfish*, recently mined in the North Sea.

'If you're pulling my leg, Charlie, I'll *Kultur* you until even a gentle Uhlan would have no use for you. Is it straight?'

'Straight talk, Jack. My father has just got home from a pow-wow with the bigwigs at Whitehall, and is keen as mustard about it. I bolted round at once to tell you. Rejoice, my son, and salute your commander.' Charlie tapped himself on the chest.

'Given you the ship, have they? Good men! Where is she now?'

'Porthampton dockyard. Her engines are being fitted, and she was to be ready for sea next week; but they have just wired to stop work on her until you can go down and arrange for your bag of tricks. Now run along and get into war-paint; got orders to bring you back to dinner. Hurry up with your adornment, and remember the taxi is ticking up twopences all this time.'

Charlie Cartwright, prowling round the untidy apartment that served Elwin for living-room and study, shouting crisp commands calculated to speed up the beautifying process of his friend in the adjoining bedroom—from which came sounds of much splashing, opening and shutting of drawers, and smothered profanity—halted before a side-table on which stood a working model of the new engine of warfare.

The dynamo that supplied the power was at rest; and when Elwin emerged from his room clad in the sober glory of dinner dress, Charlie was idly turning switches, and swinging to and fro the curious little telescope with a saucer top that surmounted the instrument.

'Can't make head or tail of this contraption of yours, Jack,' said he, puzzled and frowning. 'A gun with a spy-glass for a barrel that doesn't fire anything don't seem natural, somehow. If you were not you, I should say the whole thing was a fake.'

'Just what the War Office seemed to think, Charlie. It was only the Zeppelin raid and your father's influence at the Admiralty that got me a show at last. You see, this is the principle of the thing.'—

'Oh, for heaven's sake don't begin explanations now, or we shall starve! The dad is sure to want to know all about it after dinner, and I will metaphorically sit at your feet and gaze up into your inspired face with adoring eyes, while you'—

A sofa-cushion, aimed with force and precision, smothered the rest of the speech.

Admiral Sir James Cartwright, a well-set-up veteran, with clear, keen eyes that seemed to have caught the colour of the sea in storm,

shaggy brows, and a mass of grizzled hair waved and crisped by spindrift and gale, was waiting for the two young men when they arrived at Grosvenor Square.

Between father and son there was a striking resemblance. The clean-cut features were the same, save for the deeper graving of the lines on the face of the elder man. The fire of youth that in the younger was a leaping, joyous flame, urging him on to any dangerous and desperate adventure, had given place in the elder to a deeper, steadier glow of grim determination, and the wide mental grasp of a situation that years alone can give. The sea had set its seal upon both, each according to his length of service.

'Congratulate you, Jack, my boy,' said Sir James, as they gripped hands. 'You will hear from the Admiralty in the morning. No red tape these days. Ready to join your ship to-morrow?'

'Sooner the better, sir. At Porthampton, Charlie tells me.'

'Yes. You will have to call at Whitehall at ten o'clock to sign papers. Get your traps ready, and I will come round for you with the car, and take you down to the dockyard by road. The railway's full of troop trains just now.'

'Thanks. I'll be ready. Any fresh news?'

'Nothing for the public, but you're on another footing now. Our air scouts tell us there are big preparations in Heligoland for the assembly of an air fleet, and we know that at all Zeppelin bases they have been working night and day for months. It is probable that they have about fifty new dirigibles building, and that the raid on London last week was a sort of trial-trip.'

'Any idea how much time we have, sir?'

'Possibly a month, from what our Intelligence Department tells us. That's enough now. While we are talking the soup is cooling. Sailors must feed though the heavens fall.'

During the meal Elwin heard current events discussed from an entirely new angle. It was most illuminating. Events that, so far as the public had been allowed to know of them, were insignificant, he now realised for the first time were movements of vital importance, while the brilliant *coups* that filled newspaper headlines were often but minor incidents in a carefully considered plan of campaign.

It was not until coffee was on the table, and the three men were in that receptive and tolerant frame of mind born of a good dinner and perfect digestion, which enables us to endure with resignation even the infliction of prosy speeches, that the new arm of the navy was again referred to.

'Now, Jack,' said the Admiral, 'I want you to give me some notion of what this new machine

of yours really is, and how it works. What it does we saw the other day.'

'Delighted to explain. Hope I sha'n't bore you. It is really simple enough.'

'No doubt, to people like Ryestone, the Government expert. All the rest of us were out of soundings while you were expounding to him. Saw his report to-day. Says, among other things, that though he is unable to give an analysis of elwinite, the curiously inert substance of which the insulator is composed, he sees no reason to doubt the correctness of the formula. Also, "the model is constructed in accordance with the plans supplied;" and after independent personal tests he is of opinion that "the claims of the inventor are justified."'

'Worst of you scientific Johnnies,' broke in Charlie, 'is you always think you are lecturing to pro's. Now hold forth, most learned sage, and don't forget the infant class.'

'I'll try to get down to your level, Charlie,' returned Elwin, laughing.—'You remember how keen my father was about wireless, Sir James, and that he fitted up that installation in the Orkneys which the Government took over when he died?'

'Had many a message from him when I was cruising in the North Sea,' Sir James replied.

'Well,' returned Elwin, 'he seems to have been experimenting with the possibility of concentrating and directing the ether waves during his later years, but without success. I found all the notes among his papers.—Know what ether is, Charlie?'

'Stuff they put on your gums when you have toothache, isn't it?'

'Abysmal ignorance! How is one to sound its depths? No; that is a misnamed anæsthetic. The ether with which we are dealing is but a hypothetical intangibility; the substance of emptiness, so to speak; the imponderable spirit of matter that envelops and permeates the universe; the vibrant medium that transmits from sun and stars those forms of energy which we'—

'Oh scissors! so young and beautiful, too!' murmured Charlie. 'Come down to earth, old man; cut it short, and let's have it in English.'

'Sorry,' laughed Elwin. 'I will try to pander to your earth-bound intellect. Know what a molecule is, Charlie?'

'Yes; the young of the mole.'

Jack groaned. 'I see I must reconstruct the universe for you before you will understand, and there isn't room for it in your head, empty though it is.'

'I think we shall get along quicker if you cut out the long words, Jack; and if you, Charlie, stop pulling his leg,' Sir James interposed.

'Sailing orders, Jack. Henceforth I am

dumb as a sleeping oyster tucked up in his bed.'

'I will be as brief as I can,' Elwin continued. 'As you, Sir James, are no doubt aware, but as Charlie certainly is not'—looking sternly at his friend, who pathetically placed one finger on his sealed lips—"ether" is a term used by scientists to indicate a carrying medium for certain forms of energy, the transmission of which can be accounted for at present only by assuming theoretically its existence throughout the visible universe, rarefied to an inconceivable degree, filling all space, and permeating all matter; the medium in which the atoms and molecules that go to build up all gaseous, liquid, and solid substances vibrate in response to the laws of attraction and repulsion that govern their structure. It is through this continuous conductor, and not through the material of air and earth itself, that the waves of energy pass from the wires, and it is just the universal continuity of the medium that has prevented any control of direction.'

'I follow you quite clearly, so far,' said Sir James. 'The ether waves spread in much the same way as ripples on a pond when a stone is thrown into the water.'

'Exactly; and their passage through solid bodies may be compared to the passage of the water-ripples through the sedges and reeds near the bank. Now, it is obvious that if any substance could be produced so dense and homogeneous that it would neither absorb nor transmit these undulations, they must be thrown back. It was this reflector that my father was seeking before he died. It seemed a hopeless quest, as it really assumed the existence of a new form of matter, absolutely amorphous and structureless, of inconceivable density. It was, of course, known that wireless messages pass more freely through air than through earth, but this seemed due entirely to absorption, a dispersal of energy through the mass.

'Continuing my father's researches, I found that, in some localities, by placing my receiver between the sending station and certain hills, I fancied I could detect a very faint reinforcement of power. By following this up, and experimenting with minerals and rocks quarried from these hills, I at last obtained a distinct, though very slight, reaction; and eventually, by extracting certain elements and fusing them together in electric furnaces, I obtained the substance that resisted Professor Ryestone's analysis—the reflector of my apparatus. In respect to my primary object, the transmission of messages, there are certain difficulties due to interference still to overcome; but there was one quite unexpected effect produced, upon which depends the success of our new weapon.'

'Now we "come to the osses,"' cried Charlie, as he straightened up in his chair.

'The ordinary diffused wireless discharge,'

Elwin resumed, 'produces no perceptible disturbance in its passage; but the intensely concentrated discharge has very peculiar effects, depending upon the molecular cohesion of the substance through which it passes.—Cheer up, Charlie, you'll soon be dead,' in response to a dismal groan from that young man.—'To resume: the general effect is to increase molecular activity, a tendency to drive the particles, which even in the densest solids are always in motion, farther apart from each other in their oscillations. Passing through solid bodies—solid because the power of mutual attraction between the closely packed molecules is strong enough to retain them in place in spite of these vibrations—the effect is slight, producing a greater or lesser rise in temperature according to density. With liquids, a sort of neutral state of matter in which attractive and repulsive forces are evenly balanced, the effect is more marked, causing ebullition.

'The maximum effect is produced with gases. In the gaseous state of matter the molecules are normally far more widely separated, and their oscillations correspondingly more rapid and violent, so much so that their power of attraction for one another is overcome, and, unless contained, they will fly apart and disperse. The effect of the discharge from my apparatus is enormously to increase this activity, causing a corresponding increase in bulk or pressure on the container. The more nearly the state of matter approaches in tenuity to that of the intangible medium with which it is permeated, the greater is the effect produced by a disturbance of that medium.'

Sir James had listened with growing attention. 'I see the whole thing now,' he said. 'When you focus on a balloon the gas expands and rips the cover, eh?'

'Pop goes the weasel,' remarked Charlie. 'What happened when you first stirred up the molecules, Jack?'

'Blew the windows out of my workshop,' replied Elwin, laughing.

'It looks like a big thing, my boy,' said Sir James. 'It was true patriotism on your part to place it unconditionally at the service of your country. How are your finances? I know your father was not a rich man.'

'Oh, he left enough for me to carry this thing through, and now there will be my pay from the navy. We've all got to give our best these times, and put our shoulders to the wheel.'

'Right!' said Charlie. 'We'll "roll the old chariot along," and come home with the bands playing, father. Thing to do now is to hustle the dockyard and get to sea before Butcher Bill can fill his sausage-skins.'

His father laughed. 'Charlie's ideas are sound, despite a certain lack of dignity and reverence in the manner of their expression. By the way, Ryestone is going down, so you will have his technical knowledge and authority behind you, and all the resources of the dockyard. You'll find you are a big man just now at Porthampton.'

'Flattering to my personal vanity, I am sure,' laughed Elwin; 'but I have no doubt of success if the X I will hold sufficient power. We must sacrifice torpedoes for accumulators and dynamos. I shall want all the space there is. And now I must get off home and pack ready for the fray, if you will excuse me.'

'Just a final toast,' sang out Charlie, raising his glass. 'To the bonny lights o' London, that will shine bright above the great Sir John Elwin; and may he never get swelled head.'

'And may Charlie prove a true prophet,' added Sir James, rising. 'I drink the toast with pleasure, while assuring our guest that I consider my son's final remark uncalled for. Don't trouble to respond, Jack. Good-night, and God save our king and country.'

(Continued on page 166.)

'PERSONAL'

By ROBERT MACHRAY.

NOT the least attractive feature of our daily Press is that which bears the title of this article, and is familiarly called, with a truthfulness that is largely mixed with sardonic humour, the 'agony column.' Ladies are credited with scanning the lists of births, marriages, and deaths before looking at anything else in the paper; but even they must sometimes glance first at that part of the page headed 'Personal,' and in any case, it may be conjectured, never fail to pay it marked attention, particularly when it starts, as very frequently happens, with something suggestive of romance, or at least alluringly sentimental. Indeed, one may deduce from the

character of many of the items that its appeals are mainly intended to touch the tender hearts of women. Touch, in its slang signification—as when Brown reports that Jones has 'touched' Robinson for a fiver—is a most excellent word in this connection, as not a few of these 'agonies' manifestly partake of this touching nature. Hence men will scarcely make a point, as does the softer sex, of studying the 'Personal,' nor are they likely to be so much impressed by it. Many of them must peruse it with very mingled feelings, pity and sympathy warring none too successfully with suspicion and incredulity, amusement and contempt. Unforgotten and un-

forgettable experiences of having been 'touched' warn them off the grass, appear it ever so inviting. Yet somebody must respond, or a number of the 'agonists' would require to retire, one may guess, from the business.

Of course there are agonists *and* agonists. Far be it from me to say that all or most of them are writers of fiction. For my own part, I prefer to take their productions at their face value, whatever my inward scepticism, and confess that I seldom miss any; though I cheerfully admit that my interest in them is well-nigh entirely professional. That any habit-and-repute teller of tales, like myself, should overlook or forgo this unflinching and abundant source of supply would be little short of sinful. For the agony column is simply replete with stories, plots, and mysteries, or hints of them, which the boding imagination need find no difficulty in shaping into complete narratives.

Many newspapers have the 'Personal;' but in this rich mine the finest vein is to be struck in the *Times*, which prints every day from thirty to fifty agonies of one kind or another. The humble novelist may rejoice that the leading journal of the world, with this copious and varied store of finished or raw material ready to his hand, is now, at a penny, within the compass of his modest means. *Per contra*, he may reflect with some misgiving that this prodigious store which the paper places at his disposal is also open to all and sundry, and makes it a formidable competitor in his own field; and not quite a fair competitor either, as, instead of having to pay for its stories, it gets paid for them under the specious pretext that they are only advertisements. Rumour, however, asserts that some, at any rate, are written by the *Times* itself; but it is no more than bare justice to say that what gentlemen of the higher criticism term internal evidence is fatal to such an idea.

As a matter of fact, a not inconsiderable proportion of the items which are capped 'personal' are advertisements pure and simple, and one might be disposed to wonder why they should be published in the agony column at all were it not for the strong presumption that it is just about the most widely read part of the paper. The *Times* does not disdain to use it to attract attention to its own goods; thus in it mistresses and servants are told that they should see such and such pages, the said pages containing other advertisements, headed 'Situations Vacant' or 'Required;' and this implies that these subscribers or readers take a keener interest in the 'Personal' than in those other columns. Undoubtedly it is a superlative medium, and if it is not the extra cost it can only be the infallible sense of the eternal fitness of things which is the peculiar possession of the *Times* that keeps it within comparatively narrow bounds. In this class are advertisements such as some journals put under 'General Notices'—notifications of meetings,

dinners, dances, sports, demonstrations, changes of name and address; thanks for votes, gifts, and donations to charities; positions desired; specific articles lost, for sale, or wanted; and a host of things besides. Now and again is to be perceived in two or three of these a trace, as a chemist would phrase it, which connects them with the veritable 'Personal.' For instance, there is the 'Lady of Rank' who is willing to chaperon a girl and give her every social advantage for the season. What agonies may not be implied here?

Then comes a large intermediate class, rising from the mere advertisement on the one side to the agony proper on the other. To it belong the missing—missing wills, missing marriage certificates, and most of all missing men and women, who are entreated to communicate with their relatives and friends, or, perchance more fortunate, are informed that they will 'hear of something to their advantage' if they will call on certain lawyers; and to the majority of these it is easy to attach a story, a romance, or perhaps a tragedy. Less poignant are the tales of woe that underlie rewards for dogs that have disappeared, yet a whole world of emotion may be concealed under the bald statement that a reward of ten pounds is offered for the brindled Aberdeen terrier which answers to the name of Neddy. In this category should perhaps be placed the conscience money received by the Chancellor of the Exchequer; but it is noteworthy that these acknowledgments do not seem to be so common as they used to be, and one might almost suppose that there is a caustic in the high finance of the present Chancellor which makes consciences less sensitive than of yore.

But the agony column received its distinctive name long ago, principally because it was the vehicle and the voice of lovers, who employed it for good reasons of their own. As a vehicle, it served for introducing one unknown to another, suggested meeting-places, supplied signals of recognition, exchanged messages, and afforded all manner of hints for the guidance of suitors; not to put too fine a point on it, it somewhat more than smacked of plots, stratagems, and intrigues. As a voice, it gave urgent and intense expression to their hopes and fears, their joys and sorrows, their ecstasies and their despairs. Now its tone was that of frantic impatience, perfervid entreaty, or eloquent expostulation; anon, of exultant delight; but more often than not of bitter lament and heart-broken farewell. The dark, not to say the black, side was apt to come uppermost. The course of true love never did run smooth; but the dolorous way of most of these poor souls was, if you were to believe them, hedged with thorns, strewn thick with sharp-edged stones, or barred by frowning and precipitous rocks. In a word, the lovers agonised; and sometimes the agony was prolonged through months and even years of excited and anguished

correspondence. And none may tell what deep abysses of sentimental suffering are to be discovered in the agonies which appeared, as many of them did, in strange and mysterious cipher. True, it has been alleged that these cryptic affairs were written by swell cracksmen and other criminals as a safe and secret means of imparting information to their pals; but one naturally prefers to think that romance shines through the veil.

The above paragraph is in the past tense, for the cogent reason that though the love-agony still holds pride of place, it no longer bulks large in the 'Personal,' and rather looks like disappearing altogether. Its passing will, in this dun world, be a most regrettable circumstance, for when it has vanished the column will never be the same again, and the gaiety of the nation will suffer sensible eclipse. Not that the love-agony was charged with wit or humour; whether *in exceleis* or *in extremis*, it was always very serious indeed. But all the world loves a lover, even the lover of the agony; and, though it laughs at him, it does not cease to love him, and would fain bid him not die. Perhaps it is the telephone, with its easy gambits, that is killing him off. Pity 'tis if go he must! Yet he has had an immense innings; he has played the game, in the *Times* at all events, for more than a century. Here is a specimen of his style which saw the light in 1802: 'Incognita's elegant and well-composed Epistle, of the 19th instant, has had all the impression that could be expected; another, with real name and place of abode, may be safely ventured. An immediate intercourse is earnestly requested by Leander.' His tone is most grave but most polite; it is of the period when the game, like cricket, was played in tall hats.

That tone is scarce maintained by present agonists. You see Leander was a decorous person; you judge him a model of deportment; you may say that, like the fair Incognita's letter, he is well composed. And he means business, although his formality appears much out of date in this bustling and eager time of ours. He is respectful, not aflame. But the fire of passion blazes up fiercely enough in other agonists of the past. As might be expected, the lover of the agony of to-day is excessively modern; thus 'M.' asks 'Lilian,' in a recent issue of the paper, 'Must I play hearts or diamonds for a grand slam?' In her reply the lady retorts in the same spirit of modernity, but with a spirit of her own, that 'the grand slam is only possible to the player who has a quality you lack—courage.' Airy, fairy Lilian! Yet he well deserved the deadly thrust, the ungallant fellow! Still, even in this mercenary age, an occasional agony recalls the old atmosphere, as when, last June, 'Alhambra Edwin' flings across the void to 'Mamie' the burning words, 'My soul cries out to yours!' or when, in the same month, 'Edith Gertrude M.' declares to 'Alfred E. B.'

that, having watched him very closely for many weeks, she has come to the conclusion that it is only her fortune that keeps him silent, and adds: 'May I tell you in all maiden modesty that if this is so, my fortune will have proved my worst enemy!' Bravo, Edith Gertrude M.! I doff my chapeau to you, and hope you will be happy.

This mercenary age! The phrase is quite germane to the most common and characteristic 'Personal' of our own subfusc period. For, alas! the passionate note has pretty generally been replaced by the pecuniary. The typical agonist of our time has but one great desire—not love, but cash. He may call it 'work,' but it's your money he wants. In plain terms, he is a cadger. For himself, he disdains plain terms. He has style, and plenty of it, and a wealth of imagination and a copiousness of vocabulary which are distinctly enviable. He is a firm believer in putting the best foot foremost. His modesty does not shrink from cataloguing his virtues and accomplishments; on the contrary, he assures you in the loudest of voices that he is possessed of knowledge, skill, cleverness, adaptability, resource, anything you please. You stand amazed that he has not succeeded long ago in bursting open every door of fortune. Yet somehow he hasn't; incredible, but true! Some inexplicable freak of fate, some strange perversity of circumstance! Ah, if only he had money! Why should he be compelled to go without it? What matter if he does not seem to have been able to work for it when he tells you so positively how well he will work after he gets it? Won't you place it in his capable hands? You will never regret it. And so on, world without end. He is a very king of cadgers.

A fine sample of this kind of agony, made more moving by its demand on sentiment, appeared in the *Times* a little while back from 'Breezy Bill.' It began, 'A Wanderer's Return,' and continued: 'Refined Englishman, twenty-eight, who has supersatiated a cursed wanderlust by adventure, toil, and peril in many lands, seeks position at salary sufficient to enable him to marry the dear little English girl who has been unwaveringly true. Our wants are small. Our happiness will be infinite. Eight years Continent, South America, Far East, South Africa, &c. Experience—accounts, correspondence, tresorial, literary, salesmanship, publicity, three languages; genuine battler; never gets tired; gourmand for work; demon for organisation; seeks no sinecure, but will do anything honourable, and do it well, for one hundred and fifty pounds p. a.'

Not quite a week after the publication of Breezy Bill's astonishing appeal on behalf of himself and the dear little English girl, a 'Capable Young Gentleman with Yorkshire grit,' who at the close of his advertisement said he was a 'peasant's ambitious son,' and had 'climbed

from a lowly lot by scholarships, perseverance, and determination,' made it known through the agony column of the same journal that he sought a post with prospects. He stated that he was a 'varsity and public school man, who had taken honours, and that his qualifications combined 'clean character, unstained honour, exceptional references, tactful and adaptable (*sic*), marvellous ability.' He thoughtfully added, as well he might in view of his marvellous ability, that he was willing to 'try anything: no shirking.' About the same date 'Young Author' entreats some one having influence with publishers to get one of his compositions read by a discerning and competent critic. He himself, he confides to us, has endeavoured to achieve this feat, but has failed, 'despite possession of exceptional gifts, which include the wit of a Mark Twain, the philosophy of a Carlyle, the intricacy of plot of a Conan Doyle, the descriptive power of a Dickens, and the brilliance of dialogue of a Dumas.' There's richness for you! as Mr Squeers might exclaim. Another advertiser, in great distress through misfortunes brought on by others, implores occupation for mind and body; but thinks that instead of prejudicing his case he will ensure interest and sympathy by announcing first that he is 'of distinguished appearance and ancient ancestry.'

Most of such agonists take their stand on sheer merit, albeit it is merit which a purblind world has not hitherto recognised, and at least it is to their credit that it is work they want. A far larger number want hard cash. Some of these are mendicants, naked and unashamed you might say, and besides themselves Heaven alone knows how true their stories are; but their harrowing appeals to the charitable condense with extraordinary skill the whole art of the begging-letter into a piteous paragraph of two or three lines. Occasionally the bait is held out that the 'advance will be refunded;' one suppliant naively puts it, 'repayment intended.' Others, again, are not mendicants at all; they would be seriously displeased if they were herded with these poor folk. They want money,

but as a loan, as a business proposition, and not infrequently on what they consider splendid security. They have exciting schemes and projects to unfold, wonderful inventions which need but to be financed, flourishing enterprises that require just a little more capital, magnificent gold-mines which only ask—gold for their development. At the worst, they have always something to offer; nor are they all persistently opposed to encouraging philanthropy—that is, on terms. A recent advertiser informed lovers of mankind that he had an opening for twenty thousand pounds 'for a good purpose, in small or large sums. Interest 6 to 8 per cent.' Another asks quite blandly for '£500.—Will some wealthy and generous person purchase annuity of ten shillings weekly, a godsend, for respectable but struggling young couple with baby?'

On reading agonies of all sorts, some of which, one might think, would hardly impress a child, the inevitable question arises whether or not they attain their object. Some obviously do, and from the continued popularity of the column the answer in many other cases would appear to be yes. The sentimental agonist now and again certainly gets a reply, though it may not be such as he seeks, as we have seen in the sharp encounter, related above, between 'M.' and 'Lilian.' And we may suppose that the financial agonist finds that on balance the thing pays, or, like Shelley's mariner, 'worn and wan, never thus would voyage on.' A writer in the *Times*, who lately discussed this feature of his paper, came to the conclusion that possibly the numbers wanting money 'get more than they deserve.' His phrasing is perhaps not just the most tactful in the world—from the standpoint of these patrons of the column, or even of his own advertisement manager; but in a way he is not discouraging. It is to be noticed that many agonists describe themselves as elderly, and it is impossible not to suspect that they regard the 'Personal' as holding out the hope of something much better than an old-age pension.

THE BRIGHT EYES OF DANGER.

By JOHN FOSTER, Author of *On Old Speyside*, *The Bernardine*, *The Ship of Shadows*, &c.

CHAPTER XI.—THE SECRET WRITING.

MY request for a fire was natural and easily understood, for I had been all night in the chilly room, and the morning air was sharp; but to ask for pen and ink might have aroused curiosity, so I cast about for a plausible excuse for the use of them. Now, by some strange chance—for I never was over fond of books, much less of Latin—I had in my pocket a copy of the first three books of the *Æneid*, the curious,

perhaps ironical, gift of an old Westmorland tutor, for he had shaken his patient old head many a time over my indifference to the classics. The little Virgil, in its brown and shabby binding, lies within reach of me as I write, a cherished possession, for inside it came to be written a few words that meant much to me, and there is an ugly knife-mark in one corner. How these came there I shall tell in due time.

I took out the book, laid it on the table, and waited patiently for the return of the servant.

A quarter of an hour passed before he came back and unlocked the door, to discover to me the lady of The Garth. I rose and bowed, receiving in return not the ghost of an inclination of her little dark head. Now I am an oaf at picturing women's dresses. I never can name them, much less set them down aright on paper, so I will not attempt it. But as she stood there in the morning light, looking at me with the gravest little air imaginable, the door framed the fairest picture that I had seen. She wore a morning gown of a gray and delicate texture, her snowy throat bare, a dark girdle clasping her slim waist, a single white rose in it. From her little hood or screen of tartan, shot with red and green, to the silver shoe-buckles sparkling in the light, she looked the incarnation of radiant maidenhood. She took off the hood, and a glorious coronal of blue-black hair caught the morning sun. It was dressed in a coil in a fashion I had never seen, very taking to the eye, the light playing through it. Her face was as pale as when first I had seen it, but of a rare purity of complexion (I could see the warm colour ebb and flow on her neck and cheek); its contour the most perfect oval, her brow like Clytie's, her eyebrows with the delicate arch that bespeaks spirit and imagination. I set all these attributes down here now; but at the moment I think I did nothing but gaze in admiration at the hazel stars of her eyes, a gaze that must have bordered on the ungallant, for the maiden looked past me, and a patch of colour shone for a swift instant on her pale face.

'It seems—my servant tells me—that you find your apartment somewhat lacking in comfort,' she said. Her voice was of silken politeness. In it was the faintest and prettiest Highland accent, scarcely noticeable even to me, a Southern, yet with an undertone of hauteur that was greatly disconcerting. But her eyes held all compensation, clear deep pools, steady and courageous, yet that could be wondrous soft and beseeching at times.

'Prisoners, like beggars, cannot be choosers,' I made answer, with an attempt at a smile.

'Which was just what I was going to remind you of. You sent a message demanding fire and pen and ink, as though you were an honoured guest, instead of—instead of'— She stopped abruptly, looking for a contemptuous word to match the curl on her lip.

'Instead of'—

'Instead of a trapped fox.'

'You are a woman, and names from a woman do not hurt a man,' I said; but I am afraid that the ring of my voice belied the words. 'Twere different were you a man. Then we could settle this matter, whatever it is, in a man's fashion,

ten paces between us on the grass, or steel against steel.'

'This is news indeed to me that any of your gang ever fight like honest men.'

'We bandy idle words, madam. May I ask how long I am to be detained here?'

'Seeing that you ask for a fire and what not, it would seem that you already are resigned to a spell of indoors. Ah, Mr *Layton*! is it not in your heart (your heart indeed—what am I saying?)—in your mind, then—that you know full well I should be but a sorry daughter of my clan if ever you saw the sky again, unless face to face with your judges?'

'Then, in Heaven's name, are there no judges in Edinburgh? Send me under escort to them; and, if my offence warrants it, no doubt I shall swing in a tow.'

(I had little fear of that, thought I, if once I got back amongst rational people.)

'And this would be a fine thing indeed to have Whig judges hear the story! I am thinking there would be better men than you clapped in the Tolbooth. You pay a poor compliment to my wits. Send you to the judges in Edinburgh! I can imagine the sorry business, the lies, the'— She broke off, as if a thought had suddenly struck her, and then continued, her voice hurried and shaking: 'Do not tell me that Philip Macdonell—surely—surely he never would—his name is mine and his shame would be mine and his clan's. Glenira is of his blood. Philip would never stoop to touch the Elector's gold. The business he is out on is deep and black enough without that.'

'I know no Philip Macdonell—I know no Glenira. I have never spoken to one of the clan, unless it be yourself. Indeed, madam, it is a profitless matter for us to stand here talking at cross purposes. Let us have done with it! If you will not set me free, pray give me a fire and pen and ink. The time presses heavily on me in the silence here, and would pass more quickly were I employed at my writings.'

I turned to the table where my Virgil was lying, and, summoning as much *sang froid* as I had left me, I pretended to look for a page. I turned over the folios for a minute without looking up, but I knew that the daughter of Eve's eyes were fastened on the book. Perhaps she had a vague suspicion of it, of a piece with her attitude towards myself.

'It savours of rudeness to appear interested in the classics in the presence of a lady, especially one who thrusts hospitality upon me,' I said with mock gravity, and laid down the Virgil.

She lifted the little book, and turned the leaves over once or twice. 'It is in the Latin, is it not?' she asked.

'It is. In my leisure I sometimes venture exercises in translating it into English verse.'

Heaven forgive me! I could no more have written verse than I could Sanscrit, but if I could it would have mattered little. She was not in the least impressed.

She tossed the book back to the table. 'You need quiet, no doubt, for your studies. I will give orders for a fire and pen and ink; but on this condition, that you confess to me in writing everything you know of the plot against Glenira. Indeed, it will be well for you to do this. If you refuse, others shall be your judges, and in that event you shall have quiet enough, I warrant, for all the studies you wish. I will give strict orders that you must not be disturbed for two hours. At the end of that time I will send for your written confession. I look to you to have it ready. This is your last chance.'

I bowed, without making answer, and without another look in my direction she withdrew. Presently the servant (he of the tobacco hunger) came back, bringing quill, paper, and an inkhorn, and with a couple of peats under one arm. He lit a fire, and soon I was left alone again, but in better heart than I had felt since the beginning of the affair. My ruse had succeeded. The tunnel leading from the fireplace to the little cave was unknown to the household! I had two hours in which to compass my escape, and I promised myself that I would sup at my quarters in the 'White Horse' with a fine story for Walter Irving that night.

To ask for a fire was, of course, but a blind to find out if Mistress Charlotte had any knowledge of the secret passage. It was the work of a moment to stamp the peats out, and in a trice I had the blind man's packet out from below the couch.

The damp stains had obliterated all but a few words. At the top was written:

*Mary of the Angels
 should fall into the hands of . . .
 of your charitie . . . Foudelle De Boux . . .
 at Bar-le-Duc
 fifteen yards*

Here followed an indecipherable couple of written lines. Below these was what I took to be a rough attempt at a chart. There was a wavy line ending in a cone, with a rayed half-sun (whether rising or setting I could not tell) looking over it. A roughly drawn ship lay in the foreground—a wreck, canted towards the cone, with the figurehead of a woman, her hands clasped in front of her. At the top of her broken foremast was the number '15.' A simple curved line at the foot of the chart, and the words, 'Here is Fountain Reef,' and 'Here cometh High Water,' both marked with a cross,

completed the memorandum or chart or whatever it was.

I put my ear to the door. All was quiet again. The cover of my copy of Virgil was of leather, and the inside of it was unwritten upon except for my name in a corner. Writing very clearly, I copied on the inside of the cover the wording on the slip of paper, the sketch of the ship, and other lines and markings as exactly as I could; compared my copy with the original; and, satisfied that I had omitted nothing, not so much as a letter or a pen's stroke, I replaced it in its wrapping of cloth, tying it up just as it was when I took it from the sand under the boulder in the cave.

Then I wrote on a sheet of the paper the servant had brought: '*Confessions, to be of value, ought not to be under compulsion. Mine shall be of my own free-will.*' I signed my name to this with, I am afraid, something of a flourish, and laid it on the table.

The peats were smouldering with not enough smoke to hamper me as I stepped into the fireplace. The slab came away easily inwards; and, giving a farewell look at the room, I stepped over the stone, pulled it back into its place, and went down the slope of the tunnel slowly and with the quiet of a panther.

When I reached the cave I judged the tide was at the ebb, for the booming of the sea had lowered to a murmur. I could see a patch of blue sky with little white clouds chasing over it through the V crevice in the rock-wall, and the sight heartened me wonderfully. I made haste to replace the packet in the sand. Not a sound came from the ledge where the tall blind man had lowered the ladder. The place was deadly still; but as I bent over the boulder I was pursued by a dreadful fancy that the man's blind eyes saw mine, that he did not look (so to use the word) at what I was doing, but at me, into my eyes, following them, and that his own were sad and of pitiful entreaty; and I thought the face was of one whose business was nearly done with this world, almost, I could have thought, a soul tired and in extremity, dumbly asking for help. So much did this press on me during my replacement of the packet in the sand that I started not once but half-a-dozen times as though a hand had suddenly been laid on me. My self-control had been tried sorely for a score of hours, and doubtless my imagination fed on its own chill creations; but to this day I can scarcely recall the cave without a shudder. The moments I spent in that place—so still, yet peopled by shadows, every shadow endowed with the eyes of the man I had seen, those eyes, with their unspoken cry for help—abide with me still.

(Continued on page 162.)

NATURE'S BRICKS.

By H. F. HORSNAILL.

TO the mind of the ordinary man, commonly called the man in the street, the infinitely small scarcely appeals. The infinitely great is brought home to him every clear night when he gazes at the stars; and yet, though his gaze may often be but a thoughtless one, there will come at times to most, probably to all, as they contemplate the exceeding depths of space, the feeling of the incomprehensibility of it all, the mystery of infinity.

Look into yonder small black hole in the Milky Way, called by astronomers the coal-sack because of its blackness, and you gaze, as it were, through a window into fathomless obscurity; darkness there and nothing more, nothing to stay the progress of thought travelling on for ever. And, like Herbert Spencer, if you think at all, the old question will force itself upon you: '*Cui bono?* To what end is this endlessness?' But examine in the opposite direction, and we recognise that the infinitely small is just as wonderful, just as mysterious, just as inexplicable as the infinitely great.

Take a grain of any compound substance—as, say, salt—and divide it into halves, divide one of those halves again, and so keep on halving and halving as long as you can; then get a magnifying-glass, and later a microscope, and continue the process until with the help of the most powerful combination of lenses known to the optician you cannot further divide the tiny particle; the result will still be salt. But now let your thought carry on the task which eye and hand have had perforce to relinquish, and any chemist will tell you that by the adoption of suitable chemical means two halves may be formed which are not salt. Could you see them, they would be plainly different substances. The one is a metal (sodium), the other a gas (chlorine), an atom of each.

These two have been living in conjugal bliss, a happy couple, these millions of years maybe, travelling about the world together, floating in the sea, forming at times parts of the bodies of animals or fish, separating into rock and hidden away in the bowels of the earth beneath Droitwich or Cracow perhaps, for a vast period of time, and might have continued on their travels a vast period longer if you, with your ruthless chemist's knife of heat, acid, or what not, had not come and divorced them.

But now that they are separated are they what we are seeking? Are they two of Nature's bricks? Can we divide either of them again? No, it seems we cannot; no one has ever succeeded in dividing either of these into parts.

If not two of Nature's bricks, at least they have since the days of John Dalton been thought

to be; but lately we have had reason to suspect that they are themselves composed of smaller bricks still.

John Dalton, a Quaker of the city of Manchester, some hundred or so years ago struck the theory of atoms called the atomic theory, which states that each element is built up of atoms of a certain definite weight which never alters. He weighed the atoms of all the elements he could lay hands on in his day—about sixty—carefully listing them with their weights. His list has since been subjected to slight corrections due to more delicate methods and mechanism, and amplified by the discovery and addition of about thirty more elements than were known to him. There are now, therefore, about ninety—the lightest being the atom of hydrogen, and the heaviest that of uranium—all capable of joining up with each other, combining, the chemists would say, to form the two or three hundred thousand compound substances we are more or less familiar with in the world around us.

Now since time immemorial it has been the dream of alchemists and philosophers that all these substances must have some common basis, and be in the last resort composed of but one kind of atom arranged in different ways, as we out of the same bricks build a palace or a pig-sty; and that if we could but find out the secret it would be possible to turn one substance into another, and so make gold, silver, diamonds, or any other object of human desire. The attempts of these old fellows, whom we so often see pictured in dressing-gown and skull-cap, gazing with intense excitement into some retort or crucible, were mainly confined to melting and distilling various mixtures over a fire in the hope that by chance they might hit on the philosopher's stone—much as Palissy hit on the secret of white enamel—just by dogged perseverance and endless experiment.

But in later years we have dropped that plan. The first man in the field of science now is generally not the experimenter but the mathematician or the thinker. He works out a theory, and, if it seems to hold water, calls on the practical man to test it by experiment, as Adams and Leverrier called on the astronomers of London and Berlin to search for the planet Neptune; or as the late Professor Owen from a couple of fossil bones was able to forecast the size, form, and even habits of the long-extinct animal to which they belonged, and call on the collectors to find the rest of the skeleton.

In our case the man who first indicated the direction in which the path lay was one Newlands, an Englishman. He noticed that in the scale of

atomic weights as tabulated by Dalton and others there were recurring octaves, analogous to those in the musical scale, round which similar qualities reappeared in the elements situated there, only, as it were, in a higher or lower key. That it did not occur to Newlands that these qualities were repeated in this way because the atoms are made up of smaller particles in varying numbers, as musical notes are made up of vibrations, seems to us who can look back a curious fact. Why are we so slow to hear the voice of Nature telling her secrets? But so it has always been. Did not Goethe and Lamarck and Malthus all run plumb up against the idea of natural selection without really seeing it? Did not Faraday spend long months of experiment and thought in discovering the seemingly simple fact that it was not the mere juxtaposition of a magnet and a coil of copper wire which produced the electric current, but the *movement* of one to and from the other? Simple facts they seem to us who come after and reap the crop, yet they baffled the keenest brains of the world for long years.

But to return. Next a Russian, Mendeleëff, went a step farther. He drew attention to some considerable gaps in the scale, and not only foretold that elements would be found to fill them, but also stated the qualities they might be expected to possess, and, as it later turned out, with marvellous accuracy.

Many names might be mentioned, not the least illustrious being that of Professor J. J. Thomson, who worked out mathematically what would occur supposing the atoms were not the indivisible bodies hitherto imagined, but were themselves composed of varying numbers of smaller bodies charged with electricity. He showed that not only the atomic weights but the qualities of the elements might be accounted for on such a hypothesis; that octaves such as Newlands had pointed out would appear; that some arrangements would be stable and some unstable, thus providing a reason for the remaining gaps and the intermittent instead of gradual progression of the scale; how current electricity might be explained; and, in fine, demonstrated how light would be thrown on so many, at that time, knotty problems that it is wonderful his paper on the subject did not gain more attention from men of science than was its fortune. One may liken his idea of an atom to a clubroom where members keep dropping in to enjoy themselves. At first two enter. Finding no one else, they start a game of draughts; and so long as there are but two, draughts is a stable arrangement. Soon another turns up and wants to join; draughts becomes unsuitable—that is, unstable—and nap is resorted to. The appearance of a fourth suggests another change, and bridge is substituted. When a fifth enters, bridge becomes unstable. And so on, each of these different games repre-

senting a different element—the room an atom, and the players corpuscles, as Professor Thomson named them, or, as they are now more often called, 'electrons.'

This paper, as has been said, excited at the time but little attention; it was looked on as the brilliant dream of a brilliant dreamer. Not long after, however, the practical man came along in the person of Professor Henri Becquerel, who, experimenting with Röntgen rays, then lately discovered, stumbled on the fact that some ordinary substances in their ordinary state were radio-active; that is, they gave out rays which would affect a photographic plate even though an opaque screen were interposed.

Pitchblende, a mineral which contains a good deal of the rare metal uranium, was the compound which whispered this secret to Professor Becquerel, and through him to the world; and amongst others who at once began to experiment in this new direction was Madame Curie, wife of Professor Curie, a noted French savant. She thought it might be possible to separate the substance which gave out these rays, if rays they were; so, obtaining some samples of pitchblende, she set to work on the problem. Her results were so promising that Professor Curie joined her in the search, and after much labour and expense they obtained, though still only in a very impure state, that most wonderful of modern discoveries 'radium.'

It is not, however, so much with its wonders that we have to do in the present article, though it was undoubtedly through them that this subject of Nature's bricks came again so prominently to the front. For, owing to the fact that it seemed to upset the great law of the conservation of energy, a law which states that Nature, like other good economists, gives nothing for nothing, but will exact her full *quid pro quo* for services rendered, and one which has been, as it were, sacrosanct since it was first enunciated through the labours of Helmholtz, Joule, Lord Kelvin, and others—owing to this startling fact, the eyes of all the physicists and chemists of the world were at once turned upon it. They hastened to discuss, theorise on, and experiment with this rebel against law and order, and the electrons which had hitherto existed only in the imaginations of men like J. J. Thomson and Clerk-Maxwell were found to be realities, and were quickly weighed, measured, counted, and everything discovered about them that an army of trained scientists could discover. It was then that Professor Thomson's paper was seen to have been, if a dream, yet one with an interpretation, and it jumped at once into prominence as the best hypothesis yet put forward as a solution of the problem of the constitution of matter.

Now let us briefly state what we so far know about these little fellows whom the world has been hunting for so long, and who have caused

so much stir that they have now been run to earth.

Firstly, then, they tear about at the incredible average speed of something like one hundred thousand miles per second, racing to and fro, circling in orbits, swinging in ellipses, banging against each other, all, as is supposed, inside the atom to which for the time being they belong. Perhaps it would be more correct to say thus forming the atom to which they belong; for a group of electrons revolving about a common centre *is* an atom, just as our own sun and planets, asteroids, and comets form together a complete self-contained system, and for all we know an atom may be, and not improbably is, very like a tiny solar system; for Nature not only in that part of her domain called history, but in all directions, is apt to repeat herself. Her progress is in spirals; she comes round again to the same place, only higher up.

Each of these electrons carries with it a charge of negative electricity, the charges of all of them being exactly balanced by the same amount of positive electricity carried by the atom itself as a whole. Sir Oliver Lodge likens them for size to grains of sand in a church, the church being the atom; but one cannot really talk of size in the matter, for here again we may compare them to the solar system. Is it bounded by the orbit of Neptune, or does it extend to the farthest point reached by Halley's comet in its seventy-six years' period? Its size is the range of its activities.

Electrons, then, are just points of force, centres of electricity; indeed, so far as we can tell, they *are* electricity and nothing else. It seems a strange idea that everything we see is simply electricity, racing about at lightning speed in myriads of tiny points. Alive, are they? Well, it looks like it; anyway, to say they are alive expresses better than anything else what seems to be the fact. As to their weight, they are a thousand times lighter than the lightest atom we know—that of hydrogen. To express it in pounds would cross our page with decimals.

Now the peculiarity of radium is that some of its atoms—to return to our simile—are always changing the game.

Let us picture again an atom of radium as a set of people playing bridge. They are, we will suppose, playing for money. One of them has a run of ill-luck. Having lost all his money, he gets wild, and, suddenly jumping up, kicks the table over, and, striking out right and left, runs amok out into the night. This is what is continually happening in radium; a constant stream of electrons (unlucky players) keeps madly bolting forth from it, charging and hitting everything they come against, and naturally producing heat in their excited rush. One after another the atoms break up, and as the electrons which formed them fly off, the total mass is of course reduced. But the original number of atoms is so prodigious

that it is calculated that some fifteen hundred years would elapse before any given portion of radium would be entirely dissipated.

What becomes of these outcasts? Well, it seems after they have left the main body they quieten down a little, and, recognising some of their companions in the same case, decide to settle down to a new game, needing, let us say, only three players instead of four; that is, they reappear as a different element, for it is a fact that the emanations from radium, when collected and tested, are found to be helium.

This, of course, is the wonder of it. If radium turns to helium, why not into gold, silver, or anything else? Radium into gold would be but a poor exchange, seeing it is many thousands of times more valuable, weight for weight. But why not lead, iron, tin also into gold?

Hey, presto! and the thing is done. If we have discovered the bricks, why can we not build what we like with them? So far as we know, they are all alike—some travel faster, some slower; each and all are endowed with an exhaustless energy, and hurry on their paths either alone or in groups towards—shall we say?—‘that far-off divine event to which the whole creation moves.’

These, then, are Nature's bricks with which she builds a man or a midget, a blade of grass or a star-cluster.

Some nervous people have stood aghast at what will happen when all our coal and oil is used up. Here, could we but tap it, lies waiting a vast store of power—enough, as Professor Duncan in his *New Knowledge* says, ‘in every breath we draw to drive the workshops of the world.’

Every atom of every substance is a centre of immense forces in equilibrium; so long as they remain so we scarcely even suspect their existence. If we could but draw on this store at will, what Herculean tasks could we not perform?

Take two rods of steel; place them end to end; endow them in imagination with an immense rigidity so that they can stand the strain; then press them against each other with a force of, say, ten thousand tons. What happens? Nothing! The force is latent; you cannot by any means detect it. But now, while still keeping up the pressure, strike one of them a little to one side at the point of juncture; it is easily done. ‘Gee whish!’ as brother Jonathan would say, they rush past each other and off into space at a speed many times faster than the fastest rifle-bullet. You have disturbed the equilibrium, and woe be to whatever lies in the path!

Such are atoms, whether singly, or in groups called molecules; terrific forces in perfect balance. We are able now in certain substances to upset this balance. In dynamite, in gunpowder, the rods are not quite plumb—they only just hitch, as it were, by the very skin of an edge; a touch

with a hammer, and gigantic forces are let loose. We call it an explosion. So swift and powerful is its action that tons of solid rock are hurled hither and thither before the air, light and movable as it is, has time to make room for the myriads of excited atoms and electrons suddenly set free, and yet not a tenth, probably not a hundredth part, of the forces hidden in that charge have been used. Besides, it was only dynamite. 'Only,' do I say? Yes, for the combustion of radium, if complete, is calculated to set free, weight for weight, three and a half million times more energy than any other known chemical reaction; not, please notice, because it

is radium, but because in radium only has it shown itself and been measured. Other elements, in varying degrees, also possess it. They have kept the secret, and keep it still; this one only has blabbed. Some day we shall be able to tap these tremendous forces, and coal, steam, and petrol will be looked on much as we now look on the hand-loom, the tinder-box, and the cross-bow.

The possibilities hid in the chrysalis of the future are in all directions inconceivable; but in this one the wildest dream of to-day may become the commonplace of a perchance not so distant to-morrow.

ITALIAN BRIGANDS.

By GEORGE PIGNATORRE, B.C.L.

UNLIKE the Greek Klephts, who were the Herewards and Robin Hoods of modern Hellas, the Italian brigands were, with few exceptions, discharged mercenaries or deserters, braves out of employment, or the executors of some deed of vengeance; but ordinary malefactors were in a minority. Although outcasts of society, banded together for plunder and outrage, preying on their own fellow-countrymen, and not always sparing the poor hinds of Romagna, of Puglie, Sicily, and Sardinia, they represented a certain ideal of hardihood, independence, and resourcefulness in danger that rendered them objects of admiration as well as terror to an ignorant, servile population. The swagger, reckless daring, and lavish expenditure of these outlaws exercised an irresistible sway over the lower orders, who beheld in them the avengers of their own wrongs on the powerful and wealthy, and men who faced and braved the hated *sberri*, police spies, and officers of the corrupt judiciary. With all their crimes, the brigands embodied the only surviving manly element of a vicious, emasculated, down-trodden population. By the effeminate, spiritless nobles and worldly prelates, these bold robbers were held in awe and treated with some respect. Even men like Antonio Schiavoni and Domenico Tiburzio—who laid whole districts under contribution, plundering, ravishing, and slaying without distinction patrician and plebeian, rich and poor, layman and clerk, and inspiring terror among all classes—were admired because of their hairbreadth escapes. The notorious Gaetano Mamone, a very fiend in human form, if half the extant rumours of his evil deeds be true, was redeemed from infamy under the ægis of the Church; for, incredible as it may seem to us, this monster of wickedness and lust, who, it is said, even drank the blood of his captives, received a command in the army of the Holy Faith which marched on Naples in 1799, under Cardinal Ruffo, to restore the dispossessed Bourbons. Never was there a more savage, brutalised

host than that which warred under the banner of the Church, slaying, torturing, and burning on their march from Reggio to Naples; and, of all the individuals composing the following of the cardinal, no one exceeded and few equalled Mamone in wanton cruelty. Yet this man was honoured by King Ferdinand, who granted him a liberal pension for life for his loyal services, and placed him on the list of retired officers; and he died in his boots, instead of being shot down or 'dying quietly by suffocation,' to use the phrase of Captain Dalgety.

A minority of the brigands—the least objectionable ones, who followed the best traditions of the criminal career—assumed the rôle of redressers of wrongs, defenders of the oppressed, and champions of distressed damsels. Such was Giuseppe (or Joseph) Magno, nicknamed the Brigand of Marengo, who was the sworn foe of tyrannical fathers, who had at his bidding to loosen their grasp on rebellious daughters whose true love he favoured, and of grinding landlords whose rack-rents he set aside. He had, of course, in enforcing equity to break the law; but, as his reputation grew, like Tom Faggus he very rarely had recourse to violence, as his orders were usually obeyed without demur. It is said of Magno that even the great Napoleon did not deem it derogatory to interview this celebrated bandit to arrange some *modus vivendi* or other amicable arrangement, in which the great monarch was as successful as he had been in conciliating the *Chouans*. Giuseppe Magno dealt leniently and at times even generously with all classes of men save one: he was relentless in exacting to the last farthing the public money from officials; and the money was appropriated without scruple, for in the 'good old times' collectors or farmers of the revenue, from which they derived a percentage of profit, were universally regarded by the populace as so many authorised despoilers, and when they were lightened in their turn the action represented the spoiling of the spoiler. The

vulgar throng ascribed to such renowned brigands supernatural powers, which aided them in their achievements and escapes.

A good story is told of the Sicilian brigand Bruno, who had seized the proceeds of the city tax, or *octroi*, and captured the solitary carbineer who had pluckily remained at his post, and whose life he had spared either because he admired the carbineer's bravery or because he had thought of turning the capture to account. Bruno, after amicable conversation with his captive, quitted him, leaving behind his own carbine; then, after walking a few paces, he returned for his weapon. The carbineer, who was neither bound nor guarded, was on the watch; and, seizing the carbine, after some hesitation levelled the weapon and fired point-blank at Bruno at the moment he was re-entering the cell or chamber where the carbineer was confined, but with no other result than to scorch the brigand's vest! Bruno, quite unmoved, calmly told the man he should have used a silver bullet instead of one of lead. Bruno had, of course, baited the trap into which the carbineer fell; he had sufficient knowledge of human nature in general, and of Italian nature in particular, to foresee that self-interest and ambition, under the convenient cloak of duty, would outweigh any sentiment of gratitude for a life spared, or any honourable reluctance to fire on an unarmed, unsuspecting man; and the event proved that he was right. It was no part of his plan to detain or punish the carbineer, whom he released, and who issued unscathed from the lion's clutch to spread the report that Bruno was, like Claverhouse, bullet-proof. The carbineer knew that it was impossible to miss his man, but he did not know that Bruno had drawn the charge.

Another famous outlaw, Cirico Annichiarito, of the Puglia, was credited with a 'familiar' whose mission it was to gather and report to his protégé all useful information respecting the movements of troops, the existence of hidden treasure, and even the country gossip when its topic was Cirico. This popular belief was very natural to a superstitious peasantry, who were wont to attribute to magic or miracle what they could not understand—namely, the secret of his wonderful information as to the movements of his enemies which had always enabled him to slip through the toils and to execute many a daring exploit. Every man doubted his neighbour, and spoke with bated breath of the redoubtable bandit. The truth was that he was well served by his numerous friends and adherents, who gave him such accurate and timely information that he was always forewarned and consequently forearmed. His intelligence department would have been a credit to many a Foreign Office. Nevertheless he was fated to fall at last into the hands of justice, that stern justice which Sir Richard Church meted out to

brigands and malefactors when viceroy of the Puglia in 1817. This energetic Irishman—one of those men of action we ought to be proud of, but conveniently forget—crushed brigandage for a time, and even annihilated those formidable secret criminal associations which Italians are such adepts in forming.

Among these men, one or two tower pre-eminent, and are distinguished from their fellows as men who had taken to a lawless life as free-companions rather than as freebooters, not vulgar criminals, and were stout soldiers and skilful leaders. One Ghiro di Fucco, who lived in the latter half of the thirteenth century, became an outlaw by compulsion on account of a blood-feud between his family and that of a powerful feudal lord. He could muster a following of four hundred men-at-arms, and served under the banner of King Manfred, the Harold Infelix of Italy, against Charles of Anjou, and is mentioned by Dante in his *Inferno* as a Ghibelline. He died in his fastnesses among the purple Apennines. Ghiro is also mentioned by William Guerrazzi and other authors.

Another notable robber was Mark Scarra, who flourished in Romagna during the reign of that terrible old pontiff Sixtus the Sixth, the stern justiciar of all law-breakers, who endeavoured to track him down, and even, it is said, disguised himself as a mendicant friar to effect his purpose; but Scarra proved as elusive as Acchiarito, and was too much for the fierce old Pope. He had been a soldier of fortune, and had betaken himself to seizing travellers on the highways and holding them to ransom as a temporary occupation in lieu of a better, or because he wanted a change of air; and now, to evade the pursuit of the Pope's bloodhounds, he escaped over the frontiers of the Papal States to the territory of the Venetian Republic, and took service under the Serenissima (the title assumed by the republic), and rose to some eminence as a leader of free-lances and other mercenaries of the State.

In fact, these half-bandits, half-soldiers were a kind of connecting-link between ordinary brigands and the chiefs of the free companies who, like Hawkwood and Montreal Wetter, warred equally against society and levied contributions on cities instead of individuals, and could muster thousands of men instead of scores—in short, who committed on a large scale the same systematic depredations as the ordinary freebooters carried on.

Among the latter-day brigands, a certain Francatrippa deserves mention for his ingenuity in exploiting to advantage the popular superstitions which dominated all classes in Italy at that time, and still exist very widely. He succeeded in passing himself off as the devil to an old female usurer and frightening her into yielding up her ill-gotten wealth; and then at a later time

handing to him, disguised as a monk, the gold and more portable articles of value for the Church. Another gentleman of the road, Guarzini by name, contrived to secure very comfortable and roomy quarters for himself and his band by working on the superstitious fears of the widow of a grasping money-lender. Wrapped in a winding-sheet, the appropriate and orthodox costume of spectres of the period, and dragging a long and heavy iron chain, Guarzini made his way into the fine country villa occupied by the relict of the usurer, to whom he presented himself with a due accompaniment of the clanking of chains, crying that he was the spirit of the departed usurer, haunted by devils, and that this was his doom until she should quit a dwelling acquired by evil practices. The first visit was unsuccessful, as the widow was naturally loath to agree to eviction even at the request of the spirit; but on a second appearance she cleared out, leaving the ghost in possession, and he became henceforth a life-tenant, and the whole band was soon housed for the winter.

It will be seen that in all these devices to extort property of various kinds there was more craft than violence, and no actual cruelty; but the following gruesome story of Gasparini has a dash of ferocious pleasantry peculiar to the man. The bandit had captured at one stroke the city council and the magistrate of a small town, and demanded a ransom for each captive graduated on a scale corresponding to his official rank. The whole commune replied that they could only consent to give a third of the ransom demanded for the mayor, one-half of that demanded for the *bargello* (chief executive officer), and nothing for the justice. Whereupon the magistrate was forthwith hanged, the *bargello* cut into two parts, and the mayor into three; one half of the *bargello* and a third of the mayor being sent back. Gasparini seems to have been after the type of Tibursi rather than of the milder Magno and Bruno; though he fell short of the infamous Mamone, and of Michele, who earned the nickname of Fra Diavolo, by which he is commonly known, and his name has still a stirring sound to the youth of Calabria, Sicily, and the Abruzzi. These malefactors, like the Dick Turpins and Jack Sheppards, are popular heroes, and share with great patriots such as Mazzini, Ugo Bassi, and Fratelli Bandiera the favour of the

public; the local saints exercise but a languid interest among the rising generation in comparison, for their sayings and doings are rather antiquated; whereas those of the outlaws are almost up to date.

The latest brigand of whom his admirers feel proud is Musolini, a Calabrese, whose charge-sheet contained, if I recollect aright, some seventeen homicides of various grades. He defied for over a year all efforts to capture him, although a whole battalion had been sent to run him down; and I believe it was by a mere chance that he was captured at last. His trial was dragging on slowly when he died of consumption, leaving behind him a reputation second to none.

Salomone, whose trial is pending, can boast of a record little inferior, and his sentence will probably be a heavy one, relatively speaking; for in Italy, where capital punishment has been *de jure* abolished, and imprisonment for life *de facto* obsolete, he will, if convicted, be condemned to a shorter or longer term of penal servitude, which is always further abridged in practice by the penalty being partially or wholly remitted. These frequent commutations and grants of free pardons may be considered a set-off against the long period of preventive imprisonment preceding and pending the trial, which frequently lasts two years or more.

These men, however, being solitary individuals, and not the chiefs of armed bands, do not affect the public security or the safety of foreigners who have no part in family feuds. The era of organised brigandage has passed away for ever, but its spirit still survives in the habits and sympathies of the people. The secret criminal associations which find their headquarters in Italy are at present far more menacing to public security, and they have struck roots too deep to be easily eradicated. Such are the infamous Camorra of Naples, the Mani Nera of New York, the Maffia of Palermo, the militant anarchists who have furnished more than half the regicides. Caserio Brescio, Lucchesi, &c., the assassins of the French President Carnot, of the Empress of Austria, of King Humbert, were all Italians. But a discussion on this subject would lead too far, and exceed altogether the limits of this article.

RETURN OF POSTED LETTERS IN BRITAIN AND AMERICA.

ACCORDING to British law, letters while passing through the Post-Office are the property of the Postmaster General, and applications for their return after being posted cannot be complied with. No postmaster or other

official has any discretion whatever in the matter. In the 'declaration' which postmasters and others are obliged to make on entering the service they solemnly declare that they 'will not open or delay, or cause or suffer to be opened or delayed,

contrary to their duty, any letter that has been posted.' The rule on the subject—which, of course, does not apply to letters that cannot be delivered, as they are returned through the Returned Letter Branch—is thus a very strict one, and any breach of it would certainly be followed by serious consequences to the person concerned. The public have full confidence in their letters being retained by the Post-Office, and in due course despatched. The importance of retaining this confidence is fully recognised by the postal authorities; hence no discretion in such cases is permitted. Were it otherwise there can be little doubt that attempts by dishonest persons to obtain letters that did not belong to them would be frequently made, and consequently the sender of a letter could never be certain that it might not be procured for some sinister or improper purpose.

But in the United States of America the practice regarding letters is entirely different. Postmasters there must receive such applications, and on the applicant complying with certain regulations the letter must be handed out. Not only so, but provision is made for obtaining the return of a letter from another office, after it has been despatched, including the office of delivery. The regulations require that the applicant shall furnish a written address in the same handwriting as that upon the letter sought to be withdrawn, and such description or other evidence as may be necessary for its identification, thus satisfying the postmaster that he is entitled to withdraw it. Application may be made on behalf of, not necessarily by, the writer. The discretionary power of granting or refusing the application rests entirely with the postmaster. It is necessary, also, that a form of application should be filled up, on which, besides the particulars described, the applicant is required to state the reason why he does not desire the letter to be delivered, and he undertakes 'to protect the postmaster from any and all claims that may be made against him for such return, also to fully indemnify him for any loss he may sustain by reason of such action.' Registered letters can also be withdrawn in a similar manner, whether before or after their despatch; in the latter case by mail or telegram at the expense of the applicant. Of course such particulars as may be necessary for the identification of the letter are given. Not only can letters for foreign countries be similarly withdrawn, but provision is also made for their address being changed, provided the legislature of the country of destination allows such withdrawal or alteration. In such cases the compliance of the foreign postal administration will be requested by the Postmaster-General. In this connection, however, it is specially pointed out that the legislatures of Great Britain and certain of its colonies, also those of certain foreign countries, do not allow senders of

letters to withdraw them from the mails or alter their address. It may be mentioned that in America parents and guardians have also the right to withdraw letters of minors. This should be remembered by ladies, and gentlemen also, under twenty-one years of age, who may be disposed to indulge occasionally in clandestine correspondence!

Presumably the system of withdrawing letters, as described in this article, is popular in America, or it would not be allowed to exist. The Americans are an intelligent people, and it must be concluded that they know what is good for them; but the wisdom of giving entire discretionary power to postmasters of every class throughout the country to deal with applications for the return of letters may be questioned. The system would seem to be a direct encouragement to dishonest or evil-disposed persons to endeavour to procure letters that do not belong to them; and however desirous postmasters may be to detect unauthorised applications and to protect the public, there can be little doubt that sometimes they are imposed upon. The system would certainly not be permitted here, nor ought it to be. Nothing should be done to lessen the confidence of the public in the impossibility of procuring letters from the post-office after they have been posted.

HYMN FOR THE BROTHERHOOD OF MAN.

GOD keep and strengthen at this hour
All hearts confiding in His power,
That through this fratricidal strife
Lift upward to the Lord of Life
The cry that is with anguish riven:
Thy will be done in earth as heaven.

Breathes on a world benumbed and bowed
His benison behind the cloud;
And out of death and grievous loss
Streams the far solace of the Cross!
Can words than Christ's more precious be:
Thy loved ones are made one with Me.

To some, the soldier's couch of pain,
Amid the shattered and the slain;
To some, pangs sharper than the sword,
Who wait the reaping of the Lord.
Yet over fate, all chance above,
Lo! He who ruleth rules from Love.

Oh thou of weak and faltering faith!
The Comforter hath conquered death.
Oh thou of strong and rebel will!
God chastens not but to fulfil;
For where thy chiefest treasure lies
There will the heart make sacrifice.

Never again may tyrant mar
Friendships and links that tenderer are,
Nor war-lord unto war-lust fan
The mighty brotherhood of man!
Peace, happy Peace, the wide world through,
Till Christ His second reign renew.

THE ROMANCE OF REFRIGERATION.

By W. S. DOUGLAS.

THERE is a romance in fire and heat. Prometheus stole it, the Vestal Virgins kept it burning on the sacred hearth, and through all the days of old the sacrificial altar and its flames kept alight the fire of religion and of faith among the people. But fire is now a commonplace, and in these topsy-turvy days we seek our romance anew in the modern and scientific process of refrigeration.

The real history of refrigeration began in 1879, when the steamship *Circassia*, using the Bell-Coleman machine, carried the first cargo of frozen meat successfully from America to England. Scientists had experimented for many years previously, but it is only since the achievement of the *Circassia* that refrigeration has become really practicable. At the present time the freezing-machine is a thing as thoroughly understood as the steam-engine. Your manufacturer will forecast what it will do within a hair's-breadth.

The machine itself is ordinary enough in looks, and for that reason is not perhaps so romantic or so popular in its appeal as a torpedo-destroyer, or a flying-machine, or the antennæ of a Marconi station; but, for all that, there lies in its application a whole world of hidden romance and, what may possibly be better, of sterling usefulness. There are strange contrasts about it. It will slog away patiently at cold storage; it will alter entirely the set of the world's trade; and then it will liquefy helium for you, it will reduce the cost of steel, and it will break the grip of syndicalism.

To begin with its ordinary uses. In the first place, as every one knows, it has given us cold storage, which has regulated once and for all the food-supply of the world. Cold storage is to food production what the flywheel is to the engine. The flywheel stores up energy when too much is generated, and gives it out when too little is at hand. So also cold storage stores up food in the fat months, and gives it out again in the lean ones. If refrigeration has not conquered, it has certainly tamed, Mother Nature. Says Nature, 'I will give you apples in the autumn, and I will grow them for you in Canada. I will give you beef and mutton in abundance, but you will find them on the pampas of the Argentine and in the bush of Australia.' Man cries,

No. 220.—VOL. V.

'What shall I do? Beef and mutton must perish before the fastest ships can convey them across the seas to England. I want my apples in the spring, and I like my ice in the summer.' Science steps in, and says enthusiastically, 'I will give you a freezing-machine.' Only the poor dock-striker and the syndicalist are left disconsolate. When food can be stored for a year, and remain just as good as when the year started; when the man eats a beefsteak twenty-six years old, what avail their cries and strivings? Even bread is to be kept fresh; and butter, eggs, hops, meat, milk, fruit, vegetables have already quasi-eternal youth.

Cold storage was once the principal task of the freezing-machine, but it is now used almost as widely for the manufacture of artificial ice. It will give you ice in any weather; it will store it for you till you want it; and it will make it in lumps of whatever size you please, either opaque like lake ice, or crystal-clear, so that you can see through two feet of it as through a pane of glass. Nothing perhaps more emphasises the paradox of refrigeration than to stand and look at an ice factory while coal goes in at one end and blocks of ice come out at the other.

This is the ordinary work of refrigeration, but let us hasten on to the fine frills and embroideries of the subject. It is here, if anywhere, that we shall reach surprises.

In the scientific world there is the work of Cailletet, Pictet, Dewar, Linde, Siemens, Onnes on the liquefaction of gases. We have solid hydrogen as a lump of clear ice, solid air as a jelly at temperatures fabulously low, and recently liquid helium at a temperature equal to 483 degrees of frost, or eight degrees above the absolute zero. We have egg-shells and ivory paper-knives, dipped in liquid oxygen, glowing in the dark with unholy lustre; and we have liquid air used to produce oxygen to feed our magic-lanterns, and nitrogen to make artificial manure for our farms. Man, to feed himself, liquefying the atmosphere!

The woman of fashion uses refrigeration for her own ends. Her priceless silver foxes, her invaluable sables, are stored throughout the summer for her in big cold rooms where moths corrupt not. The society hostess wishes rare

flowers at the wrong times, and cold storage flies to her aid. By its agency you will see in January lilies of the valley, some of which should have bloomed in the May that is past, some which should bloom in the May that is to come, flowering side by side.

In the hospitals, if a lengthy dissection or *post mortem* is to be made, the body is cold stored; and in the Morgue of Paris corpses are kept for weeks to allow relatives the melancholy pleasure of identifying them. Bacteria in scientific laboratories are prevented from propagating by the same agency, and ice-rinks are kept open all summer.

In industrial processes the applications of the freezing-machine are varied. Bacon is cured, beer is brewed, chocolate is set, and milk is freed from germs by its aid. In the last-named case the milk is first pasteurised, or heated to a temperature sufficient, as we know from Dr Pasteur's experiments, to slay all the unfortunate bacteria. It is then cooled to keep them from re-establishing themselves, and the demons of tuberculosis must retire in utter rout and disorder. With refrigeration, lard (horrible thought!) can be imitated to a nicety by mixing oil and fat; and disasters such as the terrible explosions on the *Jéna* and the *Gloire* can be avoided by the cooling of the magazines on warships. If all refrigeration had done had been to obviate the sights that were seen in Brest and Lorient when the dry-eyed Breton women watched the biers, draped in the tricolor, pass behind chanting choir boys to the cemetery, it would have amply justified itself.

Amongst the other deeds of the freezing-engineer may be reckoned fully one Carnegie Library the more given to the nation, and not built with sweat either, for refrigeration has reduced the cost of producing steel in Pittsburg by, it is said, four shillings the ton. The para-

doxical way of doing it is to cool the air which feeds the blast-furnace, and so get more heat from each pound of coal, for the reason that cooling the air freezes out the moisture in it. Another case where the machine is useful in freezing out moisture is in sinking pit-shafts or boring tunnels through wet or porous ground. In such a case it is easier to freeze the water into a solid ice wall by means of a freezing-machine than to pump it out.

Finally, the freezing-machine has rendered life bearable during hot weather in all sorts of places—theatres in Cologne and Buenos Aires, the Stock Exchange in New York, hotels in Chicago. Maybe, one of these days, we shall do that in Britain too.

The actual principle of the machine is simple. It depends on the fact that when the liquid boils and turns into a vapour it makes its surroundings cold by abstracting heat from them. Hence, if the liquid is caused to boil inside some coils, which are placed in the interior of a cold store (with good thick walls to keep the 'cold' in), it will steal heat from the said cold store, and from the objects—say shoulders of mutton or sacks of apples—which the cold store contains. Thus both the store and its contents will become cold. It follows that all the machine has to do in order to work a cold store is to make a suitable liquid boil inside the coils of piping mentioned above, and for this purpose you require a pump. The pump sucks at the coils till it makes the liquid within them—generally ammonia, sulphur dioxide, or carbon dioxide—boil freely and enter the pump as a vapour. The same pump then discharges the vapour into a condenser, so that it can be recondensed into a liquid, which is squirted once more into the evaporating coils, and used over again without wastage.

The refrigerating machine is, in fact, a gratifying realisation of the theorist's dreams.

THE BRIGHT EYES OF DANGER.

CHAPTER XII.—A NEAR THING.

THE moments were speeding, and I had none to lose. I swung the boulder back into its place, covering the packet, and went immediately below the breach in the rock-wall. The face of it was worn smooth as an egg by the tireless hand of the tides; but I clambered up by the little footholds, swung through the entrance, and found myself in God's daylight. Some half-a-dozen feet below was a narrow alley of shingle, bordered on either side by rocks of medium height, slanting up above me, ending in flat tops where I could see green turf and here and there brackens stirring in the breeze. There was no human being in sight. The place looked lonely enough; but I knew that The Garth could not be far behind me, and at the

thought I drew back in apprehension from the edge of the ledge where I stood, and reviewed my situation. There was the merest semblance of a footpath curling up to the top of the rocks. Indeed, it was scarce more than an old sheep-track; but it had two virtues, it was evidently rarely used, and from half-way up it was overgrown by shrubs and brackens. To descend to the shingle would have been easy; but I knew not what might confront me there. For one thing, my steps would sound harshly on it, carrying a danger of rousing suspicion or curiosity, to lead to I knew not what, were I discovered and carried back to The Garth. I was more inclined to make for the summit, where at least I could go without tell-tale noise,

and there I could make shift to hide while I looked around me and took my bearings. One thing was clear. I could not waste time standing where I was. I took the track upwards, and ran crouching until I got to the screen of the brackens, when I dropped and crawled on hands and knees, threading my way cautiously up until I reached the top. Then I struck off the path, lay down in a thick cover of bracken, and peered about me. Luck was with me. I could see the alignment of the shore below me, the tide fringing firm-looking sand that lay white in the sun, and away beyond the hills of Fife and the ships moving on the Firth of Forth. The wind blowing the smoke over Edinburgh showed me in a measure where I was—somewhere, I hazarded, about eight miles eastward from it. Below me the disposition of the rocks formed a little pan-shaped cove, its handle a great crooked fissure, its floor covered with shingle and rocks.

A little way off the chimneys of The Garth peeped over the trees. But for the events I had stumbled on I would not have given the place a thought except one concerning how to get as far from it as possible. The outlook towards the sand and the sea engaged me; but The Garth, with its blank windows and its air of neglect and reticence, invited no second glance from the beholder, unless perchance he might wonder at the dejection and silence that hung about it. The air of the morning was inexpressibly sweet after my confinement. I could have lain in the bracken breathing it for long enough; but the thought that at any moment my escape might be discovered haunted me. I pictured the ragged Highlanders quartering the links for me. Unlike them, I had no weapons, and the prospect of a bullet or a dirk in me sent a rustle through my blood.

I was just about to crawl back down to the shingle to try my luck along the sands toward Edinburgh, when a sudden clamour of sea-gulls rose, and a flock of them wheeled and dipped, their wings twinkling in the sunlight in seemingly aimless activity not far from where I lay, near the edge of the little cliff. On guard, I crouched again, and, at the moment, a hand and arm appeared over the ledge of the cliff. A head followed, and a man clambered up and looked around him. He was so near me that I could see his face distinctly, and hear his heavy breathing after his climb up the rock. For a moment or two he seemed to hesitate, and then made straight for a little company of trees. I watched him get behind one of them, when he drew forth a spyglass, rested it on his wrist against a tree-trunk, and began to sweep the Firth. The ships and the sea occupied his attention for a moment only. Turning the glass toward The Garth, he spied steadily for a time, lowered it, and looked about him leisurely. There was a coolness, a delibera-

tion about the man that interested me. Without hurry, sauntering like a man taking the air, he came down the sheep-track, humming a tune to himself. He was a slim, good-looking youngster, delicate of feature and almost delicate of frame, but clean-built, carrying himself well, a touch of modishness in his dress, a small sword swinging at his haunch. His careless air of strolling might, I thought, be studied, a part of his morning's work, whatever it might be, for his eye ranged all around him, alert as a bird's. I was not without suspicion; and, to put the coping-stone to my thoughts, just as he came within a few paces from where I lay he stopped, took out a pistol, examined the priming, concealed the weapon on his person again, and resumed his saunter through the bracken.

The singular, disquieting act sent my thoughts on a fresh current. The man knew something concerning the House of The Garth. Whether he meant harm to its inmates I could not tell; but, although I had been loaded with indignities there, and had been under menace of my life, two visions arose, one of the sad blind giant, and the other of the girl's face in a rain of tears, and at the thought of any peril to her its single issue prevailed. Danger was here my neighbour, perhaps my friend. Who could tell? Something beyond and above me, beyond reason, routed the thought of turning my back on the house. Crouching low, I followed the man.

He struck off the track and into the bracken, where, coming to a hollow, he put the spyglass in use again. The house was now plainly to be seen, not a feather of smoke coming from the chimneys, the only signs of life a few crows lurching in the wind in and out of the trees. The man kept the spyglass to his eye for long, scanning the place patiently. Once, I thought I saw a flutter of white at one of the windows. He rose, looked once swiftly around, and, making a détour that avoided crossing the open green space in front of the house, disappeared into the wood beyond. I crept half-way after him. He must have received some signal, for suddenly he emerged from the wood, and walked erect swiftly and without concealment straight towards the house. As he did so, the door opened, and the girl stood open-armed. He took her in his arms, and for a moment I saw her head on his shoulder, his arms about her, and heard her, broken, weeping words of welcome. The great door closed with a clang. As for me, the warm glow that I had felt about my heart but a few minutes before died as suddenly as it came. A black cloud lay on my spirits. I lay a-thinking too long on many things, until the thought rushed over me like a rousing douche of cold sense that there was every chance of the stranger—the girl's lover (the words stuck in my throat)—being told of my capture. Mistress

Charlotte would doubtless be impatient to receive my promised confession. I pictured their visit to the empty room. There would be a hue and cry, and here was I crouching within a pistol-shot of the accursed house. Upbraiding myself for my wool-gathering wits, I doubled hastily through the wood, and reached a footpath behind the house that led to the stable-door.

It was slightly ajar, and the sound of a snore reached me. I peered in. The red-haired servant was lying on his back, sound asleep on some straw. To my great joy, the mare was there, bridled, but the saddle was nowhere to be seen. I tiptoed to the stall, and the good beast well-nigh ruined my plans, for she whinnied aloud for joy, and just as I had loosened the halter the man awoke with a start and saw me. Before he could voice the astonishment I saw in his eyes, I was at his throat. He was a powerful little brute, and struggled like a wild cat. We swayed together in a grim embrace, his hands at my wrists clutching them like steel grips. Could I hold on to his throat until he was past raising an alarm? Suddenly he let go one hand and tried to stoop for his skean-dhu, the little black knife that the Highlanders carry. It was his undoing. I had him thrown over my shoulder, and the skean-dhu fell with a clink. I picked it up, as he came to the ground with a groan and lay stunned, not a moment too soon, for my ear caught the sound of voices and a door opening. I led the horse hastily out, mounted, and put her down the path at a gallop. As I turned the corner, I saw with the tail of my eye two or three people coming at a brisk run, led by the youth I had watched in the bracken. I gave the mare a prick with the skean-dhu, the first and last time I used spur of any kind to her. She shot forward. On the instant a couple of pistol-shots rang out in quick succession. The horse squealed with pain, plunged, and for a tense moment I feared she would falter and come down. But the bullet served my pursuers in exactly the reverse of their hopes, for the beast fairly

bolted. It was the best thing that could have happened. I let her go. Indeed, I had no option. All I could do was to make myself as small a target as possible, and strive to keep her on the path. I heard another shot; but, unless she stumbled or was badly hit, I felt that I was out of danger so far. I have never ridden at such a pace. The hottest burst I have ever had with the Eskdail was child's-play by comparison with my bare-backed ride for life. Once I was nearly jerked off by a branch as we crashed through a coppice. The road flew under me. I passed several foot-passengers, who scattered like fowls at my approach, standing by the roadside to stare open-mouthed; and little wonder that they did, for we were going like the wind.

It was a full ten minutes before I could steady her. Even then she galloped on full of heart; and when at length I slowed down and ventured to look behind, there was no one to be seen. I had put a good half-hour between me and The Garth. I was far more winded than my horse; and, coming near a cluster of houses, I was fervently glad to dismount and rest, while she stood by with heaving sides. Gradually my breath came back; but I dared not risk waiting too long, and pushed on to a wayside village, where I felt more at ease. There were a number of country-folks on the way to Edinburgh, a few of them with roadster horses. Behind them I rode leisurely, not a soul breaking speech with me. I satisfied the guard at the City Gate without much difficulty, and came back to the 'White Horse' in a considerably more chastened mood than when I left it, thoroughly satisfied that my father's advice not to meddle with other folk's affairs was sound and solid sense.

The good beast had saved my life, and I hastened to see to her comfort. I had good cause to be grateful, for her off ear carries to this day a tiny little hole, the billet of a bullet that was meant for me.

(Continued on page 182.)

EDIBLE ODDS AND ENDS.

EVERY nation has its staple dishes; but the odds and ends are the more interesting, and in their way more indicative of the general status of the civilisation of those partaking of them.

Mankind on the whole has an instinctive dislike to reptiles of every kind and degree; yet of the four families into which the older naturalists divided them—the saurian, ophidian, batrachian, and chelonian—each affords sustenance to man, civilised or savage. So in some parts of the world it is a 'cut from the alligator,' not 'from the joint;' and a darty waiter may bawl his order of 'Boiled snake—one!'

A peculiarly dainty and nourishing dish is made with the iguana, the flesh of which is as white as that of a chicken, and just as palatable; though the appearance of the reptile, with its scaly, black-spotted green coat, is more repulsive than either crocodile or alligator. To the inhabitants of the West Indies and the Bahamas the iguana is a much-valued source of food, and is hunted down by means of dogs, which are muzzled to prevent them using their teeth and damaging the iguanas, which are sold alive, or killed, salted, and barrelled for home consumption. The flesh of the reptile is usually served

up boiled or steamed, together with a dish of clarified iguana fat, sometimes seasoned, into which the very savoury meat is dipped as it is eaten. The eggs of the iguana are also much relished, and are like hens' eggs in taste, but wholly filled with yolk, and do not become hard in boiling. The horned iguana of San Domingo is much appreciated by the *bons vivants* in the West Indies, the flesh tasting just like the roebuck's, though infinitely more delicate.

The common green lizard is eaten with much gusto by many tribes in Africa, and in the south of Portugal the writer has partaken of the gray lizard both baked and fried, the dish in both instances tasting rather like chicken. In Brazil a green-and-yellow snake is consumed by all classes; while among the Sardinians the adder is frequently added to broths and soups.

Crocodile-flesh is publicly sold in the meat-markets of Senaar, in Africa; and in Siam one sees the carcasses hung up for sale like sheep in the butchers' shops. The flesh of this great aquatic lizard tastes somewhat similar to veal, though to the writer it had a faint fishy smell. In South America the cayman, or alligator, affords a dish, when boiled or fried in butter, just as tasty as rabbit. Both crocodile and alligator eggs are much prized by certain nations. The natives of Madagascar are particularly fond of the first, and the Siamese prize the second as a great dainty. In flavour the eggs are said to resemble those of a duck that feeds mostly among the sea garbage of a foreshore, plus a very faint seasoning of musk.

It is the common sea-turtle, though, which has won the highest commendations as an edible reptile. It is a species used in the preparation of the hereditary dish at most of the city banquets throughout England, the supply being sent from Jamaica and the Antilles, the favourite resort of these much-prized reptiles, which travel hundreds of miles in order to deposit their eggs. A single turtle of the Amazon is a heavy load for a strong man; but though much larger than the Caribbean species, it is coarser in flesh. At Ega every house has its turtle-pond, which is stocked for the winter when the Amazon runs low. There are several excellent methods of preparing turtle for the table. The Brazilians cut steaks from the breast and roast them; the lean parts are also roasted; sausages are made of the stomach, and the entrails are used in preparing stock for soup. The usual way is just the simple one of boiling the turtle in its own shell. Newly hatched turtle, with the remains of the yolk still inside it, is particularly dainty and nourishing.

On the Continent the tortoise takes the place of the turtle, especially in the German markets, for which the reptiles are fattened on bread and lettuce-leaves. The mud-tortoise is preferred in Provence and Languedoc, where, as in Italy and

Greece, its blood is drunk, and its eggs and flesh are cooked to satisfy the Lenten hunger of the devout, the tortoise being considered by the clergy as a fish.

Of the batrachians used as food, the frog is the most popular and most historical; the French, Germans, Italians, and Belgians (Walloons) all being noted throughout the centuries for their frog-eating proclivities. The frog is in best condition for the table in the autumn, just before it takes to the water for the winter; but is most popular as food during the spring, for it is then easier to catch. The French usually eat only the hind-quarters, dressed in wine or served with a white sauce, when it is an exceedingly dainty and nourishing dish, finer in flavour than a chick. But the Germans and Walloons, being of a more economical turn of mind, use every part of the animal save its skin and intestines. The species in favour for table purposes is that known as the green frog, though the red frog, much eaten in Italy, is just as good. There is no doubt whatever that the toad is often served in place of the frog in countries where frogs are much used.

But there are many tastes in the dietary of the nations. Bear's flesh is in great demand throughout Germany as one of the most esteemed delicacies, and smoked bear's tongue and hams are much in esteem there. Consequent on their rarity, they are among the most expensive luxuries of the table. From bear liver are made sausages so dear to the stomach of the Teuton; but a very remarkable price has to be paid for them.

Tiger-flesh is eaten in many parts of India, though it is somewhat tough and sinewy. Lion-flesh is very good to eat, and much in favour among the Hottentots and other South African tribes, who are also as fond of rhinoceros as any good Englishman is of a rump-steak. Rhinoceros-flesh tastes rather like something between beef and pork.

But it is elephant's foot which wins most tributes. All who have eaten the baked foot of the elephant agree that it is most emphatically a dish for a king. The flesh of the elephant may resemble, when cooked, nothing more than a compost of soft leather and glue; but the foot! The foot is cut off at the knee-joint, then a hole about three feet deep is dug in the ground, and the sides of it baked hard with burning wood. The embers are removed in time, and the foot is placed in the hole, which is then filled up with earth tightly rammed down. A great fire is built above it, and kept blazing for three hours. At the end of that time the foot is removed, and the casing of hide and earth peeled off. The flesh is now like a jelly, and may be eaten with a spoon. It is certainly one of the greatest delicacies in the world.

If we were hard pushed for a new animal food, it would be a long time before bats were chosen

for a desirable addition to the table; but the French in Tahiti and other islands of that group find the 'flying fox,' a bat measuring some fifteen inches across the wings, an especially edible animal. It is prepared for food by first cutting off the wings, and then passing the body through the fire to remove the fur, and with it the strong foxy smell with which it is impregnated. It is then carefully scraped, split open, and grilled on the embers spatchcock fashion, when it is ready for the table, and is capital eating, having a rich gamy flavour, something between a hare and a woodcock.

That elegant little cuttlefish called the flying squid is also a popular dish among the inhabitants of the South Sea Islands, being served both curried and fried; while a dish of octopus is esteemed a luxury. The cuttle is dried in the sun, cleaned, and scraped, when its outer skin and suckers come off. It is then cut into pieces, tied up in a green banana-leaf, and baked in a quick oven, together with coco-nut milk and a certain amount of the sepia which the octopus exudes. When well prepared, the cuttle, naturally tough and stringy, becomes one of the most delicate and luscious of dishes. Its tripy, stringy-looking substance is converted into a solid meaty food, having a singularly close likeness to lobster

both in flavour and colour, only rather firmer in texture.

But in such dissimilar things as edible odds and ends the most unlooked-for occurrence is often come across. Perhaps among the most singular of these is that connected with the use of the white ant as a food. Eaten in many parts of the East Indies and in various parts of Central and South America, not only by the poor but by the well-to-do, the white ant is prepared in much the same way as obtains in different parts of Africa, where the ant and the wasp form a staple supply of food to the natives. The method of collecting and cooking them is to skim off with calabashes the insects that at time of swarming or migration fall into the water; they are then parched in iron pots over a slow fire, and frequently stirred as in roasting coffee-beans. In this dried state the white ant is looked upon as a most delicious food; and, strangely enough, when pounded and made into a paste, this queer edible has an exceedingly close resemblance, both in flavour and substance, to that very toothsome sweetmeat—marzipan! Burckhardt, the famous traveller, declared that he had never tasted anything so delicious. Such globe-trotters as are daring enough to taste this dish repeat the encomium.

THE DOOM OF THE ZEPPELIN.

CHAPTER II.

WITHIN her impregnable barriers the little fortress island of Heligoland was buzzing with excitement and brass bands. All Highest Majesty had deigned to grace the island with his presence, to hallow and glorify the start of the mighty air fleet designed to cripple the coast defences and complete the wreck of the capital of England.

The scene was well staged. Along the eastern side, from end to end of the island, fifty huge Zeppelins, arrayed in crescent formation, swayed and strained at their earth shackles. Each ship was well equipped with every devilish aid to her holy mission. Guns were mounted fore and aft; a light machine-gun mounted on a platform on the top of the envelope to ward off danger from above; bombs of new and improved design, the latest creations of destructive science; in fact, nothing seemed wanting to ensure success save the blessing of the Emperor, for which they were waiting.

There had been no sleep for the island that night. Through the hours of darkness high-angle guns had followed the sweep of search-lights, and a swarm of 'Taubes' had continually circled round the coast. In the gray of the dawn the garrison had turned out in review order, and the troops were drawn up in glittering ranks within the amphitheatre of airships. The

bands fell silent as the Kaiser, who for an hour had been delivering frenzied speeches, appeared alone on a bastion of the cliff fortress, and stood, a solitary commanding figure, wrapped in a gray cloak, gazing intently eastward.

Not a movement was there in the crowd that waited in strained silence for the signal, all eyes focussed upon their statuesque War Lord. It was a situation dear to Wilhelm's heart.

As the first level rays of the rising sun touched his helmet with fire, he flung aside his cloak, and stood revealed in shimmering blue-and-silver uniform. Twice his sword flashed in the air; the bands broke into the National Anthem, a mighty roar of cheering burst from the crowd, and the vast flotilla rose with slow majesty, hovered a minute overhead, and then moved off with gathering speed toward the west.

Hour after hour the flight of monstrous shapes drove slowly forward against the westerly breeze. There was no hurry. Ample time had been allowed, and there was no sign of the enemy above or below. Petrol was scarce in the land, and the reserve carried might be wanted for a rapid dash homeward when their work was done.

The flagship flew in the centre, and the Admiral had thrown his wings forward on

each side in a wide V formation. He was busy with a map of the English coast, when the telephone-bell from the lookout on the upper gun platform rang sharply.

'Leading starboard ship falling, sir. No enemy in sight,' came the startling message.

Seizing his glass and rushing to the window, he was just in time to see the skeleton of the ship, clothed in a mass of fluttering rags, strike the water and disappear beneath the sea. As there were no hostile craft in view and no guns had been heard, he judged it to be an accident of some sort, and was in the act of ringing for the wireless operator, when again the alarm-bell rang.

This time he did not wait to take the message, and reached the window in time to see the second ship of the line pitch forward and dive, wrapped in a sheet of flame. Even as he looked, the envelope of the third ship swelled out, bursting through the containing ribs, and she fell like a stone.

It was enough. Without waiting for orders, the whole fleet broke line, wheeling and circling like a flock of frightened birds, not knowing which way to turn to avoid the danger, or whence came the death-blows that continued to strike, now here, now there, without sight or sound.

'How's the tally, Charlie? I'm feeling mighty sick. It's a brutal, ghastly business.'

'There's only one more, Jack. You're quite right; it's horrible. Skulking down here in the dark, and picking off the poor devils on a screen when they are five miles away—well, it's like striking a blind cripple from behind. One thing about it—it will never have to be done again.'

X 1 was a beast of a ship, a stinking abomination to live in. Her under-water atmosphere was appalling, as, in addition to the scent of hot engine-oil, petrol, wet clothes, and other subtle essences that pass for breathable air on all submarines, there was more than a suggestion of acid fumes from the accumulators—tightly packed in the space originally designed for her torpedoes—which dried up the throat and made eyes smart and tingle. She was simply a mobile power-station, everything but stability having been sacrificed to that end.

The two men were seated in the control chamber, a small darkened cabin about eight feet square, the walls a mass of switchboards and levers. They were bending over the objective screen that occupied the centre of the room, intently watching a disc of light slowly moving over the concave surface. Through the ceiling immediately above the centre projected the end of the view-finder, a telescope-tube thrust upward to the surface of the water, arranged to swing freely in any direction, a sort of lengthened aërial periscope, focussing the image direct upon

the screen without the use of prisms or mirrors. Rigidly attached to the top of the view-finder, swinging in unison with it, was a parabolic reflector of elwinite, having the concave lens as a central point. The wires from which the destructive current was discharged lay sunk in spiral channels running from the centre to the circumference round the face of the reflector, the curves of the grooves so arranged that all the waves of energy were directed in a parallel beam, following the axis of the telescope.

This cup-shaped object—the only part that appeared above water when in action—being painted a neutral gray green, was practically invisible from above at any distance over a mile.

Slowly Elwin moved the lever that controlled the view-finder until at length into the moving circle of light crept a tiny image of the last unit of Germany's proud air fleet, flying headlong eastward to carry home the news of disaster.

'Stand by to fire, Charlie,' he said, as he gradually worked the diminishing figure of the airship to the point where two fine lines intersected in the centre of the field of vision. 'Fire!'

A hissing flash as the switch came over, a crackling splutter overhead from the projector, and the outline of the last Zeppelin blurred on the screen as her gas-chambers exploded and she fell out of sight.

'The Board of Admiralty have issued the following for publication (Press Bureau):'

'A German air fleet, consisting of fifty Zeppelins coming from the direction of Heligoland, and flying west over the North Sea, has been totally destroyed. We have suffered no casualties. The police authorities have been informed that all regulations restricting the use of bright street-lights, sky-signs, and illuminated advertisements in London may now be withdrawn. (Official).'

So much, and no more, were news-hungry Londoners allowed to know. Edition after edition of the evening papers containing the bare official news, differing only in the sensational wording of their posters, sold like wild-fire. The streets that night were filled with excited crowds, cheering as line after line of electric arcs blazed out, and familiar legends regarding beef-tea, whisky, and soap ran in letters of coloured fire across the darkness of the sky.

In a prison palace across the North Sea, a gaunt and haggard spectre of royalty, driven finally over the borderland of reason, watching and waiting for news that never came, spent his frenzied days of madness urging phantom forces on to victory, mercifully spared the knowledge of his people's anguish and his country's impending doom.

THE END.

A WEEK IN MANDALAY.

By SIMPLEX.

IN the army it is a well-recognised belief that in a military station a death seldom happens singly. There may be no casualty for many weeks; but when the break comes, in the shape of a death, two other deaths may invariably be expected to follow in its wake. Call it superstition if you will, nevertheless it is decidedly remarkable how frequently such a grim sequence happens.

A certain week in the year 1898 is indelibly engraved upon my memory. I was quartered in the fort at Mandalay. The life of the little garrison had been disturbed by nothing untoward for some time. Expeditions after snipe, the daily polo, tennis, and golf, followed by whist, pool, and gossip at the club, made up the day. Except for an occasional field-day, the peace of cantonments had drifted along through one hot day into another still hotter without a break for a monotonous length of days.

Nevertheless, the break—some sort of break—was sure to come at last. So far as I was concerned, it came one morning while I was seated at breakfast in the little wooden mess-house lying beneath the shadow of the great north gate.

A running native ward-boy from the military hospital conveyed a message to the mess butler. A British soldier, having dived into the regimental swimming-bath, had struck his head against another swimmer's body. It sounded nothing. On seeing the injured man, however, I found that his neck was completely broken. One need not enter into pathetic details. Though completely paralysed from his neck downwards, he remained perfectly clear-headed, but his mental agony was pitiful. He struggled on for over four-and-twenty hours; then, to every one's relief, death claimed him.

It was an unusual case. But it was not entirely in the rarity of such a death that comment centred. Death No. 1! Where would fall the other two?

Life in the East is strangely cheap, and death near, as compared with the West. With plague demanding its daily victims amongst the native population at one's doors; with the possibility of cholera, smallpox, &c. almost at every turn; with the suddenness of calamity and the subsequent staggering rapidity of burial within twenty-four hours, the instability of human life becomes rapidly recognised even by those unaccustomed to the East. Looking around a mess-table on the confines of the Empire, one cannot be sure that one of the members of the mess at dinner may not only be dead, but buried, before the dinner-bugle again sounds. I myself received a Christmas card from a brother-officer who had lived with me at Mandalay; but before it reached me

he had been decapitated on the China-Burma frontier.

The answer as to where death No. 2 was to hail from came a few days later. A soldier reported himself sick to me at the hospital, complaining of being unable to breathe properly. He was a fine, strapping fellow, showing, on careful examination, no physical abnormality whatever. He could offer no explanation for the strange catches in the breath. As he answered questions, however, he repeatedly sighed spasmodically. So little could be discovered of his condition that he was half-suspected to be suffering from hysteria. Although hysteria in a healthy-minded soldier is almost non-existent, still its possibility could not be ignored. During the day his spasms of inability to draw his breath properly gradually increased in severity. In the middle of the night he suddenly began to run about the ward, gasping for breath and crying out with fear of impending death. Here again it would be out of place to enter into details. It is sufficient to relate that, by then, his symptoms were easily diagnosed as those of acute hydrophobia. He died before morning.

Next day, his death having given some clue to follow, it was learned from a comrade that both the deceased and he himself had been bitten by a monkey some weeks before, and had forgotten all about it. It was before the days of the Pasteur laboratory at Kasauli. A board of officers was hastily convened to consider the case of the remaining man who had been bitten; and, as was then the usual custom, he was despatched forthwith to the Pasteur Institute in Paris. He left on the day of his late comrade's funeral. What that journey of some four weeks or more—by sea, rail, sea, and rail again—must have meant to a nervous man imagination only can depict. And who would not have suffered from nerves under the circumstances?

One would have thought that, in the ordinary run of things, Mandalay would by then have amply satisfied the Angel of Death in that fateful week, and been permitted to return to peace. Nevertheless, those who cared to think shook their heads. Casualty No. 3 had yet to be faced.

That the pessimists were, unfortunately, correct in their forebodings is interesting, if nothing else. The strangest of all was yet to come.

A brother medical officer and myself were seated at dinner in the army medical mess. The ground floor of the building was used for dining-room and anteroom, and in the upper storey were our sleeping quarters. It was the usual windless, tropical night. The continuous hum of grasshoppers and the croaking of frogs

punctuated the stillness. The breath of heated bricks, emanating from the wall of the fort not fifty yards away, drifted languorously on the scented air. The monotonous swish of the punkah lulled the senses. Coffee and cheroots were at hand. The day's work had apparently ended.

Suddenly the sounds of revolver-shots—a regular fusillade—awoke the fort.

One doesn't shoot flying-foxes with revolvers as a rule. What could it mean? We shrugged our shoulders. That there could be an attack on the fort was an idea which, had it presented itself to us, we should have dismissed with scornful laughter.

We were, however, given little time for idle conjecture, for we had hardly begun to consider the matter when the voice of an excited officer of one of the Burmese regiments, driving a pony-trap, reached us from our compound.

'Come along quickly!' he shouted. 'Dacoits are attacking the fort! There is a soldier and a woman badly wounded.'

To drop the remains of our repast, seize some necessary instruments, and spring into the *tum-tum* was, I need hardly relate, a matter of a very few seconds. We had no weapons. We trusted to our conductor for what protection might be needed.

As the little Burmese pony trotted off at full speed down the straight road toward the opposite end of the fort we asked questions, but were little the wiser from the replies. All seemed confusion. What was exactly happening nobody seemed to know. Also, we at that moment had no time to waste in interrogation. All we knew was that desultory firing, the blare of infantry bugles, and the flicker of unusual lights were disturbing the customary evening calm of cantonments in a most disconcerting manner.

Now the history of the raid upon Mandalay fort by some score or more of dacoits, led by a fanatical *phonjee*, was, doubtless, recorded *in extenso* (with due colouring) in most European newspapers at the time. Such an account, written in cold blood after the actual facts were known and most of the hearsay evidence was deleted, has gone down to futurity. Great events, however, are mostly composite affairs. The component details may be considered unworthy of record by those who merely read. To those who provide the spectacle, however, it is the individual detail, closeted in memory, which makes the story.

In an officer's bungalow we found the woman, a recently bereaved widow of a British soldier, who was awaiting a troopship to take her to England. She was bleeding profusely from sword-cuts on the back and arm, not to mention shock. The shots, therefore, had not been for nothing!

It appeared that the woman had been walking in the cool of the evening with a soldier near

one of the main gates, which opened toward the native town lying outside the fort. They had been set upon by a fierce mob of Burmans, waving *dáhs*, and bent upon wholesale murder. The native sentry was useless to stay the rush. The British soldier—truly a brave man!—held up his unarmed hand to ward off a blow directed at the woman. The next moment his hand, severed at the wrist, lay in the dust of the road.

Handless, he ran to the nearest bungalow, which happened to be the officers' mess of one of the two Burmese regiments quartered in the fort. He had not waited to pick up his dead hand. The woman was down, and he was helpless. He did not think of himself. Holding his bleeding stump aloft, he shouted an alarm to the officers seated at dinner.

'What can I do, sir? Look!'

That there had not been the faintest glimmer of rumour relative to such a possible attack is well known. How such an attack could have happened without news filtering through to the police is not for me to criticise. The officers of this regiment, therefore, were, as can readily be believed, taken completely by surprise. What was happening they had to learn for themselves. What they themselves had escaped by this premature disclosure of the intentions of the dacoits can easily be imagined.

We had all left the club before dinner without a suspicion of the presence of a dacoit within a hundred miles. The sight of the fainting soldier was sufficient to awake his hearers to reality. The officers wasted no time. Running to their bungalows for revolvers, shot-guns, rifles, and what not, they sallied forth. The brown naked bodies of dacoits were boldly advancing in the dark. Then the shooting began.

By the time we medical officers arrived on the scene the wounded soldier had departed in a *dhoolie* for the military hospital. Leaving word with my brother-medico to attend to the woman and convey her to the female hospital, I hastened away after the *dhoolie*.

The hospital veranda presented a bizarre scene twenty minutes later. I was conscious of the weirdness of it even at the time. There was no European medical officer to help me, but that was a matter of no great moment. There was no operating theatre either. A table on the open veranda for the patient, another table for instruments and basins, a lantern held by a native ward-servant, a young Eurasian assistant-surgeon to administer chloroform, and another to do what he might be told comprised my outfit. With the light heart of youth I set to work. The scented tropical night and the giant trees surrounding the hospital provided the atmosphere.

For some minutes there was comparative silence. A distant mumble of voices from the patients overhead passed unnoticed. What was happening in the other parts of the fort I did not know, nor had I time to care. I had an

amputation to do; that alone, for the time, mattered. A scavenging hawk almost above my head flopped noisily from one branch of its tree to another. Except for the small radius of light in the vicinity of the lantern all was in dense shadow. My eyes were busy with my task, but my ears were at their acutest tension.

Presently the sound of a body of marching men, followed by a sharp word of command, resounded through the hospital compound. Next moment the figure of a British colour-sergeant loomed up on the edge of the veranda.

'I have to report to you, sir, for orders,' he stated.

'What orders?' I demanded, looking up over my shoulder as I changed an instrument.

'I have been sent with the hospital guard, sir,' explained the sergeant.

'Good! Well, then, don't let any one in here, that's all. Surround the hospital!' I grunted, bending again to my labours.

'Very good, sir!'

A few further words of command, the grounding of arms, and all was again in apparent peace. The hum of the ever-present grasshoppers and the incessant croaking of bull-frogs continued to sing a lullaby. Now and again a sentry challenged. Otherwise, the recent occurrences since dinner seemed strangely unreal, hardly believable.

My work at the hospital completed for the time, I departed in search of news. Except that no more Europeans had been wounded, I could still learn nothing definite. The officers' mess of the British regiment was almost empty. Most officers were still out on duty somewhere. The gates were all shut. The mounted infantry were patrolling the interior of the fort. How many dacoits there were, or where they were, seemed to be an unanswerable conundrum.

Mandalay fort, it will be remembered, is a mile square, encompassed by crenellated brick walls twenty-six feet in height, the whole being surrounded by a broad moat. In its exact centre stands the gilded old teak-wood palace of the late King Theeabaw, and great wooden gates open from each of the four walls. Round the palace is an inner small moat of no pretensions. The roads inside the fort run straight and parallel, the intervals being occupied by barracks of the native and British troops and the bungalows of the officers. The compounds of the latter are spacious; consequently there is a considerable extent of grass-grown land lying between individual bungalows. Trees there are also in abundance.

It will be easily understood, therefore, that to patrol such an area on a dark night in search of naked brown men who might be crawling about behind any tree or in the long grass, armed with the murderous *dâhs* of the country, was no easy or agreeable task. The following day, when individual facts were known and the routine of the garrison had again resumed its normal aspect,

one felt inclined to smile at the fears and strategy of the previous hours of darkness. At the time, however, it was decidedly not the case that 'ignorance is bliss.' At all events, I for one did not so regard it. To walk from the hospital to the barracks and to the mess seemed a jumpy business, particularly when one was unarmed. The ladies of the station—their husbands away on duty—congregated together, I believe, in certain bungalows, and by no means relished the situation.

The actual attack had soon been thwarted, but not before many shots (well and badly aimed) had been fired. These things I learned before I slept. All the troops were under arms. A mountain battery quartered two miles outside the fort, at Mandalay Hill, was the only unit not concerned in the fray. By midnight the game of hide-and-seek had practically ended. It was known that several of the enemy had been wounded and taken prisoners. Some, climbing the high wall of the fort by the inside ramparts, had dropped to the other side and swum the moat. How many more, however, were still loose in the grass? That was a point that we two who lived in the little mess-house near the north gate wanted to know very much before we could retire, with clear consciences, to sleep.

At last we undressed and donned our usual night attire of silk Shan trousers. My stable-companion, having patched up the wounded woman and amputated a thumb, had become possessed of a revolver. Armed with this, he began restlessly to haunt the top veranda, upon which our bedrooms opened. I was tired, and throwing myself on my charpoy as a temporary measure, drifted into thought. My companion's footsteps, and the knowledge that a loaded revolver stood between us and danger, acted so insidiously upon my senses that I had soon forgotten Mandalay and all contained therein. Why my sentry did not awaken me to take a turn at duty I am afraid I never asked. That he did not do so was evidenced by the fact that it was broad daylight when I awoke.

By noon the next day no vestige of the raid remained. Talk, and the 'swapping of lies,' as the American calls it, now had its innings. The fanatical plot of the dacoits was unfolded in all its childish simplicity. The instigator, an old *phongee*, had collected his followers, and induced them to follow him to glory with the fairy-tale that should they succeed in seating themselves on the disused throne of old Theeabaw the Europeans in the fort would instantly fall down dead, and Mandalay would be Burmese once again. What, except dreamland, could possibly have been responsible for such fiction who can say? The ancient gilded teak-wood throne stood, openly exposed to view or touch, in the cardroom of the club. Burmans daily went to visit it in all openness. Had, indeed, the old *phongee* ventured to place himself upon its dusty seat during the progress of an interesting game

of whist, I am certain that not a soul would have questioned him. There is no doubt that the unfortunate soldier and woman, by their presence at the gate, saved many lives. Had the dacoits reserved their attack until they had invaded the messroom of the British regiment and the officers were seated at dinner, they could have decapitated practically the whole of them with their *dāhs* before the officers were aware of their presence.

Sixteen, I think it was, of the dacoits were hanged in Mandalay jail. One of them, although bandaged as the result of the kindly attentions of a civil surgeon for the treatment of a bullet-wound, naively pleaded an alibi! It provided a touch of humour thoroughly appreciated at the time.

A handsome subscription was collected for the benefit of the wounded woman before she left for England. Not so, however, the wounded soldier. He had, it appeared, been actually

suffering from fever at the time he received his wound. Also, the *dāh* by which he was wounded being by no means clean, he developed erysipelas immediately after his operation.

Walking in the cool of the evening outside the north gate beyond the moat as the great orb of the tropical sun was sinking into the Irrawaddy, I paused, listening. Upon the still evening air came that sound which there is no mistaking. It was the roll of muffled drums!

I had no duty to perform in connection with that last grim note of the week. I had had my share of it. With a profound sigh of relief, I remembered that the death angel had at last been appeased. The third casualty had come and gone. The strains of the 'Dead March' grew fainter and fainter as I hurried away. The echo of the 'last post' reached me as I entered the club by a roundabout way. I wanted a drink, and I got it.

THE SELLER OF PEPPERMINT-WATER.

By the Rev. THOMAS CASSELS.

KING'S KITCHEN lies on the western slope of Scotland, between the moors and the sea, and geographers know it by another name. It is a town with one main street, which bunches out about the middle into a labyrinth of smaller streets, like ribbon tied into a true lovers' knot with trailing ends. Quite a happy, smiling place is King's Kitchen. It is a little gossipy perhaps, but it is quite good-natured; and the green fields are so near that throughout the length of the town, and even in the little streets at the knot, the women in their kitchens can hear the larks singing on an April morning.

Here, as in all such Scottish towns, may be seen the passing of a civilisation. Most of the old people, and even many of those in middle life, retain the manners and characteristics of their forefathers. They are sarcastic, old-fashioned, thrifty, and friendly; and they use the soft, caressing speech of long ago—the auld Scots tongue, for which Burns and Scott won a high place among the languages of literature, and whose words have so often a chuckle in them, as if they had been born in the hour of a great jest. Lovable folk are these; but, alas! they are a diminishing band. The new generation has been educated at Board schools by teachers who talk English jumping with Scotticisms. The old ruggedness has been planed down. Clever they are in their way, these new young people; but the pawkiness and the couthiness have disappeared. The words that chuckle, the metaphor that leaps and laughs, have gone from their lips. Burns would not know them for Ayrshire folk if he arose from the dead. They are commonplace.

But the future belongs to them. A few years, and the old uncouth Scots civilisation, with its

frolic and thrift and quaintness, will have disappeared; and so it becomes almost a public duty to try to limn it ere the model has left the atelier. And when I think of these men and women whom I knew, with their dying crafts, their superstitions and strange adventures, it is not long ere my thoughts come round to old Mungie Campbell, the seller of peppermint-water.

Mungie lived in a tiny thatched cottage situated towards the eastern end of King's Kitchen. It had only one room, low-ceiled and cosy, with two windows, one of which looked out on the long street, and the other, half-covered by a white rose-bush, on the garden behind. A pretty little interior it was, with a tall eighteenth-century clock in one corner, and in another a rack of old earthenware that some collectors would fain have known about. But what the cottage lacked in size the garden behind made up. It ran right down to the river—a long strip of sunlit ground, and here was grown the peppermint from which Mungie's wife brewed the famous peppermint-water. She did it twice a week during the months of greenness, locking the door and blinding the windows, for the operations were secret, and the recipe was the heirloom of her own family. The neighbours naturally resented this secrecy, and many were the attempts to outwit her; but she foiled them all, and they were left guessing. They said, indeed, that when she brought out her little still Mungie himself had to go elsewhere; which I believe was quite true, though not, as the neighbours unkindly said, because the secret was kept from him, but because a man is apt to get in a woman's way when she has something serious on hand.

At any rate, there was no question of the excellence of the peppermint-water in public opinion. There were scores of people in King's Kitchen and the parishes round about who would not trust themselves to sleep at night without having first a thimbleful of Mungie's peppermint-water, as a charm against the imps of colic and toothache which are abroad in the darkness. It was no unusual thing for him and his wife to be wakened at midnight for some peppermint-water to be administered to a wailing baby; for, though dill-water could be purchased in the shops, there was a smack and a potency about Mungie's peppermint-water that commanded public respect.

Mungie himself peddled the water over the countryside, carrying it in two little kegs slung over his shoulders. He had his regular customers, whom he visited at intervals, and some of these visits required leagues of travel. He announced his approach to any abode of man, be it farmhouse or bothy, with a kind of chant, lauding the properties of his famous distillation:

Gude for colic,
Gude for wun',
Gude for big folk,
Gude for weana.

The man was interesting. His father was a clansman of Argyll, who had come from his native glen, not long after Waterloo was fought, to help to make the industrial prosperity of the West of Scotland. He had married an Ayrshire girl, and Mungie was the seventh son. From his Lowland mother he had inherited the pawkiness, the fun, and the grit. From his father had come a few words of Gaelic, a high temper, and a touch of the second-sight.

With such a mental make-up, many were the adventures of his spirit as he footed it to some outlying farmhouse. He had strange thoughts, and sometimes saw strange sights on the wide and solitary moors that lie behind King's Kitchen. For it is a land remote. People live there almost within sight of the smoke of Glasgow, yet knowing almost nothing of the movements of the world; for, though there is a weekly newspaper, the farmer would fall asleep as he began to read it. To these places Mungie came as full of news as a post-bag and as welcome as the flowers in May. When the familiar figure was spied by the farmer at his plough, he would leave it in the furrow with the waiting team, and come over to chat with Mungie.

These things I learned soon after I came to King's Kitchen; but it was a month or two before I heard the war-cry raised one night outside my window, and knew that Mungie had come to claim me as a customer. He stalked in, a tall, gaunt man, the kegs on his shoulders. With an easy swing he deposited them on the floor, and, after shaking hands with me in a wordless way, produced from his pocket a cloth. Wrapped up in it was a small metal cup, which he carefully

wiped. Lifting one keg, he shook it, with his head to one side listening. Then he resorted to the other keg. Tilting it up, he filled the cup about half, and handed it to me. 'Ha'e,' he said. 'Gude for colic, gude for wun', gude for big folk, gude for weana.' Very cautiously, as a man trying the unknown, I did as I was told. It tasted of forgotten things. Surely, sometime long ago, in babydom, when I cried in the night, my mother had given me something that tasted just like that.

'It warms ye,' said Mungie; 'feel how it warms ye—away doon.' And he indicated the probable course of the fluid with a gesture.

I thanked him and expressed my appreciation of the warming properties of his merchandise, and was going on to say that I would take some, once a year or so, when he stopped me. 'I'm no' after business the nicht,' he said. 'I'll come back again. I cam' up because I needed the advice o' an inkycot.'

And with a rush the story came. He had been up that day at the Lampits, which is a small farm lying away in the moor. A few acres of arable land—a green patch amid the brown—explain why a human habitation is there. Around it are bogs and torrents, and an eighteenth-century traveller has told us how dangerous he found them. In days of unsettlement the Lampits was a refuge and fortress better defended by its morasses than by cannon. A strange place it is, with thrilling histories clinging to it; a place of tragedies, a house of fear, a farmhouse on the frontiers of the occult.

A long and solitary way, engineered by a past generation over the morasses, is its only approach. About a quarter of a mile from the Lampits there is a loop in the road, where an inundation once necessitated the making of another line. After a while the water had subsided upon some movement of the bog, and foot-passengers generally use the shorter road—the old road—but the farm-carts and the horsemen have to go round the loop. The two roads are within a hundred and fifty yards of each other.

That day Mungie Campbell was due at the Lampits, for he visited it every three months or so. It was November, and the fog lay on the moor, blotting out the landscape with its wetness, and making all things indistinct. There was no wind, and the silence was broken only by the gurgle of the water in the bog. When he reached the loop he took, as was his wont, the shorter lower road, picking his steps with care. About half-way over he glanced toward the other road, and stopped astonished, for he saw coming from the direction of the Lampits a funeral procession. There was the King's Kitchen hearse, grim and unmistakable, with a dozen mourners walking behind, followed by conveyances to take them up at a decent distance from the house, for it was a long way to the churchyard at King's

Kitchen. Mungie recognised the mourners and the drivers, all save one, of whom he was not sure until he recollected him as the new man who had just come to town—namely, myself.

'I was vexed, vexed,' said Mungie, as he told me the story. 'I saw the coffin'—the King's Kitchen hearse has glass panels; 'it was a wee white ane; an' I said to masel', "Puir wee Danny! puir wee boy!" for Danny is the laddie at the Lampits, an' him an' me are chief. An' I thocht it queer that I hadna heard; but of coorse it's a far cry frae hereabout to thereabout.'

In after days, when I came to know Mungie well, I knew with how sad a heart he would go on to the house. Childless himself, he was the friend of children, to whom his kegs suggested smuggling days and high romance, and who besought him for a taste of his peppermint-water. But when he came to the Lampits with sad face, out of the byre ran Danny himself bright as a bee, and just home from his three-mile trudge from school; and after him came his mother with her milking-pail in her hand, and laughing with pleasure to see Mungie. 'Come awa' in, Mungie,' she said, leading the way to the kitchen. 'I'll gi' ye tea, an' ye'll gi' me peppermint-water.'

'Noo,' said Mungie to me when he had told me all this, 'I sat there in the Lampits kitchen an' thocht o' what I had seen, an' asked masel' ower an' ower, "Will I tell her?" I said to masel', "Better that she shouldna ken. It may be years awa'; an' then anon I said, "It wud gi' her time for a wee bit lovin' an' a wee bit pettin' afore she loses him." I didna ken what to dae, an' they thocht me queer—no masel' at a'. Weel, I was to bide at the Lampits the nicht, an' come to King's Kitchen in the mornin', but I couldna bide. I cam' hame through the daurk; an', seein' ma ain minister wasna at hame, I thocht I wud ask you what ye thocht. The question to be settled is, will I gang back an' tell her?'

I smiled to myself at the simplicity of the man, and gave my advice with a light and confident heart. 'You did well not to tell her,' I said. 'There is nothing to go upon but what you thought you saw in the fog. It may have been a farm cart with a load of peats—or—or nothing at all.'

Mungie rose, picked up his kegs from the floor, swung them over his shoulder, and tightened the buckle of the belt that carried them. 'I doot,' he said quite solemnly—'I doot ye dinna grasp the seriousness o' the situation.'

But I think I did grasp it four days later, when I was summoned to the funeral of wee Danny at the Lampits, for the custom then was at King's Kitchen to give a general invitation throughout the town. In a case like this of the dead being brought from some distance, the townsfolk who were able to be present waited at

the town-end the approach of the sad procession. But this sequel to Mungie's story had startled me, and I made arrangements to go the whole journey. I had my own trap, and on my way out of the town I drew up at Mungie's door and offered him a lift up.

He came out to the kerbstone. 'I'm vexed, vexed I didna tell her,' he said 'That was what they sent it for.'

'They?' I asked.

'Ay, they—they sent it for her to be telled, an' I didna tell her, unfaithfu' servant that I am.'

I asked him to come up with me.

'Na, na,' he said, 'no' a fit. I wudna gae near the Lampits the day, no' for a' the gold in the world; me an unfaithfu' messenger.'

I began to see how little I understood of the Scots character.

I arrived a little late at the Lampits. The procession was just starting; but I had a glimpse of the mother rocking herself on her low stool in the kitchen, and saying again and again, 'If I just had kenned! If I just had kenned!' The boy, I was told, had climbed up on the roof of an outhouse, and, falling off, had struck his head on the edge of a grindstone lying beneath. He had never regained consciousness, and the grief of the mother was edged by the remembrance that she had been so much displeased with him that morning that she was not speaking to him. She was a woman of that kind, and no punishment, she had discovered, was more severely felt by the little boy than her silence. On that day he had pursued her awhile as she went about her work in the farmyard with his pathetic cry, 'Speak to me, mother! Speak to me, mother!' and then, heartsore at receiving no answer, had essayed the desperate adventure for his sma' feet of climbing on the roof. 'If I just had kenned!' she said again and again. I was glad Mungie was not there to hear.

When we started on our long journey to King's Kitchen I walked among the mourners, whilst some other man took my place on the driver's seat. The day was dull and cold. A Scotch mist filled the moor and blotted out the road behind us and in front at a little distance. It was my first visit there, and I was struck with the silence. Save for a low murmur of talk, that sounded almost sinister in these surroundings, and the muffled noise of the horses, the place seemed deserted; not even a bird called across the morasses. In two hundred paces or so the farm was indistinct behind us; a little farther and it had disappeared, the mist closing round it. A few minutes' walking brought us to the loop. We took the road to the right, the longer higher road that horses followed. It was with interest that I looked over toward the lower road, remembering Mungie's story. The line of it was visible through the mist; a difficult, dangerous road, beset with moss-hags, it

appeared to me as I looked down on it. Then I saw a man coming along it—a tall figure creeping out of the mist. 'My God,' I whispered to myself, 'it's Mungie!' There was no mistaking him. He came striding along with his kegs slung over his shoulders and his eyes set on the ground, picking his way carefully, as any traveller on that road would do. So absorbed was he that we were almost abreast of him before he saw us. Then he looked over and stopped.

I found myself shivering as if an icy wind were searching me. My teeth chattered, and it was all I could do to keep step with the rest. I felt as if I had stumbled on some secret and dreadful thing, some strange deformity of nature. The figure stood looking at us for a moment or two, and then, with a sad little gesture, let the kegs slip off his shoulders to the ground. Then he took off his cap, and I saw him pass his hand across his eyes.

Slowly the mist swallowed us up, but the last I saw of the mysterious traveller on the other road was his still gazing after us with uncovered head.

When we drove into King's Kitchen a little group of the town's-people joined us for the slow walk through the long street; and among them, decently dressed in black, came Mungie, who, they assured me, had waited with the others, and had not been out of the town that day.

Shadows though we are, is it possible that we cast shadows somewhere, on some unknown screen; and was there some strange displacement of shadow and substance in the fog at the Lampits? I do not care to say. But certainly, in Scots villages at least, such adventures come, though now they come not to the young folk but to the old—the people of the dying civilisation, like Mungie Campbell, the seller of peppermint-water.

THE LONDON OF THACKERAY'S NOVELS.

By E. BERESFORD CHANCELLOR.

THACKERAY was pre-eminently a Londoner.

Indeed, it might be confidently argued that he was more a Londoner than Dickens; for his whole life was practically passed in 'the Wen,' as Cobbett termed it; and, unlike his great contemporary, he was never drawn away from its attractions by the charm of a country existence. Most of our great novelists have, of course, dealt with the city in their works, more or less fully—from Fielding and Richardson, Fanny Burney and Jane Austen, down to Meredith, who has left us an unforgettable picture of London Bridge and a vivid description of a London 'particular,' and Gissing and Mr Morrison and Mr Whiteing, who have reproduced the very atmosphere of those mean streets which reveal in themselves so much of London's complex life. But in this particular phase of what, for want of a better name, may be called 'romantic topography' Dickens stands easily first. For just as he re-created Christmas, so he may be said to have rediscovered London; and the London he found—the London, that is, of the first half of the nineteenth century—is exactly the London in which his great contemporary was discovering homes for his characters.

The aims of the two writers may, to some extent, I think, be judged from the *milieus* they selected for the men and women of their inimitable fancy. Dickens seldom comes west of Temple Bar; Thackeray not often goes east of it. They meet on the mutual ground of the Temple, and occasionally make incursions into each other's territory—as when we find Mr Merdle in Harley Street and 'Cousin' Feenix in Brook Street, or

Mr Bungay in Paternoster Row and Pen and Clive in the Charterhouse. But, to lay down a rule which has its frequent exceptions, it is the West End that Thackeray affects; it is the mysterious East which Dickens has made an almost open book to the dwellers in the realms of fashion.

Somehow or other, however, Thackeray has never quite been regarded as an exponent of London in the same way as has Dickens. A whole library attests the interest which Boz has awakened in the subject; but only once, so far as I know, has any one compiled a book on the London of Thackeray's novels, and this was, characteristically, produced by an American nearly a quarter of a century ago. And yet what a field is here for exploration; how much information about the London of the early nineteenth century is forthcoming from a study of the great novels and the shorter stories and sketches! Here I can but adumbrate the subject—merely name (so to speak) the chief peaks in its mountainous ranges.

Let us take *Vanity Fair* first. It is the London of the Regency that is presented to us; before Regent Street had come into existence; while yet Waterloo Bridge was in the making; before the old Houses of Parliament had given place to Barry's great medieval pile; when the Turnpike yet existed at Hyde Park Corner, and the Lock Hospital still stood in Grosvenor Place. Buckingham Palace was yet the red-brick picturesque structure which George the Third had bought for Queen Charlotte, and the Ranger's Lodge (the stags from whose entrance now adorn Albert Gate) stood in the Green Park

opposite Down Street. Russell Square had not long been formed, so that the Sedleys and Osbornes, who lived there, must have been some of its earliest inhabitants. The Square was much frequented by the legal profession, and Amelia may have known Sir Samuel Romilly, and perhaps Lord Denman (both residents), by sight, and no doubt wondered at the crowds of fashionable people who drove up to No. 65, where Sir Thomas Lawrence was engaged in perpetuating the lineaments of his generation. Russell Square bulks largely in the first part of *Vanity Fair*; it is the arena wherein the *dramatis personæ* chiefly disport themselves. But we can go elsewhere in their goodly company—to Vauxhall, for instance, when Jos, under the influence of the rack-punch, made such an exhibition of himself, and when 'the hundred thousand *extra* lamps' lighted up the gentle countenance of Amelia and the green eyes of Becky, the complacent features of George, and the homely 'phiz' of Dobbin.

The Great Gaunt Street where Sir Pitt Crawley's family mansion was situated was, I surmise, either Harley Street or Wigmore Street, and I have no doubt whatever that Lord Steyne's palace, Gaunt House, was the Harcourt House, Cavendish Square, demolished some years ago in favour of a vast block of flats. It has been stated that both Lansdowne House and Manchester House were the prototypes of the mansion where Becky distinguished herself on a memorable occasion; but any one who reads carefully Thackeray's description will not, I think, be likely to concur in this view.

One cannot always be sure of identifying Thackeray's houses, however; otherwise one would be able to say which was Miss Crawley's residence in Park Lane, or walk unerringly to the miserable Raggles's snug little house in Curzon Street, where the Rawdon Crawleys lived on nothing a year. Where, one would like to know, was the 'wonderful small cottage,' in a street leading from the Fulham Road, to which the ruined Sedleys retired; and where the chapel, down Brompton way, in which George and Amelia were made one? By the bye, Thackeray is careful to tell us that when George drove to that rendezvous from the old Hummums in Covent Garden, the carriage passed Apsley House and St George's Hospital, 'which still wore red jackets'—the original red brick not yet having been encased.

Bay's Club—no doubt standing for White's—links us on to *Pendennis*; for out of the famous bay-window of that place where Wenham interviewed Rawdon Crawley after the duel with Lord Steyne, the redoubtable Major was accustomed to gaze in company with his cronies. The Major's lodgings were conveniently near, in Bury Street, where, at that period, he must have had Tom Moore as a neighbour. His nephew, the hero of the story, had been educated at the

Grey Friars (Thackeray's name for his own old school, the Charterhouse), and the descriptions of that seminary here and in *The Newcomes*, and elsewhere, are unusually elaborate and *documentées*. Foker, it will be remembered, was also educated here—Foker, the rich and worldly, whose parents lived in Grosvenor Square and drew their wealth from the family brewery.

But it is the Temple in which most of the action of *Pendennis* takes place, where we find Pen, under the *ægis* of Warrington, working hard at journalism, and frequenting those haunts on which his fashionable friends rallied him, but which gave him the materials for his first literary success. During this period of his career Pen was holding out one hand to the West End (his uncle saw to that), and was stretching forth the other to the coal-heaving company at the 'Fox under the Hill' and the denizens of the 'Back Kitchen.' Like Warrington, however, he undoubtedly preferred, at this time, 'a sanded floor in Carnaby Market to a chalked one in Mayfair.' The Embankment chased the 'Fox under the Hill,' familiar to readers of *David Copperfield*, out of its existence near the Adelphi Terrace. The 'Back Kitchen' was Thackeray's name for the 'Cider Cellars' in Maiden Lane, which stood next door to the Adelphi Theatre, and was once the haunt of the classic but bibulous Porson. It was hither that Colonel Newcome brought Clive on a momentous occasion.

In those days the Fleet Prison was in existence, and we visit it with Pen and Warrington to see Captain Shandon, a prisoner for debt in that degrading abode, who was producing for Bungay the prospectus of the *Pall Mall Gazette* amid his grimy and squalid surroundings. The spirited proprietor of that journal, Finucane, occupied chambers in the Temple, it will be remembered, and frequented Dick's Coffee-House, formerly known as 'Richard's,' which occupied the site of 8 Fleet Street till its demolition in 1899. The offices of the *Pall Mall* were in Catherine Street hard by. Closer still to the Temple was that Shepherd's Inn, near Holywell Street and Wych Street (where are they now?), where Altamont and the Chevalier Strong lodged, and Costigan, and whither Pen was drawn by the charms of Fanny Bolton. Shepherd's Inn was but another name for Lyons Inn, where Mr Thurtell—whom Weare murdered—had rooms.

As in *Pendennis*, so in *The Newcomes* do the Charterhouse and the Temple bulk largely. We begin the book with the famous school, and end with it—in a passage notable among the great word-pictures of literature. But we are carried about London in all directions outside these academic centres. Bloomsbury Square is the headquarters of one branch of the Newcome family; Hobson Newcome lives in Bryanstone Square, and John Giles, his brother-in-law, in

Bernard Street, Russell Square; Sir Brian conducts his stately affairs in Park Lane. A subsidiary character, Lady Budge, dispensed 'the most elegant hospitality,' according to Charles Honeyman, at her mansion in Connaught Terrace. Where the Reverend Charles himself lived is not so clear. Thackeray says he had rooms in Walpole Street, in the Mayfair district. This may stand for Market Street at the back of Curzon Street, where Lady Whittlesea's chapel, otherwise Curzon Chapel, notorious for the doings of the Rev. Alexander Keith, was situated.

The hotel patronised by Colonel Newcome—Nerot's—was in Clifford Street, and was probably identical with the Clifford Street Coffee-House once standing at the corner of Bond Street, and notable for its Debating Club, where the budding eloquence of Mackintosh and Canning was first heard. The Colonel's later and more permanent residence was a large, rather gloomy house in Fitzroy Square, which he took in conjunction with his friend Binnie, and where the latter's sister came to keep house and rule with a rod of iron. This quarter was then, and for years after, an artistic centre—Eastlake and Ross and David Roberts all lived at one time in Fitzroy Square, and this no doubt influenced the Colonel in his choice of a residence; for his son, as we all know, was destined to be a great painter. After his father's return to India, Clive took lodgings in Charlotte Street hard by, where Richard Wilson and Constable, Farington and Westall, had all lived. Indeed, Constable must have been there at this very time, for he occupied Farington's old house, No. 35, from 1822 till his death in 1837.

Other localities in *The Newcomes* which we can identify are Jermyn Street, where Florac lodged and Pendennis lived; Belgrave Square, whither Barnes Newcome went after his accession to the baronetcy; Queen Square, Westminster, now Queen Anne's Gate, where Pendennis abode later, and also where he was domiciled when we meet him in *Philip*.

In this book we are in many of the same quarters as we were in its predecessors—the Greyfriars and the Temple, Mayfair, Bloomsbury, &c. But where was Ringwood House? (There is a Ringwood House at Walthamstow.) Thornough Street, where the 'Little Sister' lived, must have been near Fitzroy Square. But can it be traced? You may pore over a map of that mighty organism which we call London, and despair will catch hold of you when you attempt to unravel from its complicated web some skein which shall lead you to a solution. The Twisdens, we know, lived in Beaunash Street; and from what we learn of that family, we feel certain that their abode was in a fashionable quarter, but I defy any one to put his finger on the thoroughfare. Who, too, will identify the clubs mentioned in the *Book of Snobs*? We can put names to the Martium and the Viatorium, the Reformatorium and the Ultratorium,

which greet us in the *Roundabout Papers*; but which was, or is, the Megatherium; which the Palladium?

The Berkeley Square of *The Fatal Boots* is not clearer to us than the Buckley Square of Jeames's Diary; the Scarlot Street of Cox's Diary is as plain as the Charlotte Street where Pendennis lodged. But Thackeray, like Dickens, used to the full the novelist's privilege of mixing up his localities—of, here, giving them their correct names; there, hiding their identities under more or less thin disguises. When he was purely historical, as in *Esmond* and *The Virginians*, there was no need for fictitious appellations, and Lady Castlewood can live in Kensington Square and Bolingbroke in Golden Square; duels can be fought (as they were fought) in Leicester Fields, and Mohun and Hamilton can go to their last fatal meeting in Hyde Park. But there were sometimes reasons, no doubt, when a more contemporaneous narrative was in hand, for using just sufficient mystification to obviate the chance of wounding the susceptibilities of the denizens of a particular street. Even were this the reason for some of Thackeray's careful covering up of topographical traces, the fact still remains that the memory of the Rawdon Crawleys will remain as long as Curzon Street exists, and Baker Street will hardly outlive the dreary character which the novelist has bestowed on it.

Those who know their Thackeray will perceive how slightly I have been able to touch on this fascinating subject. Nothing short of a book can do justice to it; and when I have completed the volume in which I want to deal with the London topography of Thackeray's novels, I hope I may be able to make clear some of the mysterious identities which have puzzled me and, perhaps, others.

OLD SONGS AND STORIES.

WHEN books were rare, and leisure long,
And human cares were passive,
The world had time to learn a song,
Or loiter months and months among
Old folios tall and massive.

Great books were not great evils then,
Nor fact so dear as fiction;
The age was more romantic when
No critic yet o'ersat the pen,
Which ran without restriction.

Hence grew the grace of balladry,
Like flowering broom on Couden;
And, plumed and mounted, fair to see,
Beauty and Chivalry rode free
Through many a chapter golden.

Now wealth and greed our hearts estrange
From all those pleasing fancies;
So knights no more the woodlands range.
Ah me! it is a woeful change
From ballads and romances.

J. LOGIE ROBERTSON.

Chambers's Journal

SEVENTH SERIES

THE LONG PORTAGE.

By H. MORTIMER BATTEN.

CHAPTER I.

EDWARD FIELD, the pilot, mail-carrier, and general portage agent at Whitewater Rapids, scrutinised, with the eye of a horse-dealer about to make a purchase, the straddle-legged moose calf.

'There isn't enough meat on him to feed a chipmunk,' was his final decision; at which the squint of the Indian who had brought the moose from the woods became more pronounced.

'Him heap young. Him put on fat pretty blame quick you feed him up.'

The Indian, dressed in the garments of civilisation four sizes too large for him, wore huge gold-rimmed glasses and a sun-hat minus the brim. He held the moose by a twisted willow-wand looped round the animal's head midway between the eyes and nostrils. The calf, with an air of drowsy indifference, stood with forelegs wide apart, and at intervals waved its great ears with casual inquiry.

'I'm no connoisseur in moose-meat,' the pilot stated. 'And, anyway, I don't want the blame thing.' And Mr Field turned on his heels.

'You give me pair of moccasins, one pound tobacco, I give you blinking good calf. Fair trade.'

Just then the door of the bungalow away up the clearing opened, and the pilot's daughter came out. Evie Field stared in astonishment at the moose, then called to some one inside the house, 'I say, Tim—Mr Potts—just you come and look here.'

Evie Field, a pretty, joyous, pink little creature, ran down the clearing, followed by Tim Shields, a fair-haired English boy, and Potts the clerk. Top-Hat John, a Cree Indian youth from the mission station, came a bad fourth.

'Where did you get him from?' the girl inquired, addressing the Indian.

'Shot the mother away up Coyote Pass way,' Mr Field explained. 'The calf, feeling kind of lonesome, followed them out; so Marcus brought him along.'

'One pair moccasins, one pound tobacco, blinking good'—

'I'll give you ten dollars for him,' Evie offered promptly.

The Indian shook his head. 'Want tobacco, moccasins,' he stated sullenly.

'You can buy them at the store for ten

dollars, you copper-coloured pagan!' Tim informed him.

'Give him his money and let him be going,' suggested Potts. 'Then we'll have moose-meat to keep us till Christmas.'

'I like your style, Potts,' observed Evie, producing a wad of bills. 'This isn't a philanthropic meat trust, anyway.'

The exchange was made, and Evie, with an air of possession, took charge of the halter.

'What do you reckon you're going to do with him, Evie?' inquired Tim Shields.

'You wait till the freeze-up comes along, then you'll see.'

Mr Field regarded his daughter narrowly. 'I don't hold with pet wild animals,' he stated gruffly. 'They're all right when they're small, but when they grow up one doesn't like parting with them.'

Tim took the halter, and, throwing it over his shoulder, tugged the reluctant young moose up the clearing, Top-Hat John—so named on account of his partiality for an old top-hat presented to him as a parting gift by one of the mission station Sisters—falling in behind and pushing.

'They use reindeer in Norway for pulling sledges,' Evie answered. 'Why shouldn't we use moose in Canada?'

'Because it don't work, girl, or we should have used them years back. If that's your idea, I tell you right now you're shinning up the wrong tree.'

Evie took her father's arm, and there was little doubt they had come to an understanding when they reached the veranda.

The young moose was bedded down in the stable, and given a hot feed of bran, which it ignored.

'It wants green stuff,' said Tim. 'You'll have to lead it about a day or two till it gets to know the place; then it can run loose.'

During the days that followed the moose calf occupied all the spare moments of the young people at Whitewater Rapids. Fall was settling into winter, and the white mists that hung about the clearing each morning till the sun was up already held a flavour of frost. Top-Hat John, the Indian boy, was despatched by canoe to Kilween to purchase a leather collar and cow-

bell; and, thus adorned, the young moose was given free run of its forest home. Potts, who was a moderate amateur joiner, was put into commission; and, by the liberal use of strips of hardwood, screws, and green paint, he managed to convert an old basket dog-sled, rescued from under the bungalow, into a moose-sledge so smart that even Evie complimented him; at which the clerk almost collapsed with surprise. Top-Hat John made the harness, adorning it neatly with porcupine-quills and coloured beads.

In the meantime the young moose had attached itself permanently to the camp, and from dawn to sunset the *tink-tonk* of its bell sounded about the clearing, never more than fifty yards distant. At meal-times it haunted the veranda, and once or twice strolled into the house with its usual air of nonchalance, to be unceremoniously driven out by Potts and Mr Field. It was fed on bread and potatoes, or any other such delicacy that happened to be left over; and when the meal was finished it would return to the forest-edge, straddle down a young birch or poplar, and browse on the topmost branches.

Under a varied and abundant diet the young moose grew at an alarming rate from the day of its arrival, while its lapdog disposition became somewhat embarrassing to its owners. It was happiest when allowed to walk in some one's footsteps, its great muzzle resting wearily on its companion's shoulder; and if left behind it would utter a weird little chirruping squeal, obviously absurd for so large an animal.

One day the calf happened to be following Potts in this manner while the latter was searching the clearing for firewood to save himself the trouble of cutting a fresh supply. Potts was essentially a city man, and even in the matter of clothing he seemed out of place in the woods. Why he remained at so isolated a place as Whitewater Rapids many had wondered, and indeed the only explanation seemed that—well, no matter. Evie was a remarkably pretty girl, and had a free and taking way with her which most men who visited the portage found vastly pleasing.

Potts was wandering about the clearing, the moose at his heels, when suddenly the young animal, feeling itself ignored, seized one of the man's black locks in its teeth and gave a yank that threatened to draw the wisp out by the roots. It happened that Tim glanced from the bungalow window at that moment, and saw the clerk strike the moose savagely across the face with the shaft of the axe he was carrying. The creature gave a scream, and dashed into the forest; while Potts, after a hasty glance to convince himself that he was not observed, hurried into the little wooden hut he occupied as an office.

For some time that evening Moosewa defied capture, and when finally Evie succeeded in laying hands on it she called to Tim, 'It has damaged one of its eyes. Must have rammed a branch

into it, or something. It looks bad, anyway;' and she pointed to the injury.

Tim glanced at Potts, but the pale face of the city clerk was turned away, and he said nothing. It was such little deceits as this that had enabled Tim to weigh up his companion since they had become cabin mates.

In spite of the girl's careful nursing, the damaged eye refused to get better, and finally became permanently closed. The moose was blind on one side for life.

'Mighty inconvenient for it,' observed the city clerk with a laugh. 'But I don't fancy it will spoil it any for driving.'

'Not until it begins to foul the timber on its blind side,' observed Tim dryly.

Tim and Potts lived together in the spacious cabin on the opposite side of the clearing from the bungalow. The clerk had appeared upon the scene that summer, and thrown in his lot with Tim, who had lived at Whitewater a matter of three years. They were men of vastly different types, and Tim found the southerner's wonderful stories of his own adventures tiring in the extreme. He tolerated Potts just as he had learnt to tolerate the fly plague and other objectionable features of his pioneer existence. Mr Field had taken Tim into his charge with fatherly affection, and now the boy was more like a son of the house than a hired man. He had proved himself as hard a traveller as he was trustworthy, and an exceptional dog-driver. There were rumours to the effect that he would shortly be given a share in the business, and that he would carry it on after the old man's retirement.

Winter came slowly that year. The moose was better again, the sledge and harness were ready for the ice, and Evie chafed under the long delay. But at length a flutter of snow fell, followed by a tense stillness. Next morning the rim ice had formed along the creek-borders, while the central race moved with that oily sluggishness that precedes a quick freeze-up. When darkness fell again the river was sealed from bank to bank in the silent grip of winter.

The breaking of Moosewa to harness proved a disgustingly tame affair. Tim, Evie, and Top-Hat John had conjured up in their minds pictures of pacing mustangs and bucking broncos, and had imagined a snorting, red-eyed moose careering panic-stricken across the ice, till finally their gentle persuasions brought the animal round to their way of thinking.

The whole household assembled upon the flat to see the show. The harness was donned, Tim took his place in the sledge, and at a word the moose was given its liberty. For the space of a minute the animal stood stock-still, amidst roars of laughter from the assembly; then suddenly the thought occurred to it that the touch of the harness was irritating, and forthwith the moose proceeded to eat it.

'Mush! Hi, mush on, there!' shouted Tim.

The driving-switch was called into operation, and with a playful squeal the moose turned, scattered the group, and proceeded to amble leisurely toward home. But the breaking-in process was continued till the steed intimated its opinion of such a pastime by sitting down in its tracks with a good-natured grunt.

'I tell you, Evie, it'll be no end of a success,' said Tim with the enthusiasm of a schoolboy. 'It's beginning to learn already what the tugs at the halter mean, and it can go like the wind.'

Evie and Tim had now a common interest which brought them regularly into each other's company. On moonlight evenings they spent many an hour together on the flat above the rapids, and it is to be thought that the moose was not the sole item of interest they found there. When opportunity occurred Potts obtruded his presence upon them; but for the most part the clerk was busy with his books till long after the fall of darkness.

Soon Tim began to realise that the feelings he entertained toward his cabin mate were becoming mutual between them. The man's suave manner was assumed to hide a soulful jealousy; and, knowing more about Potts than he cared to tell, Tim realised that the disguise with which each of them concealed his feelings would sooner or later be uplifted. The constant petty meanness of the city clerk, his habitual evasion of physical exertion, began to irritate the young Englishman more and more, and many a night, on returning weary from the trails, Tim was on the point of settling Potts once and for all.

Ere the first month of snow was past the young moose had thoroughly learnt its lessons, and soon proved a great success as a draught animal. It was faster than the best dog-team on the river, while its great snowshoes prevented it from sinking where a horse would have floundered helplessly.

One day Tim drove the outfit to Kilween City, despatched the down-river mails, and arrived back at Whitewater, beating the previous record by one hour and seven minutes. After this the fame of the moose-sledge spread far and wide. Bearded traders from the Hudson Bay outposts, prospectors, drummers, and Jesuit missionaries came from far and near to see the new outfit; and Evie, swathed in furs and a picture of loveliness, gave many exhibitions of the speed of the moose, and incidentally of her own skill with the reins.

'I tell you, in a year or two we shall see moose-sledges driven up and down all the country,' Mr Field prophesied one day.

An old missionary, hearing the statement, shook his head gravely. 'It's not the first outfit of the sort we've seen in these parts,' the veteran stated. 'Thirty years back a Hudson Bay factor hit out from Winnipeg with a moose-sledge. The heavy beast found a weak spot in the ice, and the whole shoot disappeared for

good. That made moose unpopular for quite a while. The next I saw was driven by a little French guide named Druille. One night he got half the wolves in the country following him, and all they could find after the chase was the upturned sledge.'

Mr Field was thoughtful. 'You mean that moose-driving generally ends in a tragedy?' he observed at length. 'That's what I'm scared of, and I'll see they don't keep the animal after this winter.'

Early one morning Potts set out with the sledge for Kilween, evidently intent upon beating Tim's record. It happened that a party of Indians, negotiating the same creek some hours later, heard cries for help issuing from behind an island. On investigating, they found an angry, red-eyed moose, with bristling mane and tangled harness, stamping round an upturned sledge, under which its terrified driver had sought refuge. Potts went home on foot, the Indians taking charge of the moose; and when Tim finally conveyed the animal to the stable, the great wales down its right flank told him how the accident was brought about.

Shortly after this happened Mr Field turned to Tim one morning and observed that the milk consumption at the cabin was surprisingly high. 'Nine cans in a month!' he pointed out. 'I fancy there must be a leakage somewhere.'

Tim promised to look into the matter, saying that he would question Top-Hat John, who would own up like a lark if he were guilty.

'John, are you a good Christian?' asked Tim solemnly, finding the boy alone in the shanty.

'Blame good Christian,' John answered with equal gravity.

'Then why in thunder have you been stealing the milk, my son? Nine cans gone in a month, and no milk-puddings!'

John wagged his head cunningly. 'Potts like milk, you bet your life,' he affirmed. 'I catch him drinking out of can. Him give me good drink not to tell. Then we share and share alike. Savee?'

The boy climbed on to an empty hogshead and drew a can of evaporated milk from its hiding-place above one of the cupboards. The tin was half-full, and on either side of the lid a hole had been punched so that the contents could be poured out.

'I thought as much,' muttered Tim. 'Regales himself on the company's milk during my absence. Well, I'll settle this business for good.'

By means of a fountain-pen filler Tim injected a good tablespoonful of paraffin into the half-empty tin, and carefully replaced it above the cupboard.

'You tell and I'll whack you,' he informed John. 'You steal any more milk and I'll whack you again. Savee?'

At breakfast next morning Tim recognised the can of milk on the table as the one he had

doctored. Potts handed it to him; on which he tossed it into the stove. Top-Hat John exploded with laughter. 'Him take blame good drink, anyway,' the boy blurted out. 'Him sick as dog, eat no breakfast.'

Potts glared savagely at Tim. 'I've put up with your quiet insolence and superior manner for long enough,' he stated; 'but you'll find you've kind of made a mistake if you play dirty pranks of that sort on me.'

'You should act squarely, then you wouldn't get stung,' answered Tim, unruffled.

Potts leapt to his feet. 'What in blazes is it to do with you, anyway?' he demanded viciously. 'I tell you what, Shields, it's about time one of us got out of this show.'

Tim turned quietly to the Indian boy. 'John, take my snowshoes across to the bungalow and renew the broken strings,' he said; and when they were alone he turned to Potts. 'I've wanted to have a face-to-face talk with you for some little time back,' Tim began. 'We've lived together long enough, Potts, to get to know each other pretty well, and as a rule a man's past history doesn't matter much in these parts. But you're an exception. Suppose we just go back a matter of four months, which takes us into the middle of the forest fire season. Whitehorse City, away down the line, was burnt out, but curiously enough the hotel survived, though it was in the very centre of

the fire-belt. The clerk was the last to make for the lake, and with him he took about seven hundred dollars snatched from the till at the last moment. When he did not return after the blaze-up, every one thought, of course, that he had perished, like so many others, and the loss of the seven hundred dollars was covered by insurance. But as a matter of fact the man got out all right, tramped up the rightaway to Beswick, took train north, then by canoe to Kilween. Do you follow?'

'You lying devil!' hissed Potts. He snatched up the coffee-jug, evidently intent upon hurling it at his companion; but Tim's fist shot out in the nick of time. The city clerk staggered into a corner, and for a moment sat still.

'You call me that again and I'll flay you. I've got a pretty good memory for faces, Potts, and I saw you in Whitehorse City myself. When I was there last month I made inquiries, and actually procured a photograph of the missing clerk—bought it from a dancing-girl for two dollars. Here it is.'

Tim slammed the miniature print on the table as Potts rose to his feet, then replaced it in his pocket-book.

'That black moustache you've grown since alters you no end,' he stated finally. 'But if you take my tip you'll wait another year or so before going south.'

(Continued on page 200.)

STARS AND PLANETS.

By J. ARTHUR HILL.

ARTEMUS WARD had one little difficulty in regard to the stars. He could understand how we measured their distances, and the amount of their mass, and the speed of their motion; but what always gravelled him was: how had we discovered their names? There are many wonderful things in astronomy, but Artemus's special difficulty is not the chief one for most of us; though, indeed, the history of the christening of some of the stars is lost in the mists of antiquity, and we should very much like to know the reasons which led their godfathers to a choice. Sirius has something to do with sunstroke (Greek, *seirios*), and Arcturus is the guardian of the Bear; but the Bear and the zodiacal constellation-names hail from prehistoric times.

THE SOLAR SYSTEM.

Our system is only a comparatively small affair. The sun—which is so important to us that we call it *the* sun, as if there were no others—is only one of the smaller stars; and if it were as far away from us as some of the stars which we see, it would be quite invisible. Between our system and the nearest star—or, rather, the star which, out of those whose distance has been measured,

is found to be the nearest—there is a space-gulf of about 25,575,000,000,000 miles, or 275,000 times the distance of the sun. Light travels at the rate of 186,000 miles a second; therefore it reaches us from the sun in eight minutes; but from this nearest star (Alpha Centauri, in the Southern Hemisphere) it takes over four years to cross the vast space which separates us from it. Yet our little sun is quite a respectable size if we think of it in miles, its diameter being 866,400, or about a hundred times that of the Earth. As to volume, its size equals over a million Earths. It is of course much less dense, being probably still molten, for the most part, with a large proportion even gaseous. Its density is one-quarter that of the Earth. It has two motions, spinning round on its axis in six hundred and seven hours, and at the same time moving through space at about ten miles a second, toward a point in the constellation Hercules, and taking us with it whether we will or not.

The system is made up of eight known planets with their satellites, a lot of asteroids, which seem to have resulted from the burst-up of a planet revolving between Mars and Jupiter, and a few comets. By the way, there is a difficulty

about the burst-up theory of the asteroids, for if they had a common origin their orbits would be in the same plane, and this is found not to be the case. Like many other astronomical facts, it has to be left unexplained until we find other facts which will point us to a more indisputable theory.

The order of the planets, starting from the sun, is: Mercury, Venus, Earth, Mars, asteroids, Jupiter, Saturn, Uranus, Neptune. Their distances from the sun are in a sort of orderly progression, in accordance with what is known as Bode's Law, which holds good for all of them except Neptune, which the law would place farther out than it really is. Probably there is a still undiscovered planet beyond. It was because, according to Bode's Law, there ought to be a planet between Mars and Jupiter that this space was examined with more care, with the result of the discovery of the asteroids. The law may be shortly described as follows: If we take the series of figures, 0, 3, 6, 12, 24, 48, 96, 192, in which each figure represents the double of the preceding one, and add the number 4 to each, we get 4, 7, 10, 16, 28, 52, 100, 196. These figures very nearly represent the proportional distances of the planets—for example, Mercury, 3.9; Venus, 7.2; Earth, 10; Mars, 15.2; asteroids, about 28; Jupiter, 52.9; Saturn, 95.4; Uranus, 192.0. The mean distances of the various planets from the sun, in millions of miles, are: Mercury, 35.9; Venus, 67.0; Earth, 92.7; Mars, 141.0; Jupiter, 482.0; Saturn, 884.0; Uranus, 1780.0; Neptune, 2780.0. Their period of revolution round the sun is of course in ratio with their distances, increasing as they recede. Mercury's year is eighty-eight of our days, that of Mars is six hundred and eighty-six, and Neptune's is sixty thousand. So, if there are human beings on Neptune, a Methuselah of nine hundred and sixty-nine years would be only six years old when he died; and the supposed span here, of seventy years, would be only half a year there.

This matter of the habitability of the other planets is a perennially interesting one. It imports living interest into the dreary waste of mathematical physics. We cannot yet be sure of anything in this department; but there is a good deal to be said, not unprofitably.

Dr A. R. Wallace, the great co-discoverer with Darwin of the effect of natural selection in producing differentiation of species, thought that our Earth was probably the only abode of beings of our kind. It may be so, but the balance of evidence seems on the other side. It is true that the larger planets, such as Jupiter and Saturn, are still probably too hot to admit of life as we know it, while the Moon is too cold and Mercury too small and too much exposed to extreme heat and cold; but in the cases of Venus and Mars the conditions are so very nearly like those of Earth that the supposition of some form of life is reasonable. Venus is too much wrapped in cloud, and is consequently too brilliant,

for any close observation of its surface. But Mars has very little water on it, and consequently can be continually examined; and at its nearest to us, when the Earth comes between it and the sun, as it did in 1909, and will do again in 1924, the distance is only 35,000,000 miles.

IS MARS INHABITED?

There is solid land, and perhaps seas, on Mars, and there is an atmosphere. There is snow on the polar regions, and there are green areas, which wax and wane with summer and winter, in the temperate and tropical zones. The force of gravity is less than on the Earth, but is comparable therewith. A pound weight here would weigh half a pound on Mars. Consequently a man of ordinary human strength would feel an extraordinary buoyancy on Mars. He would be able to jump twice as high and twice as far as he would here, and could go upstairs two steps at a time with the same exertion as is required for one step here. But of course, if there are living and intelligent beings on Mars, they will doubtless have evolved along lines parallel with the other conditions of the planet, and will differ in many ways from the inhabitants of the Earth. It is worth noting that as Mars is smaller, and has therefore reached a colder and more mature planetary existence than Earth, we are justified in supposing that its inhabitants, if there are any, will have reached a higher stage of progress than we have. They may have harnessed to their use forces of nature with which we are still unacquainted.

The chief evidence for the Martians' existence is the so-called canals. Astronomers are divided in their opinions respecting these markings; but the opinion seems to be gaining ground that they are at least artificial, not natural. At one time it was thought that the narrowest line that could be visible to us must be sixty miles wide, and this seemed to render artificial construction improbable. But it is now recognised that the streaks seen or photographed may be less than a mile wide, perhaps even only a quarter of a mile. The markings are so numerous and so geometrical that intelligence and design are strongly suggested; and the green patches which appear in their neighbourhood, in what seems normally a desert, are probably due to vegetation which is made possible by the great system of irrigation which the canals seem to indicate. If the water comes from the polar ice-caps, as seems likely, it must somehow be made to run uphill, for Mars bulges in the middle, like all the planets and many men. But the construction of extensive pumping-stations is probably not beyond the powers of the Martian engineers. The planet rotates in almost exactly the same time as Earth—namely, twenty-four hours and a half. It has, however, two moons, discovered in 1877, and so small as to be visible only through a powerful telescope. One of them revolves round its primary in the remarkably short period of seven hours and a

half. The result of this is that to an observer on Mars this moon will rise in the west and set in the east twice every night. The other moon, travelling more slowly than the rotation-speed of the primary (revolution in thirty hours), will seem to travel from east to west in the normal fashion. It is a curious fact that Swift, in *Gulliver's Travels*, makes his astronomers, in the flying island of Laputa, discover two satellites of Mars, one of them revolving in ten hours. The fact of there being two might seem a reasonable guess; but the revolution-time of ten hours, which turns out nearly correct, would have seemed wildly absurd before Professor Asaph Hall's discovery in 1877. There is no other instance in the Solar System of a satellite revolving faster than its primary rotates; and at first sight the fact seemed to conflict with the nebular hypothesis, according to which the smaller bodies of a system are flung off from the larger ones while fused or gaseous, and therefore ought not to be found travelling faster than the original body. The apparent anomaly is, however, now explained by the theory of tides. The friction of the tides, as they are dragged across a planet by a moon's attraction, tend slowly but surely to retard the planet's rotation. Our own day is accordingly lengthening. The moon's day has lengthened until it is as long as its revolution; that is, it always turns the same face to us. The same thing has happened with Mercury. So with Mars; its inner satellite, being only 4000 miles away, caused such great tidal friction that the planet's rotation was slackened until it was lower than the satellite's revolution speed.

Jupiter is the giant of our system. His

diameter is eleven times that of the Earth. He rotates very rapidly for his size, his day being only ten hours long. This speed has made him bulge more, equatorially, than the other planets, and his oblateness is visible with a very low-power telescope, as are also his four principal moons, which may be made out with a good field-glass. Little is known about Jupiter except that his density is low—about like that of the sun—and that his surface is cloudy or vaporous. At such a high temperature many substances will be vaporised which are liquid or solid here.

Saturn is a beautiful object, seen with a good telescope; but we know little about it. The rings are probably composed of innumerable small particles of the asteroid type, perhaps the débris of an exploded moon. The heavens must be a gorgeous sight from the surface of Saturn, for the planet has ten moons as well as the rings.

The Solar System's relative sizes and distances may be usefully impressed on the mind by the following: Think of a well-levell'd field with a globe in the middle, two feet in diameter. This represents the sun. Mercury is a grain of mustard-seed 82 feet away; Venus, a pea, 142 feet from the globe; Earth, also a pea, at 215 feet; Mars, a rather large pin's head, at 327 feet; the asteroida, small grains of sand, at 500 to 600 feet; Jupiter, a moderate-sized orange, at a quarter of a mile from the central sun-globe; Saturn, a small orange, at two-fifths of a mile; Uranus, a large cherry, at three-quarters of a mile; and Neptune, the same, at a mile and a quarter. The nearest fixed star would be about ten thousand miles away, on this scale; so we need not fear a collision just yet.

THE BRIGHT EYES OF DANGER.

CHAPTER XIII.—'SIRS, I DO CALL THIS MAN WORTHY.'

NEXT day, I reflected that I had done nothing to forward the private business that had called me to Edinburgh, which was to see the lawyer who had charge of the affairs relating to my succession to Darehope. There were one or two legal formalities to settle, tedious but needful matters; and, as my lawyer had a name for honesty and brains, I had thoughts of telling him of the extraordinary house by the sea. A caddie conducted me to his office, up a stair in a narrow street. His clerk showed me in, and I discovered a tall, lean gentleman of ruddy cheek sitting among a sea of papers that had flowed over his desk and spilled on to the floor.

'Mr Peter Scott?' I said.

He ran a humoursome eye, brisk and blue, over me.

'I'm all that's for him,' said he; 'and you, sir?'

'Edmund Layton from Westmorland, come to see you on the business of the estate in Liddisdaill.'

He rose, tumbling more papers to the floor, shook hands most heartily, and after accommodating me with a chair, told me that I favoured my late mother, 'Miss Jean Elliot o' Darehope' that was. 'Yes, sir, ye favour her extraordinar'; and, if I may make bold to say it, I hope ye've fallen heir to her good sense as weel as her looks and the bonny place in Liddisdaill. No offence, ye ken!—no offence! She was a by-ordinar' woman!'

'She was an Elliot,' I said, not without pride.

'A Border Elliot. There's few like them. Ye remember (um—um—how does the stave clink again?) Oh ay!' He hummed a note or two, and broke suddenly into the first verse of

*Elliot's o' the Middle March,
Glave and spear and spur.*

It was a mediocre performance, in a voice somewhat the worse for wear, but he gave it with refreshing zest and enjoyment.

He stopped as suddenly as he had begun, and waved a hand at the litter of papers.

'This is no' a place for singin', and I am an auld fool,' quoth he with a little sigh. 'Indeed, Mr Layton, ye'll be thinkin' that I'm only a middlin' serious body; but, troth, gin a writer were to cast his mind in the moulds o' his clients the trade would be a sorry one. Most o' folk (at least in my experience) wait until trouble tirls at their door, and then come to us poor lawyers wi' lang faces, layin' the wyte o't on everybody but themself's! Ay, we get mony disagreeables in the practice o' the profession; but I am happy to say, sir, that my late partner and I have been the doers for Darehope for forty year, and I wish a' my clients gave me as little trouble. I am fameeliar with your affairs—fameeliar, sir.' He had a quaint habit of finishing up a remark by repeating a word or phrase he had used.

We talked of my affairs for some time, Mr Scott producing a bundle of papers from a deed-box, and regaling himself, if not his client, for nearly an hour with explanations about my little estate, all very accurate and business-like no doubt; about casualties and excambions and infetments; but the jargon was as Hebrew to me. Before he had finished my head was fairly reeling. In truth, my mind ran so much on the doings of the last night but one that I had difficulty in avoiding the appearance of ill-manners. I think Mr Scott must have observed this, for he broke off to say, 'Ye look weary, Mr Layton. No doubt ye had a lang journey from Westmorland. I should have considered that. The business of signin' your name and what not can keep till this evening, when I beg the honour of your company to supper. I'll take no denial—no denial, sir!'

I thanked him, and accepted his hospitable offer.

'It is a great pleasure to meet one o' your family—a great pleasure. By the way, ye didna mention where ye left your mails at.'

'I am at the "White Horse,"' I told him.

'A decent hostelry, no doubt,' said he, nodding his head in approval. 'I hear there's word o' the name being changed to the "White Rose." To let you understand, ye see the White Horse figures on the shield o' Hanover, and if the cat louns that side o' the—— But, preserve me, here I am meddlin' in politics!' and he gave me a look sidewise. 'And how is canny Westmorland like to gang this time? 'Twas a sorrowful business at the "Fifteen." Whig or no Whig, I could have spared many a man before the Earl—many a man, sir.'

Jacobite or Royalist, he could not have taken a straighter road to my heart, for my Lord Derwentwater's name, despite his politics, was ever to me a cherished one, and I told him so.

'Your politics are not red-hot, Mr Layton.'

'They are like yours, for King George. My

father took the field in the "Fifteen," and I have no mind to act otherwise, should His Majesty need my service.'

'Well enough said,' said the old gentleman. 'But a word to ye! Keep your own counsel! King George will see the end o' this business; and to my thinkin' there will be heads on the Scotch Yett at Carlisle afore many months gang by. But it will be the deil's ain business. There are fools on baith sides. As for me, I'm an auld writer peaceably inclined. I have titles here o' folk that are wearin' the White Cockade, though I wadna seek to deny that most o' my clients, like yourself, Mr Layton, are for Brunswick. So I sing small, as the sayin' goes, and gang my own gate. Do ye the same, until ye get across the Border again. Mind ye, the Pretender has a way with him—oh! a way with him!'

'Way or no way,' I said, 'it would be a strange day when a Layton forgot his rightful king.'

'Again, well enough said! But he that lives longest sees the maist ferlies, and I ken things that are queer enough to send a wheen folk to the Tolbooth.'

'I'm an honest man,' I began, a little loudly perhaps. He stopped me with a wave of his hand.

'I'm no' hard o' hearin',' he said, taking a pinch of snuff deliberately. 'Ye might as well raise your voice on the top of the Berwick Law as in my office. Honest here! honest there! I am just as honest as the world will allow an old writer body to be. But—here he cast off his quizzing smile, and laid a hand on my shoulder—'I'm an older man than you, and I've seen as honest men as you run against the horns o' circumstances. Tak' my advice. Keep your opinions to yoursel' till you cross the Border again, for the town is fairly hotchin' with spies and jacks-o'-both sides. I'm speakin' as a friend—as a friend, sir!'

I made haste to give him thanks for his advice, for indeed the old man was to my liking. He asked when I proposed to ride south.

'As for that, I have a day or two to spare.'

'Ay!' he said, smiling, after a pause, 'an' the guns o' the Castle and the Pretender's drums are ticklin' your ears, and you're thinkin' o' bidin'. Weel, weel, I dinna say that I blame ye. I was young mysel'—once.'

He led the way down the stairs. It was nearly high noon, a bright September sun flooding the streets. He was evidently well known and respected, judging by his reception and the degree of his acquaintances.

'A good mornin', gentlemen,' he waved to a passing group. 'That's the Lord Provost. I wadna niffer places wi' Archie Stewart. I doubt if the Pretender is greatly ta'en up wi' his judeicious delays. Still and on, Mr Stewart is a kind friend and a level-headed man; but when the smoke clears I wadna be surprised if the Advocate sees in him a handy scapegoat for ony blame for the capture o' the city.'

'When the smoke clears! Then you think the Stuart cause hopeless?'

'If I wore the White Cockade I would wish for some mair siller in the Prince's sporrán. No doubt, for the credit o' his cause, he keeps down cutpurses and such-like; but there are whispers already that Edinburgh will have to pay twa or three times through her auld nose for his veesit here, and that means gude kens how much clapped on to the assessments. I ken the toun and the Lowlands as well as Mr Secretary Broughton, and the very best way to get to their hearts is through their purses—the very best way, sir.'

This was true of most people, I thought. All I said was that I supposed the rebel army must live somehow.

'I see very little necessity for it, as the judge said to the man in the dock. No doubt, afore

the gowks in London waken up, Charles Edward may be owre the Border and levyin' what he can on the towns that arena garrisoned; but it fair overcomes me. It's a kittle business to be wantin' siller—a kittle business, sir!'

'France?' I ventured.

'France might have helped to keep England thrang baith here and in Flanders; but last May's work at Fontenoy has heartened her. I wadna lippen to her. To be sure, there's siller comin' now and again from France. Lord John Drummond is a French subject, very chief at the French Court, his hand eident against His Majesty and the Kirk and State. But I would count but little on France. There's the Tron chappin' twelve! I have a tryst that I have kept this thirty year every day except the Sabbath. Ye'll just come awa' wi' me.'

RAILWAYS AND CANALS.

By T. GOOD.

THE cost of the carriage of goods is a subject claiming, and rightly claiming, special attention. A Royal Commission was recently inquiring into some aspects of the railway problem. Traders are protesting against recent advances of railway rates, and current discontent is bringing railway nationalisation within the range of practical politics. A big agitation is also being carried on in favour of the nationalisation and resuscitation of our canals. In these circumstances no apology need be offered for calling attention to one or two aspects of inland transit that are apt to be overlooked. Indeed, a great deal of misconception exists in the public mind regarding railways and canals, and it is of prime importance that this should be cleared up before the State, or any party in the State, is committed to any new policy. Without a doubt, something might be done to improve our railway service and our canal system; but before anything is attempted by the State—certainly before any vast expenditure is incurred—the special features of inland transit in this country should be clearly understood. Comparisons are constantly drawn between the apparently low railway and canal rates of continental Europe and the apparently high rates in this country, and it is assumed and argued that with State ownership we could have rates as low as those on the Continent; but this is a serious mistake.

With regard to the canals, it may be observed that the natural conditions in this country are such that we cannot possibly have the cheap and speedy water transit of Continental countries. Generally speaking, it may be said that the industrial centres on the Continent served by inland waterways are comparatively flat, whereas industrial Britain is very hilly. It follows from

this that canal construction is cheap on the Continent, but costly in Britain. This may best be illustrated by a simple statement of fact. In France they have seven thousand and six miles of navigable inland waterways, of which no less than four thousand three hundred and ninety-two miles are natural river; in Germany, out of a total of seven thousand and thirty-eight miles, five thousand eight hundred and fifteen miles are natural; in Great Britain, out of four thousand and seventy-five miles, only one thousand four hundred and eighty-two are natural. If our waterways were widened and deepened to accommodate large barges such as they have in France and Germany, then it is safe to say that at least five miles out of every six would have to be artificial; whereas, taking the Continent generally, less than two miles out of six are artificial.

The canals of the Continent, about which we hear so much, owe their success, if not their very existence, to large and deep rivers flowing through extensive tracts of level country. The inland waterways of Germany, France, Belgium, Austria, &c. have been at least half-made by nature. The rivers in those countries lend themselves naturally to canalisation; but in Britain the rivers are narrow and shallow, have many weirs, and are in very few cases suitable for economical canalisation. Thus it follows that our canal construction must be abnormally costly.

There is also the question of locks. It is quite common on the Continent for barges to go from ten to twenty miles without a lock to interrupt them, the land is so level. In this country we have a lock for every one and a half miles of navigation. In the two hundred and thirty miles that separate Berlin from Hamburg by

canal there are only three locks. On one of our canal routes between London and Liverpool, two hundred and sixty-seven miles, there are two hundred and eighty-two locks. Of course these are extreme cases; but, on a rough average, we have five times as many locks as they have on the Continent, distance for distance. Our lack of level country, our lack of suitable rivers, the abnormal number of locks we have, and must have, in any canal system we may devise, the great number of tunnels, the delays at the locks, the expense of pumping up to the top levels again the water that comes down through the locks, and of maintaining the locks, combine to make economical canalisation on any large general scale practically out of the question in Britain; though, of course, improvements are possible in the case of some of our existing canals. The point here, however, is that those who believe that what canals do for the commerce of Germany, France, and Belgium, canals could do for England, Scotland, and Wales, are hugging a delusion.

Similarly with the railway branch of transit, or the cost of carriage, it is very easy to draw striking comparisons between British and foreign ton-mile rates, usually showing our charges to be from 50 to 150 per cent. higher than those of our rivals, to contend that British traders are thus handicapped, and to argue that with State-owned railways we could have rates as low as those of other countries; but the people who think and talk in this strain ignore three or four cardinal points. They forget that railway construction has been extremely costly in this country; they forget the geographical features of the country; they forget the density of the population, and what it involves; and they forget our short haulage distances—the supreme point in the problem.

To begin with, we were the railway pioneers. We had all engineering problems to solve for

ourselves, and often at great cost. Our rivals, who started to make railways much later, had the benefit of our experience. We had to build with costly materials, with primitive appliances, and with unskilled labour. Our rivals were far better circumstanced when they began to build. Again, in our thickly populated country we had to pay dearly for land, we had to bridge or tunnel big towns, and make fine stations in the centres of cities. Railways in other countries have had cheap land, and have in many ways been encouraged and aided. And, again, while our railways have been put to enormous expense in promoting Bills in Parliament, and in overcoming the opposition of local authorities and property-owners, foreign railways have been welcomed. Thus the fact that the capital cost of our railways has been far greater than that of others is not to be wondered at; and, naturally, the necessary interest on the railway capital has to be paid by the traders and travellers who use the railways.

Then there is the question of distance. Relatively to population and traffic combined, Britain is the smallest country in the world. With exceptionally short haulage distances we are bound to have exceptionally high rates. A goods-wagon sent ten or twenty miles in this country has to be loaded and unloaded the same as one sent fifty or one hundred miles on the Continent, or five hundred or even one thousand miles in America. It has been calculated that in the group of iron trades, for example, the average hauls for raw materials and finished goods, mines to furnaces, and works to ports, are less than thirty miles in Britain, against one hundred and fifty in Germany, and between four and five hundred in America. Obviously, we cannot have our ton-mile rates low; obviously, also, if our rates are high our miles are few. Such, briefly, are some of the facts and factors in the general cost of carriage.

THE HAUNTED VILLA OF CHENNEROI.

By M. F. HUTCHINSON.

There are links which must break in the chain that has bound us;

Then turn thee and call on the chief of thy choice!

BYRON—*Napoleon's Farewell.*

COLONEL HERRIES, of the Royal Field Artillery, sat down on the edge of the bed with a sigh of satisfaction. Then he smiled suddenly as he thought of the struggles of some of his beloved gunners until they had succeeded in understanding a French cooking-stove and the array of burnished pans placed on it before a sufficient supply of hot water could be obtained. Those brightly burnished pans had been recklessly handled. They and everything in the little villa spoke of an excellent and careful housewife; the bedroom was full of what Colonel

Herries described as flummeries. He had tried to remove the curtains at the windows gently and carefully, but the elaboration of the fastenings made him impatient. They stood wide open now, and unsecured hangings flapped in the wind. Yes, a woman's room!

What had become of the owner of the little house? It stood intact, and showed no sign of the vigorous bombardment, though two yawning pits in the garden spoke of the fall of shells.

First, the violence of the German fire had made it necessary for French troops to retreat from Chenneroi; but that day had seen it gloriously retaken, and the German line pushed far back by relentless fire and vigorous pursuit.

The brigade of artillery commanded by Colonel Herries, after a particularly splendid effort, was ordered to remain in the place for a brief rest.

The colonel looked a little wrathfully at the feeble light of the candle; he had a poor opinion of the candles and matches of the French. He wanted to read again a little packet of letters from home; but since he knew them by heart, he could say them over and over until, to the sound of the measured footsteps of the sentry posted outside, he slept.

It was the memory of tender sentences which made him think regretfully of the owner of the dainty little villa. He hoped she was in safe shelter somewhere, and that none of her possessions would be seriously injured by those who had taken possession of the place. He must see to it that his men, great at polishing, left the pans as brightly burnished as they had found them. How came it, he wondered, that the Germans had not used the house?

He was dog-tired, and yet sleep did not come at once. He was too comfortable, and this was the cause of his restlessness. He ought to get up and lie on the polished boards of the floor. A bed after three weeks in dug-outs and rough shelters!

Was it in his sleep that he heard a footstep and the faint sound of a woman's skirt? He was at home again, and his wife——

A footstep! He sat up erect, his hand feeling for the revolver under his pillow. That momentary exquisite sensation of home surroundings was followed by one of profound uneasiness. Where was he? He remembered perfectly he was in the front bedroom of the pleasant little villa, and outside paced the sentry. He had gone to bed in the dark, grumbling a little at the feeble light; but now the room seemed brilliantly illuminated, as if, after all, his resourceful gunners had fought a battle with the electric light, and conquered!

Close to the open window was a figure—a woman's figure. The real owner of the house? Apologies rushed to his lips. She must not be afraid, this unknown woman; neither she nor her house would be injured by those who had taken forcible possession—*à cause de la guerre*. He was actually pleased with the remembrance of that French phrase.

His fingers no longer clasped the revolver, but it seemed impossible to speak the words on his lips. That figure dominated everything, the silent figure of a woman holding a book, quite a small book, in clasped hands. He wished he could see her face distinctly.

Why, it was a dream!—he was sitting up in bed, staring straight before him into the darkness—just a dream, the result of tremendous exertion and constant strain. He could not lie down again. He found the matches, and then with a sulphurous smell a flame fizzled up, and he

lit the candle. What a fool he was to go in for an attack of sheer jumps! The loose curtains and muslin draperies at the window, moving in the night air, had made him think he saw the figure of a woman, a woman holding a book.

When the candle burned steadily he held it up and saw close to the bed a little table on which lay three books. He stretched out a strong hand and picked them up. One was exactly like the book held by that figure. No, of course not; it was not an actual figure, just a trick of the imagination.

He opened the book, and found pages yellow with age and worn by time, but no written words. At one side there was evidently a pocket. He found it, and in it papers, one an ardent love-letter, unsigned, written in French in a large flowing hand.

Where had he seen that writing? There was an odd appearance of familiarity about it. Wasn't it rather a shame to look at these things, old though they were? Something seemed to compel his fingers to unfold the second paper—a map—a map of the northern frontier of France and the whole of Belgium. Down one side names were written, the names of Generals familiar to all soldiers because of their share in the Napoleonic wars, and inscribed in that oddly familiar writing.

He held the map closer to the candle, and saw a cipher in one corner; the map had been used and carried by the great Napoleon himself. What a find! Even as the words were on his lips he corrected himself. Of course the map was not his; it belonged to the owner of the house.

Here and there were marks made in blue ink. He bent over the map, studying it more and more closely.

Once more a strange sense of unreality seized him, and for a moment the paper shook because the fingers holding it trembled.

As he gazed small red circles or blotches appeared on the map. He bit his lips and held his breath—the position of the Allies as it was at the moment! From these faint circles of red went arrows converging upon a definite point. They had not been there when he first looked at the map.

Drops of sweat stood out on his forehead, and impatiently he rubbed them away with his left hand.

After close study he folded up the map and put it back in the pocket of the little leather book. For ten minutes by his watch—its soft ticking seemed to fill the room—he left the map where it was. Again he took it out, opened it, and saw no trace of so much as a red line, though he held it close to the candle. Then the same thing happened: the red blotches appeared, and the converging arrows.

The relief sentries were being posted; he distinctly heard the familiar sounds, and with

a swift movement sprang out of bed, and took candle and map with him into an adjoining room.

'Marshall, it is a cruel shame to wake you!'

'Wake me? I can't sleep; I'm too comfortable. What's up?'

Herries sat down and recounted his weird experience. 'Now, look here, take the map and have a good look at it. There isn't a doubt as to whom it belonged to. Just look at it, and tell me what you see.'

Major Marshall, wide awake and alert, did as he was asked. 'My word, it's a find—precious loot, Herries!' He read out the names of four Generals, and commented on the blue marks.

'I see nothing else. Hold hard a minute, though! It must be the reflection of the candle-flame. No, it's not that. Red marks, circles—a whole lot of them! I say, this is queer! It is our front—the whole allied front—Herries!'

'Do you see any other marks?'

'No. By Jove, yes!—arrows, red arrows, all pointing in the same direction. What in the name of wonder does it mean?'

'What do you think yourself?'

'What do I think? What do I think? It is madness; but those lines of Byron's are just rattling in my head. He makes Napoleon promise to return just when his help is needed most. It looks as if he were pointing the way. Are we mad, Herries, you and I?'

'We must look at it in broad daylight. We must try to sleep, Marshall; we both need it badly enough.'

'Sleep? A manifestation like this to come to a couple of Englishmen! Napoleon hated us. I say, Herries'—

'Let us wait for daylight.'

Herries took the pocket-book, put it under his pillow, and with his head on it slept profoundly, to wake in the gray light of early dawn. He would not allow himself to look at the map until the actual light of day was strong enough.

Chenneroi echoed and re-echoed to military sounds. A regiment of French infantry and a brigade of cavalry clattered in from the south, and a fine battery of artillery unlimbered in the Place. After all, Chenneroi had inhabitants who had braved the terrors of the war, and looked on.

A priest, busying himself over hot food for these soldier-children, answered questions Colonel Herries put to him about the little house, unscathed by shell-fire, which stood at the foot of the hill on a road leading to the ruins of the ancient Hôtel de Ville. There was the new Chenneroi and the old, it appeared.

'The owner of the house, Monsieur le Colonel, was a true *grande dame*. Her history! Must we speak of these things? Her mother was very beautiful, *ravissante*; and it was understood that she was a friend—perhaps too great a friend—

of one who possessed all and lost all save his sovereignty over some faithful hearts. She lived to a great age. Her daughter—as beautiful as her mother, and as solitary—died, monsieur, when the Germans took possession of Chenneroi. She was old, monsieur, very old and feeble, and her heart failed; the excitement was too much for one so aged. I buried her at night, because of the shell-fire; but the guns roared all that night. And so you slept there, monsieur? Well, madame would not harm you; are you not fighting for our country?'

As he talked the priest never ceased to cut huge slices of bread, and the English officer helped him.

'When you have more time, Father, I have something to tell you.'

'God be with you, my son!'

Colonel Herries raised his hand in salute. How the English have learned to admire these French priests!

Then, standing in the full sunlight, Major Marshall by his side, he opened the map, and saw it just as it had at first appeared. Would they see the red lines and circles again? They watched almost breathlessly, quite unnoticed by those who hastened by. Maps were in the hands of all officers. Two brave Englishmen consulted together.

Again they saw the red circles and arrows. Marshall pointed with a trembling finger. 'We smash their line of communications here; we surround them there! Herries, you can't keep this to yourself?'

'No,' was the serious answer, 'we certainly must not.'

Officer after officer studied the map, and each in turn, ignorant of any one else's experiences, saw the wonderful appearance of those red lines and arrows.

The Headquarters Staff, at this moment in the titanic conflict, had two alternative plans, and the one most favoured by the experts coincided exactly with the suggestions on a map one hundred years old.

That afternoon two English officers cut all the flowers still blooming, because of the sunny autumn weather, in the garden of the villa, deeply ploughed though it had been by shells. They carried them to the grave pointed out by the priest, and piled them high upon it. They knelt there, simple gallant soldiers, while prayers for the dead were tenderly read.

They spent another night in the little villa, and there the chivalrous Englishman, having debated the question much with himself, burnt that ardent love-letter intended only for a woman's eyes. He found himself wondering why the daughter had never done so. Then he fell asleep with a feeling of deep peace, and left Chenneroi the next morning, confident of victory—victory for the allied forces.

THE SINGAPORE RABIES EPIDEMIC OF 1884.

MANY strange things have happened in the island of Singapore, best known as the telegraphic centre of the Far East. This is a description of one of the worst scares Singapore city has known during recent years. Mr William T. Batten, who told the story, was for many years stationed on the island; and the incidents here described are still fresh in his memory. Doubtless these will be recalled by many readers who were in Singapore at the time. For obvious reasons, the identity of the people concerned has been withheld; though their names have been made known to the Editor. Otherwise the narrative is accurate in every detail.

The pariah dog of the Far Eastern city is usually a rough-haired, mangy-looking creature, nearly as large as a sheep-dog. He is a mongrel; in fact, he is the most mongrel mixture of all mongrels, and in the United States would be described as a 'yaller dog.' In all cities where these dogs exist it frequently becomes necessary to destroy some of them; otherwise they would multiply very fast and become a great nuisance. Until the year 1884 the method adopted to reduce the number of dogs in Singapore city was somewhat barbaric. The task was allotted to the municipal dog-killers, low-caste Madrasses, and the days on which the killing was to take place were advertised some time before in the local Press. Thus the owners of dogs received proper warning, and were able to take precautions that their canine pets were not running loose about the streets.

Dog-killing days usually occurred in the first week of each quarter, when the municipal dog-killers were to be seen sallying forth, usually three men working together. Two of them carried heavy clubs, about five feet in length and four inches in diameter at the thick end, and the third man attended a bullock-cart which they took with them on their round.

As soon as a pariah was seen, one of the men armed with a club would creep up behind it, and, taking the poor brute unawares, endeavour to despatch it by one blow. The Madrasses, however, evidently found it easier and more certain first to cripple the dog by dealing it a blow across the spine, and then to despatch it by a second or by several blows on the head. This was the usual way they went to work.

The rabies epidemic broke out in the year 1884, and after that a different method of procedure was adopted. In place of the club, the municipal dog-killers were equipped with long-shafted tongs so fashioned that they would grip and hold a dog by the neck or by any other part of his anatomy more convenient, and

a large cage on wheels was substituted for the bullock-cart. When one of the men succeeded in seizing a dog a companion at once came to his assistance, and between them they hoisted the captured pariah into the cage. It was no uncommon sight to see this cage passing through the streets half-full of dogs, the animals lying down or standing quietly, as though they knew what was about to happen to them. The dogs were kept for twenty-four hours, so that owners of missing animals might claim them. Thereafter the animals were taken out of the cage and shot one by one. Later it occurred to some one in authority that a much better way of finishing off the brutes would be by backing the cage and its contents down a slope into the river, and for years afterwards this plan was in operation. From this it will be seen that the dog-problem in Singapore city always received the close attention of the authorities.

Early in the year 1884 the steamship *Coblentz* put in at Singapore harbour with a large consignment of dogs, which her master, Captain Schmidt, had brought out from England. It was duly advertised in the *Singapore Free Press* that these dogs were to be sold by Messrs Curtis & Company on a certain date at their 'godowns' in Commercial Square. In every clubroom the possibilities of the sale were discussed, and on the appointed day many of the young men of the city who were interested in dogs and sport put in an appearance at the auctioneers' salerooms. The dogs, mainly fox terriers, proved to be as fine a lot as one would see anywhere outside a show-ring, and were sold at very good prices, some to the officers of regiments then quartered at Singapore, others to civilians living in the city or in the neighbourhood. Thus in two or three days the consignment was practically scattered all over the island.

Some weeks passed, and in the meantime the *Coblentz* completed her voyage to Hong-kong and Shanghai, passed Singapore on her return journey, and was well on the way home, when it became known that one of the dogs in the consignment had suddenly gone mad and bitten a horse and a cat. This report was quickly followed by others of a similar kind, till very soon it became manifest that most of the dogs that had formed the deck cargo of the *Coblentz* were infected with rabies.

Previous to this there had been no authentic cases of rabies originating on the island of Singapore, which seems to prove that tropical heat does not produce rabies, and there were very few cases on record of the disease having been imported. The state of affairs soon afterwards can well be imagined. The disease spread

rapidly, first making its appearance in dogs introduced by Captain Schmidt. Many of these had changed owners, and by coming in contact with other dogs had spread the rabies broadcast. Several natives were bitten either by their own dogs or by pariahs which were running amuck. Before very long dog-owners, though loath to destroy their canine pets, began to regard them with suspicion.

One of the first Englishmen bitten was a young officer, Captain Fulton, of the regiment then quartered at Fort Canning. Fulton was playing with a small fox terrier he had bought at the Commercial Square sale, when suddenly the dog turned, snapping at him savagely, and before he could realise the danger it had bitten him through the hand. The animal then ran out of the messroom to the barrack-yard, snapping to right and left as it went. There it was finally surrounded and killed by the soldiers of the garrison.

This was about the fourth case of rabies; and, fearing the consequences of the bite, Fulton at once placed himself under medical treatment. On his hearing subsequently that the scourge was increasing, the matter preyed upon his mind to such an extent that the regimental doctor attending him finally advised him to take a sea voyage. Fulton at once obtained leave, and took the next P. & O. mail-boat to Japan, where he spent several weeks.

On the day of his return several of his friends went down to the P. & O. wharf to meet the boat. Not seeing Fulton on deck, they made inquiries of the captain, and were told that the young officer was very ill. When, a few minutes later, they were allowed by the ship's doctor to enter Fulton's cabin, the sight that met their eyes was one not to be readily forgotten, as they were just in time to see the unfortunate man pass away in the agonising throes of hydrophobia. Fulton, who had been perfectly well during his visit to Japan, joined the boat at Yokohama, and it was only during the ten days' voyage down to Singapore that the dreaded disease had shown itself.

The news of this sad event was received at Singapore with deep regret. The young officer was well known and well liked, and the rabies epidemic was now almost the sole topic in club and messroom. Other cases of hydrophobia were reported. One day a dog ran down Kallang Road, biting a horse on the way, and entered the gasworks-yard at Rochore. Here it was surrounded by a mob of yelling house-boys, who finally got the brute into a corner, where one of them impaled it with a native spear taken from the dining-room wall of the manager's house. Incidents of this sort happened almost daily in various parts of the city and suburbs.

Dog-killing was now carried on with greater zeal than ever. In addition to the municipal

dog-killers, who only caught dogs within the city limits, the Government instituted a new department, and a number of men under a competent European were brought into service as dog-killers. These men, armed with shot-guns charged with buckshot, scoured the island outside the municipal limits, killing almost every dog they saw at large. Many of the Chinese squatters, who grew vegetables in the country districts for the Singapore market, kept large numbers of dogs; but within a week or two this number was considerably reduced.

In the city the dog-killers were at work daily. False alarms were by no means uncommon. Indeed, the cry, '*Anjing gela!*' ('Mad dog!') was often to be heard in the streets. So great was the vigilance of the authorities, however, that most of the dogs that became infected were killed before they had time to do harm.

The fact that within the month succeeding the death of Captain Fulton between three and four thousand dogs were destroyed gives some idea of the magnitude of the scourge. So far as is known, all the dogs that formed the *Coblentz* consignment were killed, whether they showed signs of rabies or not, owners willingly sacrificing them in order to stamp out the disease; while a very small proportion of the pariah dogs escaped the vigilance of the Government employes. Several deaths from hydrophobia occurred among the native and the Eurasian population.

Previously it had not been necessary to obtain a license (costing one dollar) to keep a dog; but this was now compulsory both within and beyond the municipal boundaries. Further, every dog had to be equipped with a collar bearing a small brass badge with the number of its license thereon. This bylaw helped greatly in clearing off the superfluous dogs, as the natives, rather than pay a dollar per dog, now began to kill off the pups.

By the end of June there were very few dogs left, and the disease appeared to be completely stamped out. All the remaining pariahs were destroyed during the one or two succeeding months, and for many years no further cases of rabies were reported.

In the meantime the whole truth regarding the consignment brought by Captain Schmidt became known. It appeared that Schmidt and his chief officer, while their ship was being refitted, had spent their leisure time in London going round to the various dogs' homes and buying up all the good-looking and saleable animals; and during the voyage the dogs were cared for by the chief officer, who was going shares with the captain in the speculation. All this was thoroughly legitimate; the illegitimate part of the proceedings began when, finding that they had rabies among the eighty odd dogs on board, Captain Schmidt and his partner

did not at once destroy the whole consignment, but decided to hush the matter up and sell out at the earliest opportunity.

Captain Schmidt never dared to show his face

in Singapore again; and about two years later he and his chief officer went down with their boat, which seemed to the people of Singapore to be an occurrence approaching poetic justice.

WAR BENEATH THE WAVES.

SUBMARINES.

By W. O. HORSNAILL, A.M.I.Mech.E., A.M.I.E.E.

ALTHOUGH a limited number of submarines were used in the Russo-Japanese war and during the more recent fighting between Italy and Turkey, they were of a type which is now considered obsolete, and it is only within the last few months that the perfected modern submarine has been able to show its capabilities.

We shall know a great deal more about the effectiveness of these underwater craft before the end of the war, but up to the time of writing they have not done the execution expected of them. Before hostilities began some experts were of opinion that battleships would prove sufficiently vulnerable to the attacks of submarines to render them obsolete within a few years, and that all naval warfare would in future be conducted under the water or in the air. This view has not been justified up to the present; and when we consider that hundreds of our warships have been exposed for months to the attacks of hostile submarines with only a very small percentage of casualties, it would seem necessary vastly to improve submersible vessels before they can hold their own against fighting-ships on the surface.

It is, of course, exceedingly important that the details of our latest submarines should not become known to our enemies; hence every one engaged in the construction or handling of these craft is sworn to secrecy. Many interesting features are, however, common to nearly all submarines, and the description of them given below should enable the reader to form a good idea of the way they carry out their deadly work.

The submarine is much older than many people imagine, a vessel of this type having been successfully used during the American Civil War. In that instance the explosive charge was carried on a long spar in front of a wooden submarine propelled by hand-power, and the blowing up of a hostile vessel involved almost certain death to the heroic crew. The first really successful submarine was designed by Holland in America about forty years ago.

The difficulties to be overcome in building a vessel which can travel under water for several hours at a stretch are very considerable. It is, of course, easy enough to make a cigar-shaped hull which can be sunk by letting in water, and raised to the surface again by pumping it out. Neither is there any difficulty in propelling such a craft by an oil-engine on the surface and by

an electric motor when submerged. The main problems which early inventors had to contend with were keeping the vessel level when under water, providing a sufficient supply of fresh air, being able to see without coming to the surface, and preserving a constant depth.

Keeping a vessel level when submerged is no easy matter, and several of the early submarines were lost by going head-first to the bottom. In a boat on the surface, if a weight is moved from one place to another, the only effect is to make the boat float a little to one side or down at one end. Even one man moving from the bow to the stern of a large submarine at rest below the surface might make her stern go down until she floated vertically instead of horizontally. This feature is of the utmost importance, as unless it was counteracted the crew could not move about, and the firing of a heavy torpedo from one end would completely upset the balance. The difficulty has been overcome by automatic apparatus which transfers water quickly from one end to the other of a submarine when the balance is upset by movements of the crew or heavy articles such as torpedoes. No details of this apparatus are available; but in all probability it is controlled by either a pendulum or some form of spinning-top. For example, a heavy pendulum might have an electrical connection on each side of it, with just room between for it to hang clear without touching either when the vessel was exactly level. If the bow went down the pendulum would touch one of the connections and send an electric current through a small motor, making it run in a certain direction. Similarly, a sinking of the stern would bring the other connection up against the pendulum, thus causing the motor to run the opposite way. Now, suppose we have a tank half-full of water at each end of the submarine, with a pipe between the two. Our motor could be made to admit air at a high pressure to the bow or the stern tank according to which way it ran, and this air would force the water from one end to the other, thus keeping the vessel exactly horizontal. When *moving* under water a submarine can also be kept level by the horizontal rudders provided at the bow and stern.

In the earliest submarines the atmosphere was replenished by chemical means; but in all existing craft fresh air is carried in reservoirs at a very high pressure, whereby a large

volume occupies only a small space. This compressed air is allowed gradually to escape, while the foul air is pumped out at the top, and forms the train of bubbles given off by all submarines.

The periscope enables those inside a submarine to obtain a view all round at the surface when the vessel is completely submerged. This instrument consists of a tube about six inches in diameter which stands up some twelve to fifteen feet above the conning-tower. At the top is a lens and a prism which project the view down the tube to the observer below. Every new submarine is fitted with at least two periscopes, having field-glasses at the bottom to magnify the view. The lens at the top gives a view over a wide angle, and can be revolved to point in any direction.

So long as the periscopes are out of the water a submarine can be safely navigated by sight; but in warfare it is often necessary to submerge them when approaching an enemy's fleet. In such cases the submarine is steered by compass for direction, while another instrument shows the distance run; hence it is quite easy to come up at any predetermined position. In the meantime, however, vessels in sight before the submarine dived may have altered their positions, and other vessels may have arrived; therefore, when she is coming to the surface there is always the possibility of a collision. In fact, this form of disaster has actually taken place. If not already done, there is little doubt that some instrument will be devised to indicate, inside a submarine, the near presence of other vessels when her periscopes are submerged.

As regards keeping at a constant depth, this is done by the horizontal rudders already referred to, in conjunction with a gauge which shows the number of feet below the surface.

Until the advent of the gyroscopic compass, steering offered some difficulty, as the magnetic compass was seriously affected by the powerful electrical machinery for propelling the submarine under water. The gyroscopic compass is based on the tendency of a spinning wheel to place its axis in line with that of the earth, and therefore to point to the true north. This instrument is not affected by either electricity or masses of iron, and it is now almost exclusively used in warships of all descriptions.

British submarines are propelled by Diesel engines which are worked by the cheap residue oils left after distilling off the petrol, paraffin, and other lighter products from crude petroleum. Many French submarines are fitted with steam-turbines. In either case these methods of propulsion are only used on the surface, as under water it would be difficult to get rid of the exhaust gases from the oil-engines or from the liquid-fuel burners under the boilers. Hence electric motors are used for driving the propellers when submerged. These motors are mounted on the shafts between the engines and the pro-

pellers, and they are supplied with electricity from large storage-batteries arranged under the floors. Before taking electric current out of a battery, however, it must first be put in, and this is done on the surface by the motors themselves, which are made to generate electricity whilst being run by the engines. All modern submarines have twin screws driven by separate engines or motors, and there are clutches to uncouple the engines from the motors when running under water. This description of the propelling machinery may seem complex, but really the engines, electric motors, and storage-battery form a combination of common appliances which have long since proved their reliability.

In addition to keeping up the supply of fresh air in a submarine when under water, and adjusting the balance, compressed air is used for starting the oil-engines and firing the torpedoes, air-reservoirs being placed in various positions for these purposes. Two air-compressors, usually driven by electric motors, are installed for charging the reservoirs.

In the larger submarines two torpedo-tubes are fixed at each end, and four spare torpedoes are carried, making eight altogether with those ready in the tubes. This number is by no means excessive, as, owing to the difficulty of aiming a submarine for firing, many torpedoes miss their mark.

Electricity is used for working the pumps and rudders, for lighting, and for cooking and heating, as stoves would, of course, vitiate the atmosphere when the submarine was submerged. It may be remarked here that it is no longer necessary to carry white mice to give warning by their behaviour when the air is becoming dangerously charged with petrol-vapour, as petrol-motors are no longer used.

A submarine has a cigar-shaped circular body, with a raised portion along the top which forms a platform. In the middle of this platform is an armoured conning-tower, with observation windows in it. The top of the conning-tower is fitted with a steering-wheel, and forms the control position for cruising on the surface when the vessel is not under fire. The crew enter or leave through a watertight door on the top of the conning-tower, and as an additional safeguard there is a second watertight door into the body of the vessel.

The size of submarines is continually increasing, and the larger ones now in service measure nearly one hundred and eighty feet in length by about twenty-three feet in diameter, while the weight is over eight hundred tons. These are roughly the dimensions of the British E Class, and they have engines of one thousand seven hundred horse-power, which gives them a speed of sixteen knots, or eighteen and a half miles an hour, on the surface. The electric motors develop about six hundred horse-power, and drive the vessel at about eleven knots when submerged; while the battery holds enough current to propel the sub-

marine under water for seventy miles. On the surface a submarine of this class is capable of cruising for four thousand miles without putting into port for a fresh supply of oil.

Submarines can dive safely to a depth of a hundred feet; but unless it is necessary to avoid mines near the surface, they usually proceed under water either with the periscopes exposed or only a few feet submerged. Under the latter condition the E Class cannot be safely manoeuvred in less than fifty feet of water.

When making long cruises a submarine runs on the surface whenever there are no hostile warships in sight, and at night, when she cannot be seen, as surface cruising uses up less oil for the distance traversed, and a higher speed can be maintained than when running submerged.

When the submarine is making a voyage on the surface the ballast-tanks are empty and part of the circular hull is above the water. In this 'light' condition, as it is called, the vessel is steered and controlled from the top of the conning-tower, and in fine weather the crew can walk about on the platform. With hostile craft in sight water is pumped into the tanks and the hull sinks until the platform is level with the sea. Under this 'awash' condition the officer in charge manoeuvres the ship from inside the conning-tower, and the submarine is ready to dive at any moment by simply turning the horizontal rudders downwards. The vessel is kept at any desired depth below the surface by the rudders, or brought up again by the same means. It will be noted that water is *pumped* into the ballast-tanks and not merely *let in* from the sea when the ship is sinking to the 'awash' condition. This plan compresses the air in the tanks, which is thus left ready to blow the water out again for rising to the 'light' condition. Of course, to keep submerged without moving, more water must be pumped in, but only a small quantity, as a very little extra weight will sink a submarine when 'awash.'

The tendency is at present toward the building of larger and more powerful submarines, the latest French examples being approximately two hundred and fifty feet in length, with engines of nearly five thousand horse-power. Some of these vessels are probably now in service. The Germans also are building larger submarines, which are said to be two hundred and fifteen feet long, with four thousand horse-power. There is good reason to believe that recently launched British craft are fully equal in size and power to these French and German vessels, but great secrecy is preserved regarding their dimensions and capabilities. The speeds have also been increased to over twenty knots, or twenty-three miles an hour, on the surface.

Although the main function of a submarine is to fire torpedoes at hostile warships, twelve to twenty-four pounder disappearing guns have been installed in many of these craft. These

guns will probably increase in calibre with the size of the vessels, and it is reported that six-inch guns have already been fitted to a British submarine.

No warship of any description is now considered complete without a wireless installation, and the larger submarines are fitted with the necessary equipment for sending and receiving messages.

In the earlier and smaller submarines the accommodation for the crew offered little comfort, but at that time only short trips were attempted. The thirty or more men who form the crew of a large modern submarine have quarters in which they can sleep and eat comfortably for many days at a time.

Provision, in the form of air-traps and breathing-helmets, is now made for saving the crew of a submarine which has been sunk by collision. The air-traps are formed by vertical partitions at the sides near the conning-tower, and they act on the principle of a diving-bell. There is room on either side to accommodate the whole of the crew, with their heads well clear of the water. This arrangement gives time for each man to put on a species of diving-helmet and watertight jacket in which chemicals are provided for purifying the breath. A man can live under water in one of these escape helmets for nearly two hours, which gives him ample time to get out of the submarine and float to the surface. On coming up he can blow out part of the jacket, and thus obtain enough buoyancy to open the glass sight-door in front of the helmet, when he is able to breathe fresh air and to keep afloat until rescued.

The submarine has fully demonstrated its value both for attacking hostile craft and for making observations off an enemy's coast; hence these vessels are likely in future to form a permanent feature of all navies. To what extent the size will be increased it is not easy to foretell; but obviously, unless their shape is modified, the use of very large submarines would be limited, owing to the great depth of water needed for complete submergence.

A SONG.

THE Spirit of the Mountain,
He hath spoken unto me
When the mist is on the water
Of the loch beside the sea.
I have lain within the shelter
Of a little hazel-tree,
I have heard him talking slowly
To the Spirit of the Sea.

I have seen a figure moving
Through the mist upon the lake,
When the winter day was breaking
And the birds were scarce awake.
'Twas the great soul of my father,
I have heard him pray for me
To the Mighty of the Mountain
And the Spirit of the Sea.

ALLAN G. BEE.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

ONE day of late, when I was among the books of an old home in the North, a new obligation was suggested, as happens continually to all who stay to think and wonder in such times of trembling circumstance. There are new hindrances to life and contentment, new necessities to conscience, duties to self, to people, and to country. Those who fearfully suggested that when the war is over life would not be the same again were a trifle timid in their prophecy, too distant in their period of change, for life is already different. The sunny summer of yester-year seems so soon to have belonged to halcyon days of a past so far remote and nearly incomprehensible to those in this desperate struggle for light and life, that it might have had the kind ladies and knights of romance or the sprites of fairyland for actors in it. But better times than these will come for the conscience and the spirit. On a shelf was a large and well-remembered book, a paternal possession of the mid-Victorian times, one odd volume of *Chambers's Journal*, which happened to be the first thing of its kind I ever read; and now one turned over its pages again for the good memories that they stirred. There are no such remembrances of the spirit and freshness of earliest youth as the first books one read for recreation. Hardly another story has created in my mind such a real, living, and lasting atmosphere as one in this old volume, a romance of the backwoods of America, with a sweet Cora for heroine, great adventures, Red Indians, repulsive Mormons, strife, and suffering, and happiness. But, apart from the story, and in no obtrusive or even intentional way, such old volumes of periodicals as these necessarily convey a fine impression of the thoughts and feelings and even appearances of the times in which they were printed. It is inevitable, and that is the historical value of the journal and the magazine. So, in many ways, the sentiments and the aspirations of those happy mid-Victorians may often be gathered from these leaves far better than from any other medium meant to be more direct in teaching. They create the atmosphere, make you feel, present the under-surface to your inspection, and you nearly understand. There is no better night's entertainment now than to look through such pages and those of

the old illustrated London weeklies of round about fifty years ago, see how they regarded their battles then, how they celebrated their peace, what was the spirit of the Empire just as it was rising to its supreme greatness. Some day, far ahead, the people who follow us, enjoying—let us believe—the most perfect peace and happiness, and still most fervently prosecuting those ideals for the preservation of which Britain and her friends are bleeding now, will look back and most surely inquire and wonder about the thoughts and feelings of their ancestors—ourselves—who paid the price of freedom as it had never been paid before. There will be mountains and mountains of newspapers and periodicals for them to look upon and read; but few of them, with their soldiers' letters and their official reports and their observations of governmental eye-witnesses, will tell anything to posterity of the real story and the *feeling* of this tremendous period. All the histories which are being written now and which will be written afterwards will likewise fail. It is all too great, and it is one of the minor tragedies of this cataclysm that those who follow in the world long after can never really understand. How shall they when even now we ourselves only just begin to see and feel? Now London, for example, may look less concerned than any other of the capitals of the Allies, but in reality it is the most concerned. On London, meaning the heart of the British Empire, depends the result of this war as it depends on neither Paris, Petrograd, Brussels, nor any other chief city. But to the eyes of the casual stranger London is hardly different in daylight now from what it is in times of peace. It is perhaps a little more serious; there is less display of self-indulgence in any form, no gaiety or mirth. At night it is sombre, gloomy on the whole; but bright spots may still be found. In details London is much changed even on the surface; but it matters little. In thought and disposition, and in mode of feeling, it is changed very much indeed; and what has happened in the war-days in these respects will, one imagines, have some permanent effect on the life of the town. To make a revolutionary change in the manner of life of London within the space of a very few months is a marvellous, an almost

unbelievable thing. Perhaps nothing less overwhelming than a war of the world could have done it, and it is one of the most wonderful results of this war that, for the chief example, London has discovered that it has a hearth, a fireside. It begins to seem that those words which were the burden of the song of the royalists in the French Revolution—you will recall them: '*Où peut-on être mieux qu'au sein de sa famille?*'—might almost be adopted for the new motto of the restless metropolitan as he was. This change is remarkable; and yet, though we feel the effects of it every minute of our lives in town, and may always do so, it is not being described in either letters or pictures for the benefit of posterity. Perhaps it will be overlooked. The crowds, the meetings, the recruitings, the marchings of the soldiers, the arrival of the wounded, the eventual rejoicings—such will all be well treated and recorded; but, after all, these are ephemeral matters. They are mere acts which fade away as thoughts and feelings are taking permanent root, yet in their way they are interesting. Thinking of that old volume on the shelf, I should like to state a few impressions of the capital at the time of the greatest upheaval that the world has known. With, as I have said, no great and very obvious changes on the surface that a stranger might discover at once, they need sometimes to be searched for. London has done its best to live on as usual, and has done it well. There is no commotion, no apparent distress, hardly any sense of shock. It might have been better had there been a little more.

* * *

Yet the Londoner turned his head one day when there strode slowly and deliberately down the south side of the Strand the strange but engrossing figure of a man who had something of the look about him of a human empire. He came out from one of the big hotels with that manner of right and self-possession that only the colonial can master to perfection. Big and burly, he had a round, red, clean-shaven face. He wore corduroy breeches, with shining leggings and the most glittering spurs. He had a black shirt, and a kind of knotted scarf about his neck, and on his head was a wide soft hat. He wore neither vest nor jacket—or tunic, as one should say; but this strong colonial study in amber and black walked out into the Strand and up and down the Strand, and through the noble Square, and along, with his hands in his breeches-pockets at the front, thumbs out, thinking much, glancing here and there, and caring for—quite respectfully—nothing and nobody. This sight came before me in the last days of October or the beginning of November, and I think that splendid fellow, such a man of head and heart and limb, was the first colonial soldier that I saw in the Motherland. He had

come up from the middle of some far somewhere, one of those lusty pioneers at the outposts of the Empire; and one could not only admire him and his like, but bless them for their magnificent sturdy independence. We are less conventional in London than we used to be. The frock-coats have gone; silk hats are fewer; there is less regard always for what is quite exact and 'proper'; but this jacketless, black-shirted colonial soldier, pacing down the Strand at the beginning of the winter, was a most unfamiliar sight. It told us that they were coming, and had come, the men from the far corners who had been doing their own work quietly all the time, and seeming not to bother. Really now they had come; they had arrived. They walked down the Strand with their jackets off, and they were ready. That was the first real impression one gained of a change coming over the surface of London. Next day again I saw a cavalryman riding at a trot along the Strand. Truly it were better that a cavalryman should ride on his horse than take a taxicab, and there was no reason why he should not trot down the Strand and up Ludgate Hill and along Cheapside if he wished to reach the big railway station at Liverpool Street; but this again was a most unusual thing, and we turned our heads to look at it. Except he were a mounted policeman, it has been as common for any man in any capacity to go a-riding horseback down the Strand as for a huntsman in scarlet coat to gallop along there screaming 'Tally-ho!' but not more so. Now we become accustomed to these things and their like. We paid no heed yesterday when we saw an armoured motor-car, a strange drab thing, boxed up, with no driver visible, but the long, intimidating snout of a gun poking out from its forward parts, tearing down the Mall at the top of its speed as if it would shoot at Buckingham Palace before the end of the world should come.

* * *

These, indeed, are small details, and thousands and thousands of them only make up that little change which is apparent on the surface of the town. When before—and in the winter, too—did the military bands play every day in our great Trafalgar Square? Young men in London can still remember when we and the French did not love each other, and, for our part, we were not much pleased on hearing two people speaking French as they passed us by; yet now there are many important parts of London, inside and outside, where as much of it is heard as English, and there are restaurants in the most public places where it is the more extensive. The ordinary Londoner, the worst linguist in any capital in the world, is beginning to pick up a few phrases of French, and thinks he may acquire some more. In the streets they are selling *Le Cri de Londres*, *L'Indépendance Belge*, and other newspapers

with foreign titles; we see evidences of France and Belgium everywhere, and only one evidence still remaining of false Germany—a direction in three languages at the entrance to Charing Cross Station. These French and Belgians for the most part seem happy people; the Belgians, at any rate, though they have lost so much, have achieved a great deliverance and a comfortable sanctuary. There have been sorrow and sadness in London since the war began—so much of it; but for the most part the suffering has been hidden from the public view. If we have seen the wounded come in at Waterloo Station, they have—O you rare beggars of British soldiers!—usually been laughing and smoking cigarettes. But a little while since there were the most poignant scenes to be witnessed at Charing Cross and Victoria when the Continental trains arrived and brought with them every afternoon and night great loads of these miserable Belgian refugees. Once or twice, from the window of a restaurant overlooking the platforms of Victoria Station, I watched them come at night, and ask now to be spared from any more sorrowful sight, anything more intensely, sadly pathetic, than that of the little Belgian children clinging to mothers who bore in their arms bundles of oddments wrapped in cotton sheets—all that was left of the Belgian home! And the little ones smiled and did not understand. Motherhood and childhood, and the home that is lost—that is the world; but there is something of heaven in it also, and all heaven in the sweet innocence of these smiling babes.

* * *

Soldiers, soldiers, soldiers everywhere! They are marching through the streets continually, with their bands playing, their pipers skirling, their faces smiling. But the soldiered streets seem almost to have become normal London; nor do big guns in places that were gunless attract attention now. The town wishes to be as normal as it can. At the beginning of the war the people talked excitedly for a while; and still they speak of nothing but the war, and daily ask each other the futile question, 'How long will it last—how long?' We have more nights of war-talk in this town than anywhere else in the world; only when we go into the country do we discover among the people the capacity for discussion of other things. Little wonder, then, that when the Londoner, after dinner and talk with a table of pessimists, goes home through darkened streets, passes the tower of St Stephen's (whose clock-face now is for the first time unlighted, whose Big Ben is utterly silent), and is sometimes nearly destroyed by black omnibuses that hurtle up from the darkness and vanish again—as torpedoes might pass in the night—I say we should not wonder if this Londoner sometimes dreams that there is a mine beneath his bolster and a Zeppelin over-

head. But he wakes well, and is a cheery soul. We did not like these darkened streets at first; and if, among the many reasons that have been given as to why the lights have been masked or extinguished everywhere, the true one is not to give an indication of the whereabouts of the greatest city to its flying enemy, we like them still less. When before was London afraid? Paris has not been afraid, nor even Berlin. And really London is not at all afraid. If it were a matter of that, its people would blaze away every unit of their electricity at night, and use fireworks for a finish. I beg of posterity that it will never believe that London was afraid. Yet, if we pass this sentiment, let it be said that some who have become accustomed to it, and whose nerves are unaffected, find some satisfaction and even beauty in this darkened London. As a lighted town it was at its artistic best in the past days of the yellow gas, or perhaps those others we did not know when lanthorns and candles made the illumination. Then there was softness. The night soothed. Modern London in peace is a harsh, a terrible glare, and, with its sky-signs, a jumpy, streaky nightmare when the sun has gone. This new war-gloom is two or three shades too deep, but otherwise it gives us fine nocturnal effects; and the nocturnes of London are, or could be, equal to those of any other cities. You recall the ineffable grandeur of the Colosseum at Rome on a moonlight night. It is less than a year since I sat among these ancient stones and listened to the story they faintly whispered from the ages of the dazzling imperial shows—and the horrors of their combats—and it is an experience that strikes sharp upon the mind. But lately, in the last days in London for a time, I have been walking home at nights down Whitehall way and past our splendid piles at Westminster. This, on a fine night, when a moon is gliding in the heavens, makes a nocturne of unequalled grandeur that no man of thought and feeling may contemplate without emotion. Then the black mass and delicate outline of the Palace of Westminster, cut out clean against the indigo with the silvery edge that Phœbe paints, is, in its cold beauty and its suggestion of an immensity of strength, a midnight sight that makes its mark upon the soul. Here is the Mother of Parliaments; here is the life-centre of the glorious British Empire. Then pass by the Abbey, into which many thousands of Londoners, moved by some strange impulse, have lately been where they had never been before. Beloved Abbey! Those who have looked and lingered in admiration in the aisles and chapels of Continental cathedrals have seen nothing in its way so rare, nothing so great, as the Abbey of our nation. See, when you enter from the east, how it is jumbled up with the monuments of the great, how tightly packed it is, how in a certain careless simplicity, almost a studied disorder, it does

suggest the rude strength of our island home and the greatness of the British spirit! Here the kings are crowned; here they lie asleep for ever, with their spirits brooding still over the England that they made. Here among them all is Henry the Fifth ('Cry God for Harry! England! and Saint George!'), the spiritfult soldier-king, and high above his tomb are his helmet, his shield, and his horse's saddle. His spirit may rest in peace. England, as ever, does nobly still, does well. Here lie the admirals of the seas; here are the bodies of the generals resting, the great statesmen, the writers, the artists, the makers of England. What a casket of imperial jewels, made of hearts and blood, is this Abbey of Westminster!

* * *

More than a thousand other little tales could still be told of London now, but the war would be done and the bells in London steeples would be ringing for the peace if all the changes on the surface were to be listed; and as for the changes in the thoughts and feelings—that new love for the fireside and the hearth and home, that kindling of friendship, which is the greatest of all the changes—one may write of these again. All these have been solemn words; and, oh, solemnity! we shall tire of you in town by the time the battles end! Even as it is, one must finish now upon a lighter theme. It is known that the fourth and fifth classes of Londoners—or it may be the sixth and seventh—with all their knowledge and alertness, find continually that life presses so hardly, even in times of peace, so much harasses the mind, makes an inclination for the nerves to tremble, that some nearly blank relief is needed, some very simple change, some distraction most elementary. Let us suggest and believe that this is why, if you and I should suddenly stand still and look

up at nothing in the sky, there would soon be a dozen or more around us looking upward too. A fallen horse will gather a greater company of sympathetic spectators in London than anywhere else in all the world. It is an attraction that never fails in town. And as for the crush to look at nothing, or what is not known to be anything, surely this is intelligible; for is not this a mystery, and what is there better to feed curiosity than a mystery, its most natural food? In such matters as this man is simple and intensely human, just as a little child. He likes to look. The other day, when turning from the Strand down a side-street leading to the Adelphi, I saw a group of Londoners of many kinds gathered together. They were mostly young or middle-aged men, respectable of appearance; some were children. There were some soldiers too. The hour was noon, and the day was fine. Why were these good people assembled, and how were they so well entertained? Punch and Judy! A one-man travelling show of the oldest kind was here presenting a performance of the famous and cruel tragedy at the corner of the Strand, with all the effects and all the thrills with which it had been exhibited to the children of many generations. The barbarian Punch, singing his madman's song, belaboured the unoffending Judy as before, Toby the dog saw much and said little, murder was done, justice was established, Ketch the hangman came and hanged that rascal Punch, and then the watchers dropped a few pennies into a little can. Within a yard or two there was the swirl of London traffic along this mighty thoroughfare, and newsboys with placards of amber and green and white were shrieking out the tidings of the war, shouting to us that the Russians were pressing on and on, that the French were forcing through, that the British were sweeping all the seas and fighting well in Flanders.

THE BRIGHT EYES OF DANGER.

CHAPTER XIV.—IN WHICH I MEET THE 'SCOTTISH HORACE.'

THE lawyer led the way by a short cut among a warren of closes, coming out in Writers' Court, where his 'howff,' Lucky Clark's tavern, stood, evidently a thriving house of call, for the place hummed like a beehive.

'The usual, my lass,' he said to a wench who waited. He asked me what refreshment I favoured, and I told him that claret would be agreeable to me.

'No better to be had than where we are, but gie me a "cauld cock and feather." It lies warmer about my auld bones than the claret wine.'

The mysteriously named refection turned out to be a glass of brandy and a bunch of raisins. He applied himself to these with gusto, his talk

sprinkled with many an interruption of 'How d'ye do, sir?' for he was evidently a man of many acquaintances.

The seizure of the city was the topic of conversation uppermost; but I caught very little of the talk, for there was no disposition on the part of the 'douce' writers and burghers to advertise their opinions. They spoke in subdued voices in little groups of three or four together, with much discretion, knowing shakings of heads, and interchange of snuff-mulls. Mr Scott pointed out some of them to me whom he called 'k-nowledgeable' men. I remember the name of a Mr Charles Stewart, a writer, who he said knew a great deal concerning many undercurrents in Jacobite circles. 'A decent man,' he whispered,

hand to mouth, 'but sairly perplexed how to keep loyally to his clan name and at the same time his own reput' wi' the law officers o' the Crown and his Grace o' Argyll.'

He excused himself for a minute or two to speak with some friends, while I sat at the table marshalling my thoughts, trying vainly to piece together some solution of my adventures at The Garth. Would it not be better, I speculated, to settle my business with Mr Scott and ride home to the quiet hills, better to banish the thoughts that continually assailed and baffled me? But even as I strove to do so there rose clear before me the vision of the blind man at The Garth and the girl when last I saw her demanding my 'confession.' I wondered if she had read it. If ever I saw Mistress Charlotte again, would she deign to give me as much as a glance? My heart sank at the thought. Yet there must be some way whereby I could clear myself in her eyes, and I swore for the hundredth time that I would find it.

It was on the tip of my tongue to tell Mr Scott my adventures, and rely on his sense and knowledge to throw some light on them; but at the moment a little, squat man came in. He walked briskly, with a thought of mincing in his gait, and seemed on the greatest good terms with himself.

'Here is denty Allan himsel'!' quoth Mr Scott; and aloud to the new-comer, 'Man, ye look the younger the aulder ye get, Allan. Is it the last week's work that has heartened ye? I'll warrant it. Come, sit ye down, and join us in a whet.'

'Blithely, Peter! blithely!' said the little man.

Mr Scott presented me. 'Mr Edward Layton from Westmorland, with good Border Scots blood in him. His mother was an Elliot of Darehope.—This is Master Allan Ramsay, whose famous name I make no doubt is fameeliar to you.' He gave me a nudge that conveyed much.

I am no great reader of verse; but by good fortune, when at Darehope on my way north, I chanced on a copy of *The Gentle Shepherd*, and had beguiled the evenings with it.

'It is indeed an honour to meet the "Scottish Horace,"' I said, as politely as I could, and bowed to the little man. My legal friend, I thought, breathed more freely, and beamed on us both. It appeared that the poet was never averse from adulation.

'Hoot, toot, sir, ye flatter me!' said he. 'But I am sensible of your kindness. Mr Pope, maybe, or Mr Gay, I might company; but when it comes to Horace! Hoot, toot, sir!'

He shook a protesting pinch of snuff in the air; but I believe had I put him beside Will Shakespeare he would have taken it with equanimity and as sober truth.

'Ye have come to Edinburgh at a stirring

time, young sir. The auld Stuarts back again!' His eye kindled. 'My faith, Peter! did I no' tell ye the day would come?'

'Ye did that same, Allan—frequently, Allan! frequently!'

'And here it is! Recruits for the Chevalier coming in every day! Word o' a French fleet getting ready!' He lowered his voice, and mentioned to us various great names whose bearers he said were *coming out* for the Prince.

'We'll see *the Act* repealed yet, Peter. Fine I ken that ye are a Whig; but ye'll be fain to admit that the turn o' the tide is with the White Rose.'

'Um—I'm no' so sure o' that. By the way, I didna see ye at the Proclamation o' King James at the Cross,' quoth Mr Scott, a twinkle in his eye, and with the very swiftest suggestion of a glance in my direction.

'Ah, Peter, man! we are auld cronies, and ye maun have your jest. Young bloods like our friend here can throw their bonnets in the air; but I'm auld now, and there are other weighty reasons that interdict me. Ye understand, Peter?' He nodded his head portentously.

'Fine, Allan!'

There was a pause.

Allan Ramsay passed his glass over the water-carafe and drank without words the toast of 'The King o'er the water.' 'Ay, there are mony considerations,' said he, as he put the empty glass down. 'Gin he were younger by thirty year, Allan Ramsay would never be a chimney-keeper if the Prince or His Majesty his father waved a hand for him.'

My friend Scott's face was a study in grave and sympathetic interest; but when the little poet bent his head over his dram he had given me the tiniest droop of an eyelid.

'I ken all ye say is true, Allan; but Mr Layton has as much notion of helping the Chevalier as I have, and that, as ye ken, is dooms little. So we'll thole each other's politics (that should never come atween friends); and ye'll no' forget ye sup at my house to-night. Just now, I'll haste me back to my desk, for I have my kale at twa, and I have a couple o' pleas to straucht out before that.'

He and I gave Mr Allan Ramsay good-day. The man of law laid an approving hand on my shoulder.

'Ye kittled him the right way about his lesterary powers. I am rejoiced to observe, Mr Layton, that you have some ideas o' a little judeecious flattery.'

'That is precisely what I do not possess, but you gave me a nudge that I could scarce misunderstand.'

'Well, I think ye pleased him,' he laughed. 'You and your "Scottish Horace"! And, indeed, the singular and fortunate thing was that I had made a friend of the little man, and he was to show this on a very unexpected occasion.'

'He is a fine bit creature, Allan, though he havers a lot o' wearyfu' nonsense about considerations keepin' him from public profession o' his being a Jacobite. He is a client o' mine; and the fact is, he has a thrivin' trade at wig-makin', and though he counts himsel' a hantle above the business, he would be sweirt to lose a patron through the White Cockade, for he's no' like most o' the feckless kind that write poetry. Na, na! Allan kens baith sides o' a saxeption. But a fine mannie, and a great service in many ways he has been to the town.'

He enlarged on the little poet's kind heart, his public spirit, his circulating library, his musical and theatrical tastes, and what not, until we came near the 'White Horse,' when we parted.

I made my way to my quarters and inquired for Walter Irving. He had left a message that he had gone to see friends, and would in all likelihood come back that night. The house was full of people, and in the courtyard men and horses were coming and going. Stable-boys shouted and swore, the ring of hoofs came from the stables, house wenches clattered upstairs and downstairs with dishes, and caddies ran with messages or hung about the kitchen daffing, melting their fees into small ale, and keeping up a babel of talk not of the politest. Presently another rider arrived on a steaming horse. He showed much excitement, so I went outside and gathered the news. He was a farmer in the Lothian, and had ridden hard with the news that Sir John Cope's ships were in the Firth, and by this time his army would be landing at the port of Dunbar. Others came hot-foot after him, decent-looking country people, in manifest concern about the troublous state of affairs, all with the same tidings, and all on nettles (as the saying goes) as to what would happen next. All that afternoon a tide of people flowed into Edinburgh, swelling the press of people in the streets, and as the day went on the rumours hardened into first-hand evidence. Cope's army was landing at Dunbar!

There came a burst of rain later that cleared the streets somewhat, but it filled the inns with gossips and shelter-seekers. I was fain to avoid the bustle in the house, and retired to my room, where I sat and smoked, alone with my thoughts. These ran continually on my adventures at The Garth. I had left my *Virgil* with my other papers with the lawyer for safety, but the copy of the secret paper I knew by heart. It danced before my tired eyes without further result than an access of irritation. There was little purpose in this, and being (as I think) a man not given to idle speculation, I called for writing materials, and bent my thoughts on a letter to friends in Westmorland, telling them of Charles Edward's capture of the city, and striving to keep my mind round practical matters, instead of ranging round theories and fruitless fancies, including a pair of hazel eyes. This done, I went out and walked briskly for an hour, and came back when it was striking six o'clock by the Tron.

Irving's broad blue bonnet and overcoat were lying where he had thrown them on a bench in the corridor; but I could not find him, until the landlord led me to a room and pointed to the closed door. 'They are at the cartes,' said he.

I opened the door and went in. The room was the best in the hostelry, though this was not to say a great deal. Ill-lighted by three or four candles, and barely furnished, a good blazing wood-fire went far to redeem its gauntness, for the evening was falling chilly. There were four men there, two of them standing. One of these was Walter Irving. I was about to greet him, when he held up a warning hand and pointed to the table where the other two were sitting at play. The three strangers were well-dressed, in perukes and knee-breeches; small-swords at their haunches; and in their hats, thrown carelessly down beside them, was mounted the White Cockade.

WAR BENEATH THE WAVES.

TORPEDOES.

By W. O. HORNSNAILL, A.M.I.Mech.E., A.M.I.E.E.

AN interesting feature of the present war is the great importance of the torpedo in naval fighting, now that it can be discharged at close range by the submarine. All kinds of warships are fitted with underwater torpedo-tubes; but the chances of getting close enough in the face of modern gun-fire effectively to discharge a torpedo are very remote—hence the use of this weapon will probably be confined to the submarine in future.

Torpedoes are really submarines in miniature without any crews, and they are much larger than many people imagine. The Whitehead torpedo now in general use measures over twenty feet in length, has a diameter of twenty-one inches, and weighs over a ton. A torpedo consists of a cigar-shaped steel shell, which contains an explosive charge, the machinery for propelling it through the water, and the automatic devices for directing its course towards

the vessel aimed at. Fired from a tube under water, it travels below the surface at a higher speed than the fastest warship afloat, or nearly fifty miles an hour, and it is effective up to a distance of five miles. Torpedoes are, however, seldom used at anything like their full range, as there is little chance of hitting a moving battleship at over, say, two thousand yards. Moreover, there is no need for a submarine to fire her torpedoes at long range, as she can creep up to within a few hundred yards of a hostile vessel, whose only means of defence is to manœuvre out of the way. Even at close range it is by no means easy to hit a vessel with a torpedo when she is moving fast through the water; hence in future most of the naval fighting will be done at full speed.

A torpedo is fired from a tube either by compressed air or by a charge of cordite; in fact, the torpedo-tube is practically a gun, but the small charge of explosive used is only just sufficient to give the torpedo a send off at its correct speed and in the right direction. These tubes were originally carried on deck in a species of gun-mounting, so that they could be aimed in any direction; but this plan has now been abandoned in favour of underwater tubes. Of course the latter cannot be swivelled, as in submarines they are built into the ship's plating; hence it is necessary to aim the whole vessel. This is done from the conning-tower, and the torpedo is fired by an electric switch at the right moment.

Coming to the actual details of the torpedo itself, we find the shell divided up into a number of compartments by steel divisions or 'bulkheads,' as is the case in an ordinary ship. The first compartment in the head of the torpedo is filled with about three hundredweight of gun-cotton or some other explosive. Right at the point a metal rod, known as the 'striker,' projects in front, and when the torpedo hits the side of a vessel this striker is forced inward on to the percussion-cap which explodes the gun-cotton. Without some safety device it would be very dangerous to handle a torpedo, as the striker might be inadvertently hit, and this danger is guarded against by a safety-pin right through the striker, which cannot be pushed inward until the pin is removed. This pin must, of course, be taken out when the torpedo is run into the tube for firing, and there is still some risk of the striker being forced 'home' by the concussion or by hitting some small object in the water close to the ship. To make certain that the charge shall not be accidentally exploded until the torpedo is some distance away, a nut with a very fine screw-thread is screwed on to the striker. This nut has little blades on it like a propeller, and as the torpedo rushes through the water these blades unscrew the nut and leave the striker free after a certain distance has been traversed.

After it leaves the tube the torpedo is propelled by a compressed-air engine of about one hundred horse-power. This engine turns two propellers in opposite directions, one being mounted direct on the engine-shaft, while the other is carried on a tube which slides over the shaft, this second propeller being driven through suitable gear which makes it turn the opposite way. These propellers are right- and left-handed—hence they both drive the torpedo forward; and the reason for this arrangement is that the two propellers may balance each other, and so have no tendency to revolve the torpedo, which would rotate if only one were used.

The compressed air for the engine is contained in a strong steel reservoir which takes up nearly half the length of the torpedo. This reservoir is charged by compressors in the ship to the enormous pressure of one thousand three hundred and fifty pounds to the square inch; and to guard against the risk of explosion it is periodically tested to a much higher pressure. Between the reservoir and the engine is a heating-chamber, where the air is heated by a burning spray of alcohol, the effect being to increase the volume and thus make the supply last much longer than if it were used cold. In this chamber is also a reducing-valve which automatically delivers the air to the engine at a pressure of about one hundred pounds to the square inch no matter what the pressure may be in the reservoir.

We have now explained how a torpedo is discharged and afterwards propelled on its errand of destruction; but we still have to provide for steering it on a straight course and keeping it at the right depth below the surface. For these purposes there are vertical and horizontal rudders in the tail. The horizontal rudders are worked by compressed air under the control of a pendulum in such a way that the slightest movement of the last-named puts in operation powerful gear for working the rudders. Merely keeping the torpedo level, however, is not sufficient. It must also be kept at a certain depth under the surface, so as to strike a battleship below her armour-plating without any risk of passing quite clear beneath the ship. The pressure of water upon any object immersed in it varies with the depth, and amounts roughly to one pound upon every square inch of surface for each two and a half feet. Thus at a depth of twenty-five feet the pressure is about ten pounds to the square inch. A device based upon this is used for keeping a torpedo at the right level, and if it dives below or rises above the proper depth this device acts upon the rudder-gear and steers the torpedo up or down as required.

A torpedo is kept on a straight course after leaving the tube by the vertical rudders, which are moved by compressed air under the control of a gyroscope. As in the case of the pendulum and the horizontal rudders, the compressed air does the work, and only a very small effort is

exerted by the controlling device. The peculiarity of the gyroscope, excepting the special type used in the gyroscopic compass, is that when it is spun its axis will continue to point in one direction, and it cannot be moved without considerable force. This feature applies only to the *direction* of the axis, and so long as this remains the same the gyroscope offers no resistance to being moved bodily. In other words, you can *move* it about, but you cannot *twist* it about. The gyroscope in a torpedo is set spinning by a spring which is released at the moment of discharge, and it is connected to a little valve for admitting compressed air to one side or the other of a piston which works the rudders.

Such are the main features of the modern torpedo, but there are many other small devices

for ensuring safety or greater effectiveness. Of these the delay-valve and the net-cutters are perhaps worthy of mention. The delay-valve holds back the compressed air from the engine until the torpedo is discharged. If this were not done the engine would 'race' in the tube and damage itself. The net-cutters are for cutting through the wire nets hung round battleships as a protection against torpedoes.

Torpedoes cost over one thousand pounds each; consequently they are not discharged unless there is a fair chance of hitting the object aimed at. So far the vessels hit by torpedoes have been stationary or only moving slowly; but it is probable that as the crews of submarines become more expert they will be able to hit a warship occasionally when she is moving at a high speed.

THE LONG PORTAGE.

CHAPTER II.

AFTER this disagreeable incident the attitude of Mr Potts underwent an entire change. It was clear now that there were other reasons why the clerk chose to remain at Whitewater, for the line that connected them with the civilised world was likewise the sole artery between Whitehorse City and the cities to the south. True, Potts was not the only man in the district who was known to be wanted by the police; yet it was clear to him now that Tim rode the high horse. The city clerk, being one of those obnoxious persons who can attune his moods to suit his purposes heedless of all conditions, proceeded to make the home life of the young Englishman a luxury joyous to experience.

But Tim was not without his suspicions. Had he known the man he had to deal with a little better, he would not have been without his fears also. The incident last described had brought home to the mind of Potts even more forcibly than before that the young Englishman was an impediment in the pathway of his desires. Tim had won the heart of the woman he loved; while, if the information the young man possessed became generally known, Potts knew it would cost him his job, and it was unlikely he would find similar employment in the neighbourhood. Since he was no woodsman, this would mean facing the southern journey, and farewell for ever to Evie.

Christmas found Mr Field in the country of the Hudson Bay, and Tim in charge at Whitewater Rapids. Two days previously a strong thaw had set in, and even a slight fall of rain; after which the thermometer dropped below zero with a sudden flop. The trails were simply a sheet of ice, which men and dogs alike were hard put to to traverse; but the moose, with its

knife-edged snowshoes, was entirely at home amidst such conditions.

On Christmas Eve Tim found himself with an important errand to perform at Kilween, and in consideration of the festive season suggested that Potts should ride with him—an invitation the clerk readily accepted. They set out at fall of dusk. A cheery 'Mush! mush!' from the young Englishman, and Moosewa, glad to stretch its legs once more, was bounding over the creek in its awkward, shambling gallop, the sledge rocking and bumping over the frozen snow with a force that threatened to shake the two occupants from their seats.

On either side was the darkness of the forest, from which the echoes came to meet them in multitudinous ghost-voices. The men talked little, for each was busy with his own thoughts. The thoughts of Potts were of the girl they had left at the bungalow and of the man at his side. They were not pleasant thoughts. Tim, too, thought of the girl; but after a time a new line of inquiry, for the moment more pressing, opened up in his mind. He noticed a strange uneasiness about the beast he was driving—noticed how the huge funnel-shaped ears twitched back and forth as at intervals a faint gust of wind fanned down the waterway. As yet it was dark as pitch, but Tim realised with relief that in an hour or so the moon would rise to light them on the return journey.

Presently they reached the spot known as the Long Portage. Here a trail led up from the waterway and wound across the face of the perpendicular bluff, finally crossing the divide. It was a track made for dog-teams, and none too wide at that; while on one side the cliffs dropped sheer to the creek below, a depth of three hundred feet.

The two got out, and slowly and steadily the moose toiled upward at Tim's heels. Its breath came and went in clouds of white vapour, settling on the coarse hair of the animal's flanks in white crystals of ice. The men experienced difficulty in keeping a foothold, while the sullen hiss of the rapids far below brought to their minds the significance of what a fall might mean.

'We'll have to use the sprag coming back,' observed Tim when at length the long ascent was completed, 'and I guess we'll borrow a bucket-load of sand at Kilween to scatter under the runners.'

The going for the remainder of the distance was now almost level, and Tim could have beaten his previous record even with the double load had he chosen to do so. But again he had noticed that questioning timidity on the part of the moose, and once it glanced nervously behind, its ears tense for the faintest unfamiliar sound. Time and again their speed increased almost imperceptibly, and Tim was compelled to throw his weight upon the reins to avoid the likelihood of a spill.

Reaching the city, the two men separated, agreeing to meet at the Frearson House Hotel in two hours' time. Tim's first errand was to procure a bucket of sand and place it in the back of the sledge; after which he purchased a string of horse-bells and attached them to the harness. Next he visited the cabin of an old prospector and miner who had just returned from a visit to the south.

'Got it, Sam?' inquired Tim eagerly as he threw open the cabin door.

'You bet your life I have, my son. A real gem. Just cock your best eye on that!'

Prompt to his appointment, Tim entered the saloon at Frearson House, where he found Potts in possession of a demijohn and gulping down neat whiskies against time. Just one for luck and the homeward journey; the moose, scared at the city lights, bounding down the main avenue at a speed which called forth the attention of every free dog in the neighbourhood. The bells tinkled merrily, and two minutes later the darkness of the forest once more closed upon them.

Ahead the trail shone like a pathway of glass in the moonlight, and ere they had gone a mile the moose suddenly broke into a gallop, the sledge skidding from side to side across the trail.

'Seems to know it has got its head toward home,' observed Potts, his tongue loosed by the liquor.

Tim glanced toward the darkness of the bush, then nodded meaningly at his companion. 'It's scared,' answered the young Englishman. 'Its nerves are just anyway. I kind of fancy we're in for a joy ride.'

Potts looked apprehensively toward the bush. 'You don't say!' he muttered thickly. Then, after a pause, he added, 'Game's been mighty

scarce for weeks past. Baynes says the wolves were devilish hungry along Snake Falls way. They had difficulty in keeping them off the packs. Devilish hungry!'

There was another long silence. 'See how it keeps listening!' exclaimed Tim as the moose suddenly slackened pace. 'It was scared all the way coming, and it's worse scared now. When you come to think of it, Potts, it's a blame silly game driving a moose at night-time through forests which wolves range for game. It's only natural they'll run it if they hit the scent.'

At that moment the moose bounded forward with a suddenness that threatened to snap the traces, while behind them a strange chaos of sound suddenly broke in upon the forest. Enhanced by a thousand echoes, it was like the note of a deep-toned siren, for a moment coming and going, then seeming to float away into distance above the tree-tops.

Tim had risen to his feet, his full weight upon the reins.

'They're after us,' muttered the city clerk. 'For God's sake let it go, Shields, or we shall be eaten, safe as houses!'

But Tim was aware that an exhausted moose would mean the closing in of the pack, with what results he dared not think. Potts had drawn a small automatic pistol from his coat, and kept his gaze on the white expanse behind them. He saw nothing, but presently a soft rustling and movement sounded from the forest on either side of the trail. Tim became aware of a gray ghost gliding noiselessly past the sledge on his left. He shouted to Potts. Potts fired, and instantly the wolf drew back into cover.

The moose was squealing with fear, and making frantic endeavours to free its head from the tension of the reins. The ghostly effect of moonlight and shadow, the obvious terror of their steed, the suddenness of the attack made upon them, were sufficient to unnerve the most hardened woodsman, and for once Tim appreciated the companionship of the city clerk.

'Seems to me there are four or five packs running us,' Tim observed presently. 'There's a fair bunch of them, anyway. Just listen to them going through the timber!'

Tim's gaze was fixed ahead, and suddenly he beheld a scene which seemed to freeze the blood in his veins. Potts slipped to the seat with a startled imprecation. A huge dog-wolf had taken up its stand in the very centre of the roadway ahead, and with gleaming eyes and naked fangs was awaiting the approach of the sledge.

Instantly slackening the reins, Tim, with a shout, brought the driving-switch across the back of the moose. The animal bounded forward in terrific leaps, evidently intent upon trampling the waiting wolf beneath its great splayed forehoofs. But the tinkle of the bells proved too much for the leader of the pack, and the wolf

bounded aside into the bush just as Potts again discharged the pistol.

'If they get at its legs we'll have to stand by and put up a fight,' muttered Tim. 'Don't run, for heaven's sake! or they'll down you.'

Potts had hurled the bucket of sand from the back of the sledge to lighten the load. The demijohn followed it. Then his eyes sought the face of his companion, and wandered back to the pistol in his hand. Tim was standing at his place and straining at the reins; he did not see the sudden wolfish leer that lit up the face of his companion or the scowl of hatred that succeeded it. Very deliberately Potts placed the pistol on the seat at his side; then, with a movement quick as the strike of a rattlesnake, his fist shot out. Tim clutched wildly at the rein-guide, missed his hold, and shot headlong from his place across the solid ice of the trail.

Once, only once, Potts glanced behind him. He saw a dark heap lying motionless in the shadows of the trees, and a triumphant smile curved his thin lips as the patter of moving paws in the bush on either side suddenly ceased.

Evie was alone at the bungalow, with only the Indian boy for company. Potts felt that the matter was now in his hands, for Shields, at any rate, was out of the running. The moose, free at last, bounded headlong over the frozen road, the lightened sledge skidding and ricochetting behind it. Crystals of ice beat against the face of the city clerk; the cold night air beat upon his forehead.

Then suddenly a slim gray ghost appeared like a sheet of vapour from the shadow of the sledge. It overhauled them at a bound, and with a startled cry Potts groped on the seat for his pistol. To his horror, it was not there; it had slipped down among the rugs, but in the frenzy of the moment he did not stoop to search for it. Gripping the driving-switch, he lashed out wildly at the wolf, all but upsetting the sledge; but with a snarl the brute vanished into the timber.

Potts was alone! He had left his companion behind him—that dark heap lying motionless among the shadows. He fell to lashing the moose with fiendish cruelty, while to the muffled rumble of hoofs and the jingle of the sledge-bells he added his own frantic shouts of 'Mush! mush! Curse you, mush!'

Red-eyed, panting, the great brute lurched forward, its crimson nostrils dilated, its terrified eyes seeming to start from their sockets. Again the streak of vapour shot past them, seeming to soar upward. For a moment Potts beheld the horrifying vision of a wolf hanging to the nostrils of his steed. With a scream the moose hurled it aside, and Potts felt the right runner pass over something soft and yielding.

The foam that flaked the pulsing chest of the moose was now touched with crimson. The huge funnel-shaped ears were laid back sharply across the scalp, giving a wholly devilish appear-

ance to the massive head. Once the brute halted as though to turn at bay; but the driving-switch cut through the air, putting an end to any such intention.

Potts had long since lost his landmarks, and too late he recognised the single dead tamarack that grew by the right-angled turn at the crest of the bluff. The trail suddenly turned to the right, and dropped to the level of the creek along the sheer face of the precipice.

It was an awful moment. Potts jerked the sprag upward, and a grinding and jolting told him that it was home. The moose took the corner at a bound, struggling to keep a foothold on the downward slope. But the blind eye of the brute was toward the face of the cliffs, and with a crash and the rending of timber the right runner struck a protruding ledge. The moose, jerked from its legs, sprawled headlong down the sheet of glassy ice, the sledge swinging broadside toward the face of the precipice. A cloud of ice-dust rose upward, a stifled cry of horror, then silence. Man, sledge, and beast had vanished from the trail, and from the very edge of the bluff an assembly of ghostly figures peered downward into the gloom.

For some moments Tim lay motionless beside the trail, a deep blackness before his eyes. He was aware that something was dragging at his leather coat; he felt the cold touch of fur about his face. Slowly he recalled what had happened, and quickly following came the realisation that to lie still meant certain death. His hand groped for the knife at his hip, and he struck out wildly at the dark shape above him. With a snarl the wolf leapt back, and Tim struggled to his feet.

A moment's panic would have cost him his life as he stood in the centre of the trail, knife in hand, every nerve of his body tense, conscious that many invisible eyes were watching him from the darkness of the timber. In the distance he could still hear the pounding of hoofs and the tinkle of sled-bells.

At the sight of the formidable waiting figure in the centre of the clearing the wolves recalled their natural fear of man, and doubtless decided that there was easier game to be had in their natural prey—a half-exhausted and wholly terrified moose. Tim heard a questioning *gurr-woff*, followed by the pattering movement of paws in the timber. Then silence closed in upon him.

Tim remained motionless till the cold warned him to move on; then, dazed and stumbling, he continued along the trail. As he reached the dead tamarack above the creek a ghostly and horrible sound came from the depths below. He peered downward from the trail into the gloom of the gulch, and saw in the moonlight a mass of ghostly figures assembled on the rim-ice between the cliff and the rapids.

One glance at the trail was enough for Tim.

With a shudder of horror he hurried ahead, the eerie sounds gradually fading away.

'You are late,' said Evie, as she met him on the veranda with a smile of greeting. 'Don't tell me that you've left Potts behind you! I couldn't bear it!'

'We sha'n't see him this Christmas, anyway,' Tim answered, with a brave endeavour to echo her laugh. 'But, say, Evie, I've got all the things you asked me to get, and'—here their eyes met—'there's one present I'm not going to wait until to-morrow to give you, 'cause I'm in no end of a hurry, and—say, old girl, will you take it?'

He drew from his pocket a diamond ring, a

real gem, as Sam had described it; and without further ado slipped it over her yielding white finger.

'Now, old girl,' he said finally—'now that there's no one in our way, I'll tell you the whole story about Potts.'

He would have kept it from her, for a time at any rate, as he had already kept so much; but no way occurred to him by which he could avoid telling her of the adventure and disaster. 'So poor old Potts has crossed the Long Portage,' concluded his story. 'Our first duty to-morrow will be to go down the creek; but, Evie, I'm afraid there won't be much to bury.'

THE END.

AMBASSADORS IN WAR AND PEACE.

By W. V. ROBERTS.

PROBABLY at no period of history have the diplomatic arrangements of the world been so disorganised as at the present time. The United Kingdom interchanges embassies with nine Powers—Germany, Austria, Turkey, France, Russia, Japan, the United States, Italy, and Spain—and legations and consulates with many smaller States. As to the nine Great Powers, our Ambassadors have been withdrawn from the capitals of the first three in the list; the second three are our Allies, whose relations with the first three are necessarily affected; and the last three alone remain out of the conflict. The position of Belgium is peculiar. Its Government retired into France in face of the onrush of invasion, and it is still, of course, recognised by the British Allies as the *de facto* Government. But Brussels is under a German governor, and the only diplomatic representative of great authority remaining there is the Minister of the United States.

On the whole field the net result is temporarily to give to the representatives of the United States, as the strongest Power not engaged in war, largely accentuated influence in all the capitals of the belligerent nations. That circumstance explains why it is that the people of the United States are able through their Minister in Brussels to distribute food to the starving people of Belgium. The people of the United Kingdom are subscribing liberally to the relief of these distressed Belgians; but in the vast area of Belgium the people of this country have no footing, and cannot themselves distribute their relief; hence the value of the good offices of the United States Minister. It was through their Ambassadors or Ministers, again, that the children of the United States were able to send their Christmas gifts to the children of all the warring nations. The children of the United Kingdom, having no Ambassador or Minister to represent them in the enemy

countries, were without official agency for the distribution of their Christmas gifts.

Diplomacy works so silently and so much behind the scenes that its place in a foreign country is not always recognised. To break off diplomatic relations is sometimes, though not always, tantamount to a declaration of war. When a representative is withdrawn the interests of his people can only be left to the good offices of the representative of some neutral Power who remains. But while the relations between country and country continue unbroken the position of the respective Ambassadors is interesting and unique. As representing his sovereign and Government, the Ambassador stands apart from all his compatriots. The embassy he occupies is to all intents and purposes part of his own country. An Ambassador, for instance, is not amenable to any law save that of his own land; he may not be arrested; neither may any member of his family or entourage; nor may his goods be distrained upon. The embassy is in ordinary times, in effect, a sanctuary inviolate. A few years ago an interesting controversy arose in London because of a report that a prominent Chinaman, Sun Yat Sen, was being detained as a prisoner at the Chinese Legation. Little or nothing could be done on his behalf. Although his case evoked widespread interest, days elapsed before representations by Lord Salisbury could secure his release. During the Boxer riots in China the conditions were reversed. Europeans, especially missionaries and their families, who were in peril sought refuge in the British and other legations. There they remained during much fighting; and, although lives were lost, the legations were undoubtedly, for the reasons indicated, the safest places at the time. There are, therefore, occasions when the security of an embassy or legation becomes something more than a mere name.

Because of the fact that the communications which pass between an Ambassador and his Government are so exceedingly delicate and confidential, an embassy naturally becomes sometimes the storehouse of secrets in black-and-white that no Minister would wish to have divulged. Most people will remember what a hurried flight, under conditions of grave discourtesy, our Ambassador, Sir Edward Goschen, had to make from Berlin in August last, when war was declared. It is probable that many things of importance were left behind; but it may be hoped that the building is being guarded at least as carefully as the German Embassy in London during the continuance of the war. One day both embassies will be reoccupied, and respect now for private property will then be an aid in promoting goodwill.

But an embassy is not merely the office of a representative or agent; it is a social centre almost regal in its appointments, the Ambassador being often the host not only of his own sovereign but of the sovereign of the country to which he is accredited. Not many months ago M. Poincaré, President of the French Republic, visited London, where he had a most enthusiastic welcome. His rendezvous was the French Embassy, whence he visited our King, and where our King paid his return visit. Later King George visited Paris, and the British Embassy, of course, became to him what the French Embassy in London had been to M. Poincaré. So with other people of influence and importance. Viscount Morley, in his *Life of Gladstone*, for example, quotes from that statesman's diary some notes of a visit to Paris during his premiership in 1883, an admirable little sketch of the ordinary influence of an embassy:

'27th, Tuesday [February].—Reached Paris at eight, and drove to the embassy, where we had a most kind reception [from Lord Lyons, British Ambassador]. Wrote to Lord Granville, Lord Spencer, and Sir W. Harcourt. Went with Lord Lyons to see M. Grévy [President of the Republic]; also M. Challemeil-Lacour [Minister for Foreign Affairs] in his most palatial abode. Looked about among the shops and at the sad face of the Tuileries. An embassy party to dinner; excellent company.'

But people other than Prime Ministers call at embassies, and with some Americans introductions to their Ambassadors at the European capitals they may visit are sometimes said to be carried to the extreme.

To such a calling as that of Ambassador there are, of course, many aspirants. Few, however, are chosen. The diplomatic is the most exclusive branch of the public service. Special gifts and training are required in view of the delicate nature of the work to be undertaken; and it is held by some that influence in high places at the Foreign Office goes a long way toward

securing the first stepping-stone. Indeed, a candidate must in the first instance obtain the permission of the Secretary of State to appear before the Board of Selection. In any event, there is a tedious road to travel before the higher prizes may be reached, the steps including third, second, and first secretaryships, the position of *chargé d'affaires*, and Minister of Legation before the office of Ambassador is attained. An attaché receives no pay for the first two years of service, and only one hundred and fifty pounds a year for the next four or five years. Hence the condition that he must have a minimum private income of four hundred pounds a year. Even when he has obtained an appointment, a man may spend years away, say, in South America, or in some out-of-the-way part of the world, before securing a congenial post; or promotion may come by sacrificing for a time an appointment in one desirable city for something higher in rank in a less desirable city. The embassies in Paris, Vienna, Berlin, or Rome are those most eagerly sought, though it is said they are not always the best training-grounds for the younger diplomats.

Sir Edward Malet, one of the most distinguished Ambassadors of recent years, records in his book, *Shifting Scenes*, the circumstances under which he was transferred from Rome to Constantinople. He was in London in 1878 on leave from Rome. On his visiting the Foreign Office, a hint was given to him that Lord Salisbury desired him to go to Constantinople, and would not like to be refused. Sir Edward would have preferred to stay in Rome, but he writes as follows of the interview that ensued:

'Lord Salisbury . . . said to me immediately, with the kind, grave tone which is habitual to him, "I am going to offer you a change which I fear may not be agreeable to you. We have had accounts from Constantinople which lead us to fear that Sir Henry Layard's health may oblige him to come home, and we wish you to go out to be in charge in case our fears are realised." I said at once I was deeply obliged to him, and it was speedily settled that I should start forthwith.'

Financially, the Constantinople appointment was worth one thousand pounds a year more than that at Rome. As already explained, the United Kingdom has nine embassies abroad, and in point of remuneration Paris stands highest with eleven thousand five hundred pounds a year; Berlin, Constantinople, and Vienna follow with eight thousand pounds; St Petersburg (or Petrograd, as it is now called), eight thousand pounds; Rome, seven thousand pounds; Washington, ten thousand pounds; Madrid, five thousand five hundred pounds; and Tokyo, five thousand pounds. For salaries of Ambassadors, Ministers, staffs, and the upkeep of their buildings abroad, Great Britain pays something like six to seven hundred thousand pounds a year.

Until quite recently, the interchange of embassies was confined to the Great Powers of Europe. The United Kingdom and the United States were, as between themselves, content with a legation for the transaction of their business; and so distinguished a man as Russell Lowell was one of the last American Ministers of Legation in London. But the feeling grew that, in view of the magnitude of the interests, both countries should establish embassies, and the change was made in 1893. The United States makes a point of choosing some of its most eminent men as European representatives. A publisher and editor was in 1913 appointed to England, Dr Walter H. Page, of Messrs Doubleday, Page, & Co., New York. On this side, so prominent a man as Mr Bryce, now Viscount Bryce, gave up a seat in the Cabinet to go as British Ambassador to Washington, where his writings, especially on the American Commonwealth, made him a *persona gratâ*. Embassies between Spain and the United Kingdom were established in 1888; and those between Britain and Japan followed the Japanese war with Russia and the treaty with this country.

It is sometimes slightly said that the duty of an Ambassador is to lie abroad in the interests of his country, and such jests are hard to kill. Prince Bismarck, in his younger days, probably had the tradition in his mind when, writing of a ball at the embassy at Frankfort, he spoke of 'a great many odd stiff ladies who lisp English when they lie.' It is certain that the methods and duties of Ambassadors have of late undergone some change. In the olden time all important despatches between Foreign Offices and embassies, and *vice versa*, were carried by king's messengers to ensure safety and privacy, and the practice still obtains; but the telegraph and telephone have modified and simplified procedure, and may do so still more.

Facility of reference to his Government may

relieve an Ambassador largely of the discretion he might formerly have exercised. It is recorded that on one occasion Lord Lyons, then British Minister at Washington, was instructed to present an ultimatum to settle some dispute, and break off relations if it were not accepted within twelve hours. The Secretary of State asked for twelve hours more. Lord Lyons, on his own responsibility, agreed, and the situation was saved. On the other hand, during the negotiations in Paris in 1860 for settling the commercial treaty, the British Ambassador refused to decide a trivial point without instructions from home—a fact which led Cobden to say that when he was 'a bagman at home travelling for orders' he had more power than the Ambassador.

There may be occasional indiscretions, as in the case at Washington a few years ago, when Lord Sackville was said to have departed from correctitude in regard to the presidential election. But it is well to remember the words of Lord Dufferin, one of the wisest diplomatists who ever served the United Kingdom, when he compared himself to a man in fustian with a tin pot, who went about pouring oil into the wheels of a complicated machine—an allusion that aptly applies to much ambassadorial work. It is indeed a debatable question whether the Ambassador on the spot or the Government at home always makes the wiser decision. Sir Arthur Gordon, afterwards Lord Stanmore, relates in his Life of Lord Aberdeen that during the negotiations which immediately preceded the Crimean war the insertion of the words 'for a reasonable time' in a despatch sent to our Ambassador at Constantinople was attended by disastrous consequences, as the Turks seized upon it to suit their own purposes. But, broadly speaking, it may be said with truth that the mistakes which diplomacy makes are few compared with the dangers which it undoubtedly averts.

THE MONTH: SCIENCE AND ARTS.

PERISCOPES FOR THE TRENCHES.

THE development in warfare in the western area, and the existence of practically a state of siege, owing to the elaborate and intricate network of trenches and field fortifications, have been responsible for new tactics. The opposing lines are so near to one another, and sapping operations are conducted with such vigour on both sides, that rifle-firing has been rendered exceedingly hazardous, as the men dare not show their heads above the trench, for they are certain to be picked off by vigilant snipers. The result is that practically operations have to be carried out by periscope, and the urgent need for such instruments is revealed in the letters received

from officers in the firing-line. A soldier saved is a soldier gained; hence the demand from the officers. But a periscope, to be of any real service in the trenches, must be specially designed for the work, and British manufacturers are now directing their energies to the supply of this need. Recently an excellent instrument of this type at a low price has been introduced, and it adequately fulfils all the requisite conditions. It gives a brilliant view over a wide area, and may be used with any binocular. It also meets the requirements of portability, inasmuch as it is collapsible, and folds into a compact sling-case measuring about twenty-one inches in length by four inches wide and one and a half inches deep; further, it is of substantial construction,

being made of metal, and painted a neutral tint. Its complete weight, including spare mirrors, is within four pounds, and it is furnished with an extending leg to fix it to the trench. As the officers are requesting these periscopes instead of cigarettes and comforts, it would be worth while to use a portion of the funds being collected to assist our fighting men for the purchase of these instruments. Thus no difficulty should be experienced in satisfying one of the most urgent needs of the men at the front. This periscope is known as 'ork-oie.'

THE AUTOGRAPHIC CAMERA.

With the approach of spring thoughts turn to the open air and photography. A hand-camera is a good companion, but the difficulty of making at the time a note of the object photographed is generally experienced, as the operator frequently forgets to make this entry, mainly because it demands the withdrawal of a pocket-book for the purpose, which is considered too much trouble. For many years inventors have been endeavouring to perfect a simple process of writing the necessary title upon the plate or film itself immediately after the exposure has been made, but the difficulties appeared to be insuperable. An American inventor, however, solved the problem, and some idea of the value of the development may be gathered from the fact that the patent was purchased for the sum of sixty thousand pounds by one of the leading American photographic camera manufacturers. With this camera it is possible to write upon the film itself, immediately the exposure has been made, the title of the subject, or any other useful general particulars, together with details of the light conditions, stop, and exposure. The inscription is permanent, and is of incalculable assistance when development is undertaken.

THE ELECTRIC VEHICLE.

We have become so familiar with the petrol-driven vehicle and its many conveniences that it seems almost impossible to improve upon the system. But this ubiquitous method of propulsion is encountering a serious rival; and although the competition is not yet pronounced, it promises to become considerably keener in the near future. This is the electric vehicle. Electricity as a propelling agent for cars and wagons was tried before the explosion motor came into vogue, but at that time it was a complete failure. Now, however, many of the defects incidental to the early vehicle have been overcome. The great advantages of electricity are silence, reduced wear and tear, especially in regard to tires, saving of lubricants, and remarkably lower running costs. In fact, the economic advantage over the petrol system is extraordinary. Thus in one Scottish city, where a one-ton electric vehicle is in use as an experiment, an average of nine hundred miles per month is

being maintained at an annual expenditure of two hundred and forty pounds, whereas identically the same work performed by a similar petrol car costs four hundred pounds per annum. Commercial houses are also becoming attracted to the new method, and electric cars are being run in competition with petrol-driven vehicles of similar carrying capacity, so as to obtain reliable comparative data. In the case of one large firm it has been found that the electric vehicle can be run for two-thirds less than the cost of the petrol car. Municipalities appear to be devoting considerable attention to this, as the majority of them own electric tramways, so that the utilisation of electric buses to act as feeders to the tramways is a logical step, for the simple reason that electricity is readily and cheaply available, and can be controlled by the one staff, whereas the petrol-driven vehicle demands a distinct and special organisation which tends to inflate the expenditure to an unwarranted degree.

A NEW TINDER LIGHTER.

While a thoughtful public has subscribed readily and freely toward the supply of smokes and matches for our soldiers at the front, the last-named article has not given complete satisfaction. Wind and rain have militated against its successful or economical use. A tinder lighter is far more useful and satisfactory under such conditions. Some four years ago a lighter of this description was introduced, and enjoyed a huge vogue, but it suffered from the disability that the tinder required to be soaked in petrol. Such a contrivance is useless at the front, owing to the impossibility of obtaining the petrol. Recently an improved lighter has been devised which requires no spirit or petrol. The tinder, in the form of a woven cord or thick wick, is fed through a short length of tube, to which is attached a smaller tube carrying a milled wheel; and when this wheel is turned smartly it strikes the flint and emits a spark which instantly ignites the tinder. Owing to the area of the spark a large flame is obtained which defies extinction by the strongest wind. When it is desired to extinguish the tinder a pull is given to a short length of chain attached to a ball, and this fits into the end of the tube, thus quenching the flame and keeping the end of the tinder wick in a perfectly dry condition.

THE COOLIDGE X-RAY TUBE.

The Coolidge X-ray tube, the first appearance of which some months ago created a sensation, is now manufactured on an extensive scale, and is used in the military hospitals at the front. This tube represents as great an advance in X-ray operations as the motor-cycle upon the dandy-horse. It does not demand such delicate handling as its prototype, can be easily and readily adjusted to any degree of intensity, en-

ables the quality of the rays to be reproduced as often as required, can be used continuously, enables the work to be carried on at a higher speed, and to a certain extent can be used instead of radium, as rays can be emitted resembling the gamma rays of the radio-active mineral. One tube can also be used for various classes of work, while its average life is about a thousand hours. A medical correspondent, writing from the Queen Elizabeth Hospital at Calais, describes the X-ray installation there, a gift of the brother-in-law of the king of the Belgians. By its means an instantaneous photograph of parts of the body is secured by a powerful electric installation, and an ingenious arrangement of negatives with a mirror gives a stereoscopic picture, which shows the position of bones and foreign bodies, and enables them to be exactly located.

THE 'CLARE ISLAND SURVEY.'

The Royal Irish Academy is publishing what may be described as one of the most remarkable series of memoirs ever undertaken. It is known as the *Clare Island Survey*, and represents the work of more than one hundred specialists during the years 1909-11, covering the flora, fauna, geology, meteorology, &c. on the Clare Island and the adjoining mainland. The island was selected for this scientific undertaking not only because it is typical of western Ireland, but because it is one of the most interesting spots in Europe from the faunistic and floristic points of view. It is claimed that this report, when completed, 'will provide the most complete survey of the fauna and flora of a definite area which has ever been made.' The report will include descriptions of some fifty species of plants and animals new to science, in addition to records of some two hundred species which are new to the British Isles, and at least one thousand species which are new to Ireland.

TRAINING ELEPHANTS TO WORK.

An interesting effort is being made in the Belgian Congo in the endeavour to raise and train the African elephant to perform domestic duties, and to become a useful beast of burden. Elephants are employed in Farther India for a variety of purposes, such as handling and stacking lumber. It was the success in this instance which prompted the Congolese experiment. A training station was established in that part of the country where the animals are particularly numerous, and Captain Laplume, who is carrying out the work, caught his first elephant in 1900. Three years later the stock had been increased by capture to fifteen head, while now he has thirty-four animals. Only young elephants were caught. As they grew tamer and older the investigator commenced his training course, utilising the animals for carrying, haulage, and ploughing. The effort has met with success, inasmuch as he has now sixteen animals which

are proficient in this work, perfectly tractable and docile, while the others are shaping in a promising manner. As a result of his experience the captain states that the task of training is not difficult, while the animals are of distinct economic value in the Congo, where other beasts of burden are not readily available.

THE SIGNIFICANCE OF THE SUBMARINE.

So far as naval operations during the present war are concerned, the submarine has come very prominently before the public eye. Mr Horsnail contributes a paper on the subject at page 190. Strange to relate, the average individual possesses a very slight knowledge of this craft and its possibilities, which is undoubtedly due to the fact that developments in building have been jealously guarded by the various Powers. The latest example of this arm is particularly formidable. For instance, the modern German submarine, which is of the *Germania* type, has a radius of action of three thousand miles; that is to say, it can travel fifteen hundred miles from home and then back again upon a single fuel charge. It is able to descend to a depth of one hundred and fifty feet with safety, and to lie at that depth, if necessity compels, for a round eight hours; while at a shallower depth it is able to remain submerged for twenty-four hours. It can carry sufficient provisions to keep its crew for about a month, the latest processes for compressing comestibles facilitating this practice. It may be pointed out that the submarine which was built in this country for the Australian navy travelled from the British shipyard to the Antipodes under its own power, thereby completing the longest journey ever made by a submarine. The one defect of this craft at present is its comparatively slow speed, which limits its utility somewhat appreciably.

WIRELESS IN WAR.

Comparatively little has been heard of the utilisation of wireless telegraphy in the present campaign, at least so far as the military operations are concerned. This is due to the fact that in the present stage of the development of the science it is unsuited to the task. Aeroplanes have been equipped with wireless, but the fact that communication cannot be maintained over a distance exceeding thirty or so miles is a militating feature. Again, the fact must not be overlooked that wireless has not been rendered absolutely secretive. A message despatched from an aeroplane is picked up by every station within range, by friend and foe alike. True, it may be useless to the enemy, being in code; but the foe finds the receipt of the message useful in other ways. In the first place, he is apprised of the fact that his antagonist is on the move, and in a certain degree can estimate roughly the approximate distance of the aeroplane. Then there is always the risk of a coded message being decoded,

especially as experts in cryptography are retained upon all military staffs for this work. Military strategy has been reduced to such a fine art that it does not pay one side to permit the other to gain the slightest information. Wireless is likely to reveal the approximate position of the sending station, inasmuch as the ranges of portable or mobile stations are pretty generally known. Moreover, this method of communication can be rudely upset. The foe has only to transmit a meaningless and continuous jumble of letters or words in rapid succession. These become associated with the actual message, and invariably render it indecipherable. All things considered, wireless is one of the scientific wonders which has not established its value as a military asset in the present campaign.

A TELEPHONE WITH A MEMORY.

Devices for making a telephone 'remember' what is said to it have been available for many years, but have never been commercially successful. The 'telescribe,' an instrument of this type recently devised by Thomas A. Edison, is said to be both simple and practical. A little desk-instrument is used, by means of which one of the parties to the telephone talk may record the conversation on a phonograph cylinder. The process is as follows. The receiver of the regular desk-telephone is first removed from the hook and placed in the socket of the telescribe; then the user takes up a small receiver, which is part of the telescribe, and gives his call to the exchange. He can start and stop the dictating machine by means of two small buttons on the telescribe in order to record the conversation between pauses or delays, thus avoiding any waste of running the wax cylinder meanwhile. Both sides of the telephone conversation are recorded, including all evidence of the central operator's voice in making connection. The telescribe, it is believed, will place the use of the telephone in a more serious light in business. After a conversation the dictator will turn to his dictating machine, and confirm his message in the usual manner covering the general understanding. The wax records may be retained indefinitely for reference.

THE DOMESTIC FUEL OF THE FUTURE.

The article in our January issue entitled 'The Domestic Fuel of the Future' having called forth a number of inquiries from interested readers, who are wishful to know whether the fuel described is as yet available for general consumption, we have communicated with the author, who furnishes us with this further information. The low temperature process of distillation of coal for the recovery of oils, benzol, and other valuable by-products is now in operation at many collieries throughout the country, notably at Sheepbridge and Clay Cross in Derbyshire, Low Moor near Bradford, Snydale near Nor-

manton, Brackley near Manchester, at the Barnsley Main, at the 'D' pit of the Lambton Collieries near Durham, and elsewhere. The coke produced by these various plants is, however, practically all consumed by the local ironworks, leaving no surplus for general consumption. The preparation of a lightly coked coal for domestic use will come gradually, as the supply of oil and benzol begins to overtake the demand, and when, also, more coke is produced than is needed by the ironworks and factories. A brave attempt to inaugurate a household business in this fuel was made by the British Coalite Company of Barking, Essex; but owing to the active opposition of the gas companies and other interests in London, who viewed the new fuel with jealousy, the effort has proved almost fruitless. The company still exists, and its pioneer work has thrown much light upon the potentialities of the low-temperature distillation as a source of oil as well as of an admirable domestic fuel. Other companies near London producing similar fuel are the Tarless Fuel Company of Battersea and the Oil and Carbon Products, Ltd., of Barnea. Anthracite, which is found in South Wales, would of course provide a complete solution of the smoke problem; but, apart from its great cost, it requires a sharper draught for successful combustion than is usual in most open-fire grates. The whole point is that it is becoming profitable to distil coal for oil, and not only for gas as heretofore, and in so distilling it a by-product is obtained which makes an admirable domestic fuel. In gas-making every bit of volatile material is drawn out at high temperatures. For oil-making these high temperatures are destructive; hence the residue coke after oil distillation still contains sufficient volatile constituents to render it suitable for open fireplace combustion.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

LOVE'S IDOL.

THERE is an idol in my heart,
And of my very soul a part—
The image of a loved one's face,
A never-failing source of grace;
Turning darkness into light,
It ne'er deserts me day or night.

It flees not when an evil star,
A-seeking out the world to mar,
In adverse wandering casts the gloom
Of frowning fate where love should bloom;
And, though obscured may be my path,
There cometh forth love's aftermath.

Pity broodeth in that eye
So eloquent of charity,
Appealing more than silv'ry speech
Or aught that human art can teach.
Her name is Love, and Love is she,
And where man is must ever be.

JAMES MELDRUM.

Chambers's Journal

SEVENTH SERIES

THE STRANGLERS OF POLP.

By C. EDWARDES.

CHAPTER I.

IN one active week the Duke of Wesen—thirty-five, a direct descendant of Henry the Fowler, with much other royal blood of more recent tincture in his veins, and one of Europe's handsomest and most esteemed noblemen—had lunched or dined with four kings and the president of a republic, each in his own capital city. All these influential personages had afterwards, metaphorically or positively, patted the Duke on his broad back, and wished him 'God speed' toward the cut-throat country which they had collectively decreed should, until further notice, be a kingdom, with a throne upon which the Duke might sit if he dared.

He and his wife Adela had agreed to dare. He was in London now for his fifth royal meal and conference within eight days; also, to complete the arrangements about a loan of one million pounds with Shemstein, the famous banker of Leadenhall Street; and to be newly measured by his English tailors, Ponting and Proud, the world-renowned Bond Street people, for certain of his requisite garments of state.

The Buckingham Palace interview was over. It had been as gracious and encouraging as he was given to understand that it would be; and a subsequent half-hour with the Secretary for Foreign Affairs was equally agreeable to both gentlemen.

Shemstein the banker, however, was not quite so easily dealt with. It was not a question of security about the money, because the European Powers who had offered the Duke this crown were themselves guarantors for the million.

'Your Highness,' said Shemstein, as soon as he had bowed the Duke to a chair, 'I am grieved to inform you that I find the transaction too dangerous. I have lately received a threatening letter'—

'From some of my dear Blenarian irreconcilables, no doubt? Oh, that is nothing, Mr Shemstein,' laughed the Duke.

'But I am to be *shot*, when I least expect it, your Highness,' urged the banker, 'if I do anything to help in the constitutional settlement of their country! My wife and family implore me to withdraw from this undertaking, and for their sake'—

'And I, Mr Shemstein,' interposed the Duke, No. 223.—VOL. V.

'am to be strangled before midnight to-day for my presumption in accepting the crown of Blenaria. Perhaps you have not heard of the Stranglers of Polp? It is a very bad, old-fashioned part of Blenaria, this Polp, and the strangle is the favourite way of despatch they have in the vendetta of private life. In my opinion it is a very unpleasant one, and so we will not discuss it. Behold, here is the letter that gives me the obliging news! It is signed by five individuals—in cipher, naturally—who are here in London as representatives of the party of disorder in Blenaria. Excuse me, I may smoke a cigarette? Yes!'

While he spoke the Duke calmly made a spill of the unpleasant communication, which he then took to the fire. 'It troubles me no more than this, my dear friend,' he continued, not quite truthfully, as he returned to his chair.

The banker had already shuddered. Now, with his eyeballs very much in evidence, he murmured faintly about the harassing effect upon his mind of the menace with which he had been favoured.

'My talisman is here, Mr Shemstein,' said the Duke, with his hand to his heart and the breast-pocket from which he had taken his own epistle of doom.

'But we are not all endowed with such courage and such wonderful nerves as your Highness,' demurred the banker.

The Duke disclaimed an exceptional allowance of either; and then, deliberately or otherwise, he proceeded to shock the banker still further in a different quarter. If an extra half per cent. interest per annum upon the coupons of the loan would overcome or allay his anxieties about his life, he suggested that it might be conceded. But he begged Shemstein's pardon the next moment so winningly, with his hand out to be clasped, that the banker's scruples began to melt fast.

'I did not mean that, my friend,' he explained.

'It was only an effort of diplomacy, an art to which I am as yet unaccustomed. All is fair, is it not? in Finance, as in Love and War. But I see I have almost persuaded you, and therefore I am justified of my baseness, my good friend.' He consulted his watch. 'I have, however,

[All Rights Reserved.]

MARCH 6, 1915.

much to do,' he resumed. 'I can give you only a few minutes more. There are my stranglers to prepare for, and much else, if I am alive. But I tell you what. You will send one of your clever young men of business to establish a house of credit in my capital next month. And by Christmas, or perhaps before, I shall, I hope, institute my first order of nobility in Blenaria, and have the satisfaction of including your important name in my earliest list of creations. Come, we are agreed, are we not, my friend?'

The Duke's magnetism was entirely successful in the end. Ten minutes later the banker escorted him to his waiting car as respectfully as if he were already an esteemed and quite safe European monarch of long standing. But Shemstein made a hasty return to his desk the instant the car moved. The Duke's parting pleasantry was not at all to his taste, in spite of the gay air that accompanied it.

'I have now three ladies to visit, all charming, and I must, I believe, keep a watch on my neck all the time. Good-bye! Good-bye!'

The Leadenhall Street pavement was as crowded as usual during business hours. Nevertheless, these words of the Duke made the banker feel ridiculously solicitous about himself until the heavy door of his bank had swung behind him and he was under the immediate protection of his host of clerks at their desks.

Nothing of vital consequence befell the Duke between the City and Hyde Park Gate, the first of his three places of social call. To be sure, there was a traffic block in Cheapside which brought the car to a stand, and tempted a beggar to be bold. The man pushed his arms through the open window of the Duke's car and cried, 'Give me something. I'm starving!' with such apparent ferocity that he momentarily startled the Duke. Moreover, his grimy fingers had reached almost to the Duke's throat. But he was clearly only the poor destitute object he assumed to be, and the Duke's hand was in his pocket for a coin, when the man was roughly thrust aside by a gentleman, who then turned and shook his head at the Duke with an expression of almost mournful concern.

'Uncharitable imbecile!' exclaimed the Duke. 'Give him this at once.'

The uncharitable imbecile was Captain Albrecht von Ensling, his aide-de-camp and determined shield and buckler throughout this European tour. He accepted the rebuke and the proffered sixpence in silence. Then the traffic moved, and the Duke had time only to call to him, 'And no more of this shadowing nonsense, my good fellow, or I shall be really angry with you. You may expect me back at the Ritz by six o'clock, all right, never fear.'

He spoke impatiently, yet as if he were amused. Then he recessed himself out of

general sight, and took from his pocket the talisman he had mentioned to Mr Shemstein—a letter-card received that morning from his young and beautiful wife, who was already in Blenaria working in his interests and those of Blenaria itself as he knew that no one else could. He kissed the coronet on the flap of the envelope, and then read again her stirring lines, which at the first perusal had made him clench his fists and assure himself that it should be so. He would endeavour to be as fearless and brave as herself. No man could be more than that.

'From your droll but so picturesque palace in preparation.'

'MY ULRIC,—This I have learned since yesterday. Your movements in London are all known, and you will be watched and followed everywhere. But there is one sure way to gain all the hearts of Blenaria, even those which now most wish evil to you. Be fearless and as brave as man at his noblest. Almighty God is in His heaven. All my prayers and thoughts are with you night and day, *carissimo*. ADELA.'

'*Carissima!*' echoed the Duke, very softly and reverently, as he replaced the card in its cover.

While the car glided through High Holborn and past half the great shops of Oxford Street he held the card to his heart, with a rapt expression in his eyes. Then the weakness, if such it were, passed. 'This will not do!' he said, straightening his back. 'I must be of iron, not silk and sentiment. These strangling rogues! It is well she does not know of this cheerful part of the day's programme, my Adela! I wonder'—

He was still wondering how and when, or if at all, his neck would be confronted with its peril when the car drew up and he stepped forth. 'Perhaps it may even be here!' The thought flashed, and was so entertaining an absurdity that in a minute or two he was sharing it with the first of the three noble English ladies whom he was honouring that afternoon with a fraction of his valuable leisure.

'Permit that I look behind the screens and things before I seat myself, Countess?' he said afterwards, almost as if he meant it.

'But you must be jesting, my dear Duke!' protested the shocked lady.

The Duke's prompt laugh consoled her. 'Yes, yes,' he said. 'It is true about the letter the rascals sent me, but without any doubt they too joke like myself. I should not have told it to you; but you must now forget it and give me a cup of tea. These excitements are the one thing necessary, Countess, to convince us—my wife and me—that we truly are king and queen like the others on the map, though in a very small way, and with not many diamonds in our crowns yet. It is our deplorable duty to suspect everybody at first, even those most dear to our

hearts; and so even you yourself must promise me that there is no poison in the tea.'

He took the same stout humour with him to his other two lady friends, but said nothing more about screens and stranglers.

It was a quarter-past six when the Duke returned to the Ritz; and again, as in Cheapside, he had at once to remonstrate with his devoted seneschal Von Enseling, who received him on the pavement outside the hotel with a fervent whisper of 'Thank God, sire! Another five minutes, and'—

'And what?' inquired the Duke. He took the aide-de-camp's arm and feigned annoyance. 'You conceive that I am to behave like a machine to oblige you? By the Bones of Saint Zaphanie!—as one must say in Blenaria when one is very cross, remember—is it that I have kept the tailor kicking his heels for me, my friend? Or perhaps Messieurs Ponting & Proud are so busy making coats for the English Nuts that they have no time to attend to a somewhat incomplete king—eh, is it that?'

'It is yourself, sire. Your precious life'—began Von Enseling.

But the Duke checked him. Pressing Von Enseling's arm to his side, he laughed and said, 'Bah, bah! He has no trust in Providence, this young infidel of mine. But come! The *ascenseur* is ready for us, and the tailor too, I hope.'

'Since six o'clock, sire, yes; but'—

'Enough said, then, Albrecht *mio*!' exclaimed the Duke curtly, as he led the way to the lift. He sat down in it, folded his arms, and drew a deep breath as of relief. 'I think we are running through our day in London very nicely, my friend; and there is nothing for you to look so worried about,' he said as the lift rose. 'While I am with Mr Proud'—

'Mr Proud has not come,' interrupted Von Enseling. 'He was taken ill, sire, it appears, at the very moment he was about to wait upon your Majesty, and one of his young men has come instead of him.'

'Oh, well, it does not matter who it is, so that I get my clothes made,' said the Duke indifferently. 'But that reminds me, Albrecht. I wish you to send a second telegram to Blenaria, *tout de suite*, to say all is still well with us, and that I shall not again leave the hotel until we go to dine with the Italian Ambassador. But fewer words than that, because my dear subjects over there do not like to pay taxes, they tell me.'

The lift stopped, and, laughing softly about this peculiarity of the Blenarians, the Duke strode into the corridor.

Von Enseling would have followed, but the Duke turned and was peremptory with him.

'Did you not hear what I said about the telegram, my friend?' he asked, with a look and mien that brooked no opposition.

The Duke's body-servant, Hans Reuter, came into the passage at the sound of his master's voice, and was soon helping the Duke to prepare for the measuring-tape of Messrs Ponting and Proud's gentlemanly and exceedingly well-dressed young representative.

'So Mr Proud is poorly? I am sorry for that,' the Duke had remarked, after an affable nod for the dark-eyed young fellow, whose bow and tremulous 'Good-evening, sir!' seemed to indicate some natural nervousness about the honour thus unexpectedly put upon him. He explained in a low voice that Mr Proud's indisposition was a sudden attack of heart trouble, which he hoped the Duke would be kind enough to pardon.

'Dear! dear!' commented the Duke. 'Heart trouble! There are so many causes for that, some not so bad as the others. Perhaps he had a little something risky at his luncheon to-day which did not agree with him—eh?'

'It is possible, sir,' assented the young man. The Duke's affability was designed to set him at his ease, but did not seem to have that effect; and no more words passed until the Duke's imposing figure in shirt-sleeves was at his disposal, in front of a large mirror.

'We must get through it sharp, my boy,' said the Duke. 'I have not so much time to spare for these vanities as I thought.'

But the modish young tailor was clumsy rather than quick. Indeed, he had taken only two measurements, and recorded them, when the Duke seemed struck by the reflection of his embarrassments in the mirror. He noticed a glance as of extreme shyness which the young man cast at Hans the valet, who stood by the mirror, sentinel and critic in one. The young man's hands shook, and this also the Duke noticed.

'Concern yourself with something somewhere else, Hans,' he said in compassion for the young tailor.

But scarcely had the valet betaken himself to another part of the room when a strange premonition of evil stole upon the Duke.

'If you will be so good as to turn just a little to the window, sir,' entreated the young tailor huskily at that moment.

The Duke did so, mechanically, and thus faced away from the mirror. He did not, of course, associate this bashful young tailor with the mysterious feeling that had come upon him; but, as it chanced, his chin itched and he raised his hand to it just in time.

His struggle with the strangler was brief and silent, but fierce. Hans, in the next room, heard nothing of it, and was without suspicions until his master called to him and nodded at the crimson-faced and now wild-eyed young man, whose arms were bound to his sides with the garrotte of bull-hide, garnished with ugly little knots, which had made its futile attack upon the Duke's windpipe.

'Lock the doors,' said the Duke calmly. 'There is no need for any scene. This poor boy'—

'What has he done? Is he mad, sire?' babbled the astounded valet when the Duke paused.

'Yes, that is it. It must have been a mad fit, or something, so that I was obliged to tie him up for his own good. Set a chair for him, and then lock the outer doors of the suite while I talk to him.'

'Talk to him, your Majesty!' echoed the valet incredulously.

'Do I not speak plain?' demanded the Duke, with a gleam of anger in his eyes. Himself placing a chair for the strangler, who collapsed heavily upon it, he pointed to the door that connected immediately with the corridor. 'It is better that you are outside, I think, for a few minutes,' he continued. 'Go and request Captain Von Enselsing to telephone to the Ambassador that I may be rather late with him this evening. But say nothing of this little affair to any one. And knock at the door when you come back—in five minutes. Be off.'

The valet went without another word, and the Duke locked the door behind him and removed the key. From the dressing-room the Duke passed to the other rooms and secured their doors also. Then, still in his shirt-sleeves, he returned to the strangler, and with folded arms contemplated him in silence for two or three seconds.

'Surely you are not of the country—of Blenaria, my poor boy?' he asked then.

His tenderness seemed to have a composing as well as a compelling effect upon the strangler.

'I am a younger son of the Chieftain of Polp, sir,' he answered.

'Chieftain of Polp! Ah yes, that is the mountain province where they wear such remarkable dresses; where the men are so strong, and the women are, I remember I have heard, so beautiful! But you are of such an English

appearance, and you speak English—my faith, yes!—better than I myself do.'

'I was educated in Scotland; that is why, sir,' explained the strangler. His eyes had softened at the Duke's references to the people of Polp.

'So!' said the Duke, briskening. 'But this is very interesting. I had no idea of such a thing. And Messieurs Ponting & Proud employ you?'

'I'm not a tailor—saints forbid!' exclaimed the strangler in a burst of scorn. 'I have my medical degree in Edinburgh since two years. But I am a patriot before all, sir; and'—his voice sank—'why don't you send for the police and get it over?'

'The police—eh?' The Duke seemed to ponder the suggestion; but the strangler's face was averted, and his friendly accompanying smile was thus lost upon him. 'No,' said the Duke, 'that is not at all my intention.' He drew up a chair and sat down by the strangler. 'This is all too much like the improbable romances one reads in the magazines, my poor boy,' he added. 'See! I shall show you. I do not wish you to go to prison, or to suffer in any way, so young as you are; only to be sensible and a good boy in the future, especially as you are a son of that splendid old man of Polp whom I admire—from what I have heard of him—perhaps more than, as his king, I ought to do. You were not very sensible just now, you know, especially to think that a lad like you could choke a strong man like me and no harm come to yourself—eh? Although, mind you, I dare say you have a useful knowledge of the anatomy of a neck which would perhaps have helped you.' This gravely, yet ending with a quiet laugh, not at all ironical, while the Duke busied himself in untying the strangler's bonds. And then he stood up with the dangling garrotte, which he proceeded to coil round his left wrist.

(Continued on page 233.)

RAIN AND WIND.

THERE are certain outstanding crises in life that call upon us to summon up all our courage, to put on a smiling face if possible, and to laugh if we can. If there is any climax that makes laughter rather difficult and the business of life rather monotonous, it is an almost perpetual downpour. One soaked overcoat is already smoking on a rail before a fire that finds a difficulty in burning, as the wind has made the chimney-draught rather free; and the other is being removed, wet through, from our back. The wind is roaring like a fiend, and taking perfect leaps at the eaves and spoutings, mercilessly whirling any loose spray of ivy capable of being detached from its hold on the wall. The

ivy is a brave soldier, but it has sometimes to yield. A pool at the rear of the house is full; and, albeit there is a sandy base for it, it continues full, being continually fed from the heavens. The west is dark with blinding sheets of rain—avalanches, as it were; and great splashes are driven against one's face, the while the hat-brim becomes a veritable waterspout. Inside, in one's room, the sashes are shaken up and down violently, and the present-day cry for 'open windows'—a proper cry, too—has to be disregarded. And yet the earlier blossoms are out in great masses—snowdrops in the garden and celandines at the hedge's base. The colts-foot-flower shines in the furrow, and the little

hazel catkins are sadly shaken—bearing it all, however, with a wondrous tenacity. Nature's so-called 'weak things' are stronger than we think. But one must feel intense pity for that early lamb out in weather that would try an older flock.

Rain changes the whole aspect of thought and of life. We really wonder how many splendid poems have failed to reach maturity in cold northern climates like our own. It is true that philosophy can always be cultivated; but philosophy is, like duty, a cold, or, rather, a cool, thing at the best; it has no brightness, no delightful vagabondage about it—is just philosophy! It is simply trying to swallow a nasty pill which has not got a sugar-coating. At all events there is a possibility that many stirring strains and many fine romances have failed to reach an eager crowd because of rain; it is possible that many splendid mechanical inventions have been lost also; and it is more than possible that even suicides may have been helped forward. We trust that we are 'out' in this last conjecture; but we are certain that fairly good tempers have been made into the snappish order, and that in days of rain trifles are manufactured into 'mountains.'

The aspect of nature is desolate in the extreme. Every twig is dripping, each with its own note, and each little bud carries its own separate load. It is true that the buds gleam—that is, if the sun comes out; it is true that the grass is greener than in time of drought, a cold greenery that makes one shiver at its very mention. The only available consolation at such a period is the fact that we are on the threshold of spring; that no shower can last for ever, though showers may last for days—ay, even a week at a stretch; and that the floral army is gathering its forces at the command of the vernal queen, whatever the weather may be.

Rain has the effect, it is true, of causing a good deal of gossip all in one key. It generally begins with, 'Did you ever see such weather?' and ends with, 'Wretched. I call it miserable.' The farmer's ploughing has yet to be done, to a large extent; and the ploughman on the furrow is scarcely discernible as he urges forward his smoking team. The tails of his coat are tied, and they bob up and down like the sign of a pawnbroker in a gusty street in winter. He is wrapped in a glittering oilcloth that shines from the distance, and half-a-field away one can hear the merciless slashes of the monster rain.

There is one sublime image in the poems of Shakespeare which we fancy will live for ever; it is where the 'winds' take 'the ruffian billows by the top.' He pictures the ship-boy sleeping in such a turmoil, and perhaps he is right. One may possibly sleep soundest when the winds are rioting, but not when winds and rains combine their forces. Outside of our own dormitory is a

tank receiving water from the spouting. It has three keys in its harmony. The first is a raging major note when the tank receives the first roof-overflow; the second is a dirge-like minor when the vessel has been filled, and is venting its overplus through the waste-pipe; the third is the monotonous *gurgle, gurgle* of the rain that has been let out, and that almost chokes the drain. For weeks scarcely a night has passed without these notes being regularly and faithfully played. The only variation occurs when one hears a loud *whoosh* as a falling strain is sent flying right away from its destined path by the sheer force of the tempest; and this occurs pretty frequently. When the turmoil subsides, how gently sleep descends, but in a northern climate it will not be for long!

Rain in the country has, it is true, certain attractions, for in the lull of the shower, in this earliest springtime, it is possible to see a black-bird with 'flute of gold' walking about the gardens and dreaming of his ready music which will soon make homeland and spring a place of enchantment. Starlings also are about; jack-daws too, and the ever-resonant crow. What should we do without the black-coated brigade of the bird-world—fearless, perky, neat, and adventurous? In the town street the gutters run; the centre of the pavement only is available if one tries to save the neck from a gratuitous bath; the letters you carry to the post-office are either receiving the deluge in your hand or are stuffed into a wet coat-pocket. The pillar-box is trembling with drops, and if that kindly message reaches your friend half-sodden and almost undecipherable you may lose a friend, and never gain his ear again. This is where 'trifles' make up the 'sum of things'! The pedestrian's umbrella is perchance carried too low, and its load is heaved into your eyes or down betwixt your coat and collar; the man you are about to pass may be blinded by a sheet of rain, and a collision not of the gentlest is a possible result. These are some of life's questionable 'joys' in a city.

Betwixt tall hedgerows, on a country road—but, alas! road-contractors and surveyors are now insisting on farmers cutting their hedges lower—it is sometimes possible to find a friendly gap with an overhanging tree capable of defending one from a fierce squall. If, however, you do not run out directly on a cessation of the rain, you will get the whole collected mass inside your collar. We have many memories of deluges of this kind, and they are not sweet reminiscences either! Perhaps the worst thing about tempest, wind, and rain in general is that one can find no object to grumble at. One knows that trials are in the human lot, and that this is just a natural, universal chastisement—universal, at least, in climates that are not tropical or semi-tropical. There is nothing and no one to grumble at, and this is hard on the average Britisher, for he does

love to apportion blame, dealing the arrows of his wrath in some definite direction. 'Bother the rain!' is as far as he can get in the instance under our heading. Perhaps the strangest effect of heavy winds and rains that 'cut like scythes' is the horrible disfigurement of the humans who cross your path. There is a noted poem, 'The Demon Ship,' in which gigantic terrors and 'baleful shapes' haunted a man who had been picked up by the crew of a coal-carrying vessel. When he realised that it was the *Mary Anne* of Shields, and that the devilish-looking crew were only workers amid coal, how his heart must have bounded with joy! That figure, wrapped in oilskins, with rakish down-turned sou'-wester gleaming in the street-lamp of a winter's evening, what a gorgon he looks! We have heard of the 'headless horseman,' but never of the headless pedestrian! There is one, however; for the oilskin coat is not on, but over his sleeves, and the neck of it is pulled over his head. All that one sees is a soaking, glittering bulk heaving forward. His eyes are just visible, and that is all. To your statement that it is a 'wet night'

—for one *must*, however it comes, communicate a fact that all know too well—he gruffly answers, 'Yes;' and surely there is something like murder in those eyes. He is too wet and miserable to want any speech with us, and we have been so uncharitable as to force our speech upon him. Are we not thoughtless, oftentimes, in this direction? It is, we aver, impossible, for a man who is wet to be sociable, and we should bear our own burden 'in silence and alone.'

This article would not be complete, however, without something of *real* philosophy. A sailor who had been much in hot regions, where blue and unclouded skies were the rule, and rain the exception, said, as he saw the gutters of London pour, 'Confound your blue skies! Here's something like weather.' 'Home' was 'home, sweet home' after all; and perhaps, had any one of us to pass a year beneath cloudless skies, walking daily on burning sands, our sigh for rains, winds, and tempests would go out very heartily indeed. Ever we sigh for what we do not possess; ever do the 'distant hills look green.'

THE BRIGHT EYES OF DANGER.

By JOHN FOSTER, Author of *On Old Speyside*, *The Bernardine*, *The Ship of Shadows*, &c.

CHAPTER XV.—IN WHICH I TAKE A HAND AT ÉCARTÉ.

EVIDENTLY the game was not an ordinary one. None of them had time to give me more than a glance, so intent were they on watching the luck of the cards. They were playing écarté. The man with his back to me dealt. He looked at his hand, and said, 'I chance it!' The other man nodded, and led into the dealer's suit, but lost every trick. He rose, opened the door, and shouted, 'House.' I took advantage of the lull and craved pardon for my intrusion.

'Gentlemen,' said Irving, 'this is Mr Edward Layton, who has honoured me with his friendship. We travelled from the Border together. —These gentlemen,' he added, turning to me, 'were kind enough to invite me to play; but as I have no skill at the cartes, why, they would have me join them at the claret.'

'And you will join us too, sir,' said the other spectator of the game; 'for this is a right joyous week, the forerunner of glorious days.' He was standing by the fireplace, a fine figure of a man, with a great hearty voice. 'More claret, lass!' he called to the wench.

I gave him thanks, and he plunged at once into talk of the success of Charles Edward's arms. There was never a doubt in him about the outcome. Johnnie Cope would be driven into the sea, he said.

'Ye see, Mr Layton, the tartan has never had a fair upstandin' trial wi' the redcoats.

The "Fifteen" was badly handled, but 'twill be a different story this time. I am Colin Cameron, major, and these my friends Patrick Maxwell and Ronald Murray, captains in his Royal Highness's army.'

I bowed. Luckily the claret appeared at the moment, and I was saved the necessity of telling him that I differed from him and his friends in politics.

The two card-players turned to the table, and the cards flickered again. The younger of the players, Murray, looked a good-natured booby, his round face flushed with claret, a complacent little smile set on it. But, booby or no booby, he had the fortune of the cards. He won trick after trick. The pile of money on the table at his elbow grew steadily, while his adversary's dwindled and dwindled. The game went on for a time, in a silence broken only by the flutter of the cards and the tinkle of the money passing. His opponent was as unlike him as can be imagined. A clean-cut face, deep-set frank blue eyes, with a poise of the handsome head as he watched the cards that I was taken with against my will, for I was chary of gamblers and gambling. The man's eyes burned as they watched the cards. Not a muscle of his face moved. But for the blue sparks of his eyes I would have put him down as a man of ice; a Ferrara blade, handsome and keen, but cold. I am older now, and would as lief

judge a man by his shoe-buckles as by his face. My heart warms for him to this day; for, although Patrick Maxwell was a gambler born—and gambling has the heels of any vice for stealthily sapping a man's honour—he had as clean and kind a heart as any of the gallant breed whose name he bore.

The game went steadily against him. Time after time, looking at his hand, luck seemed to be with him, only for him to discover that his opponent held better cards, and that the little heap of coins by his elbow was rapidly lessening. The three of us watched silently, until the last coin crossed the table to Murray. Maxwell rose suddenly with a great oath and a dry, mirthless laugh, a laugh that his eyes had no share in, and lifted his glass.

'Luck's with the novice!' he said. 'I'm picked as clean as a dog's bone.—The devil has backed you to-night, I'm thinking.' He strode to the fireplace, drained the glass, and stood for a moment there, the flame playing on his pale face. Then he wheeled round. 'I've nothing but my horse left. Come, another bout!'

'No, Maxwell; take heed. Not to-night,' interposed Cameron.

'Why not to-night? As well to-night as any other. For aught we ken, we may all be on the wrong side o' the heather one o' these days.' Maxwell looked at the scattered cards, and took a step forward. Invisible hands were pulling him towards them. 'To it again! The horse is worth thirty guineas.'

The youngster Murray hesitated. 'As you will, Patrick,' he answered at length. 'I have won enough, an' ye ken the luck's no' wi' you. But just as ye say.'

'Then I say "play." I'll let the tow gang wi' the bucket. I'll stake the horse at thirty guineas, and you'll be well mounted if you win him.'

Without a word the cards were shuffled and dealt again. Irving snuffed the candles.

'Let us end this,' said Maxwell suddenly, after a round or two, and named a stake that meant the end of his tether.

They played again, no one speaking a word. Maxwell lost.

Without hesitation, without looking up at any of us, he drew a ring off his finger and threw it on the table, with 'I stake this!'

'Not that, by Heaven! His Highness's ring! Take my word, Maxwell, ye are making a tryst with blacker luck than ever ye can conter if ye stake that,' said the major earnestly.

'Well, well, fortune here, fortune there!' Maxwell turned the ring round and read from it '*Tanlem Triumphans*.' 'It is the Prince's motto, and is not his Highness in the greatest gamble in history?'

'Please God, no!' said the other.

Maxwell hesitated. Now, I know not what strange impulse urged me. He had lost every-

thing, and deservedly, I thought. I had little taste for play; yet, before I knew, I leaned forward and said, 'If you do me the honour, I shall play. But I name the terms, as I am no card-player. We play for an hour—that is, until half-past seven of the clock.' Then I named a sum high enough, as I thought, to set against the ring.

'Sir, you are generous,' he made answer; and with a gamester's superstition, 'Money will not buy the ring. The Prince gave it to me with his own hand. But it will bring me luck at cards. I take you!'

The other two officers shrugged their shoulders, as if to say, 'A wilful man has his way.'

I sat down opposite Maxwell, and again the cards whispered on the table.

I must say that the man was haunted by the hardest of ill-luck. If I played almost any card, he would follow with a worse. No one spoke, the ring winking in the candlelight in the middle of the table. We played on and on, until I was ashamed of my easy victories.

'Three minutes to go,' Walter Irving cried.

The cards were dealt. I had but an indifferent hand. Maxwell led into my suit. I won each trick. The clock struck the hour.

'You have the vole!' said my opponent calmly, and handed me the ring. He smiled, but he was pale to the lips, and his eyes played traitor to his brave attempt at unconcern. I could have sworn that for a moment their blue flame was dimmed.

'Nay! I played but to kill time,' said I. 'The jade Fortune has jilted you. I should be a churl indeed to claim what I hope will be a better talisman for other affairs than écarté. Allow me to restore it;' and I pushed it across the table.

He rose to his full height, a good clean-built six feet, the smile struck instantly from his face. 'You insult me, sir. The ring is yours. You offer charity, and to a Maxwell! By Heaven'—and his hand dived to his sword-hilt.

'My name is Layton;' and I got to my feet as I spoke. 'Like the Maxwells, the Laytons neither offer charity to their equals nor ask it from them. Come, Captain Maxwell, 'twas well meant. Keep the ring, and you shall still owe me the paltry guineas. I take your word for them, and I am within my rights. I do not know the custom in the North; but in Westmorland there is neither law nor custom that compels a man to accept money against his inclination, and I shall never be the first to introduce it.'

He looked long and earnestly at me. 'I ask your pardon, Mr Layton,' he said in a changed voice. 'I keep the ring—meanwhile. In truth—in truth—I was loath to part with it! But I shall not wear it until I repay you.'

He held out his hand and gave mine a grasp. It nearly made me wince, but it meant gratitude, and no second-rate flickering impulse.

It was a relief when the loud voice of Major Cameron broke in.

'Gentlemen, it looks like scant courtesy, but we must put foot to stirrup. I could bide here till cock-crow, with sound claret and the company of men like yourselves; but you can guess that we are due elsewhere. Our horses were ordered for seven o'clock, and the hour has gone long ago.'

We accompanied them to the door and saw them mounted.

Maxwell bent in the saddle as they moved off, and said, 'Remember, I do not wear the ring until I repay you.' He looked back and waved his hand as they rode round the corner out of sight.

'Come,' I said to Walter Irving; 'hast had any adventures since we parted?'

'Devil a one,' he answered, 'unless ye call colloquing with my kinsfolk by way of an adventure, listening to an auld wife's havers about her rheumatism and an in-come in her back, until I wearied, and came back to the town. There's nothing in Edinburgh but dis-peace and disappointment.'

'Ah, the lady! Is she still as coy as she is beautiful?'

'Coy or no', I'll marry her in a fortnight,' he said with great deliberation, and a new note in his voice.

'It would be a difficult business if the lady were not of your mind, unless you carried her off.'

'That's just what's in my mind, and it's what may very well happen. I'm tired o' courtin', and I'm thinkin' some women tire o' courtin' too, and would as lief be carried off as be made sugared speeches to.' He asked suddenly, 'Heard ye aught o' the numbers o' Cope's army?'

I laughed in his face; the change of subject was so palpable. As for him, he never looked to left or right, but glowered down the darkening street.

'You have not a great deal in the way of news,' said I.

'As much as you, maybe.'

'I doubt it. I'll tell you mine on condition that you keep it a secret.'

He looked at me, alert; another man in a twinkling. 'A secret?'

'Yes, a dead secret. Let us go back to the "White Horse." It is a long story.'

(Continued on page 227.)

BASSORAH, THE VENICE OF THE EAST.

By J. NIVEN.

THE Union-Jack having been hoisted at Basrah (also Basreh or Bassorah), a vision of my first visit there rises clearly before me; the atmosphere of the East seems once more to surround me, its indefinable charm to haunt me, and again in spirit I find myself nearing the land of the *Arabian Nights*. We had left the open sea behind when we reached Fao, where our soldiers landed lately. It consists of a few scattered houses on the edge of a level arid plain; but here the submarine cable which brings Persia and Mesopotamia into touch with the West is brought to shore, and at the telegraph station the news of events at home are ticked out, and then sent on to Mohammerah, Ahwaz, Basrah, and Baghdad, to be eagerly read and discussed in all the little communities of Europeans stationed there.

There is a great bar here, formed by the shifting bed of the Shat-el-Arab, as the waters of this swift-flowing river rush down to meet the sea, and the steamers are partially unloaded before they continue their journey up-stream. The Shat-el-Arab is a broad and turbulent river, formed by the confluence of the Tigris and Euphrates. At this part it forms a sort of natural boundary between Turkish Arabia and southern Persia. As we enter it, the banks are bare and uninteresting; but soon signs of cultivation appear, and a fringe of palm-trees borders the wide expanse of desert which stretches away toward the horizon. These gardens become more frequent as we near

the junction of the Shat-el-Arab and the Karun River. Here lies the town of Mohammerah, which only a few years ago consisted of a mere cluster of traders' houses and a British consulate, grouped together on the outskirts of the desert, with a wharf on the river-front. This wharf was generally piled high with boxes and bales, waiting the arrival of the little shallow-draught steamer that sailed once a fortnight for Ahwaz, a small town which is situated farther up the Karun, and which is the forwarding station for goods destined for Shuster, the Bakhtiari Hills, or Ispahan. At Ahwaz these goods are transhipped to a still smaller stern-wheel steamer, or loaded on mules and camels, and are carried through ancient canals or over desert and wild mountain-passes to the cities of the plains. Now Mohammerah is quite an important and busy port, with offices belonging to the Anglo-Persian Oil Company, a dock for the reception of the heavy material required for the construction of the oil-refineries, and houses for the officials of the company. As we reach it the cry of the *muezzin* calls every devout Mohammedan to evening prayer. We lie here for a night, and as the short Eastern twilight passes swiftly into dusk we sit on deck and watch the myriads of stars appearing one by one in the deep blue of the tropic sky. As the winches cease whirring we become conscious of a never-ending chorus of sounds which had been inaudible during the pulsing life of the day. The deep, guttural croaking of thousands of frogs

forms a bass to the sharp soprano notes of the never-resting cicadas, and at intervals the long, melodious trills of the singing tree-frog ring out loud and clear above them all. This vibrating, pulsing fullness of life under the date-palms is enfolded in the brooding silence of the desert, which, we know, is spreading out beyond the belt of trees, into the wide unknown, 'baring its bosom to the stars,' in its vastness and its unchanging stillness like a great image of eternity. Yet ever and anon this brooding silence is broken in upon and shattered by the startling suddenness of a loud, discordant cry, the hopeless wailing of some prowling hyena, or the short yelping bark of a pack of jackals. There seems to be no rest anywhere in the tropic night save in the eternal heavens, which shed so clear and transparent a radiance over all that the feathery fronds of the trees, the stubby banks of the river, and the gleaming waves of the swiftly flowing great stream itself are spread out in clear detail before us. An Arab is standing at the prow of the boat, and his figure stands out in a clear silhouette against the background of the sky. His flowing cloak, his picturesque head-covering, his stately pose, and above all the rapt stillness of his gaze as his eye searches the wide desert spaces seem to bring to mind old half-forgotten tales of magic ships sailing through perilous seas 'to faerie lands forlorn.'

We go to sleep this night with the joyful feeling that we have at last reached the magic East, and have already a premonition of the spell which this land of wide spaces is fated to cast upon us; already we hear the first faint call of the desert, which rings for ever in the ears of those to whose heart it once has reached. We wake next morning to find ourselves under way, and are steaming slowly up-river toward Bassorah, whose name is already familiar to us as that of the birthplace of Sindbad the Sailor. At one time this was a very prosperous city, with a larger population and more extended commerce than Baghdad itself; but now much or all of its glory has departed, though it might outrival its former splendour if it were delivered from the oppressive rule of the Turk.

As we sail up, the river-bank on the left (or Arabian) side shows ever greater luxuriance of growth. Every half-mile or so canals are led inland, and these again break up into a network of smaller canals which serve to irrigate the soil. As the export of dates to America, India, Europe, and Britain is the chief source of wealth, we find that wherever there are canals there are also date-gardens. The umbrella-shaped foliage of the palms gives just the required amount of shade to protect any undergrowth from the fierce rays of the burning sun, which would otherwise scorch the tender shoots of the springing plants. The light thus filters through the fronds of the trees and falls in a soft golden radiance on a miniature forest of growing things: trailing

vines, whose clinging tendrils are led from tree to tree; the twisting fibres of the cucumber-plant, eagerly pushing their way along the ground; a luxuriant tangle of tomato-bushes; long trails of green sheltering the slowly ripening golden melons; delicately graceful pomegranate-trees, with great waxen bells of vivid crimson staining the soft green of the quivering leaves; apricot-bushes, leafless still, but covered with a cloak of snow-white blossoms; peach-trees, a miracle of loveliness, as their delicate pink blossoms glow in the softened rays of the April sun—all these make up the unforgettable vision of an Arabian date-garden.

As Bassorah itself comes into view the date-gardens become more and more numerous and more luxuriant; everywhere are signs of cultivation and care; and as we leave the broadest canal behind us we turn a bend in the river, and have our first glimpse of the houses on the front. These are the dwellings of the wealthy native traders and of the British residents; and a little farther on is the official residence of the commodore of the Turkish fleet, with a solitary Turkish gunboat anchored in mid-river in front of it. The houses here are built of native-made bricks, in the form of squares or oblongs, built round a central open courtyard, and most of them have wide verandas at the southern side. A few are covered with creeping plants and sheltered by trees; but as these serve as cover for reptiles and mosquitoes, most of the Europeans sacrifice beauty to comfort, and leave their houses bare and unlovely. Behind the houses are the date-gardens; and on the opposite side of the river stretches an unbroken line of desert, yellowish-brown and arid, and seeming to quiver in the hot, palpitating air. The river here is full of life and sound. Sailing-vessels from Mossul or Baghdad, with sails so set that they seem like gigantic butterflies, and great carved prows rising high out of the water, remind us of the Viking ships of the old Norsemen; bellums, the native rowing-boats, glide past to the rhythmic cadence of the oars; one or two tramp-steamers are loading or unloading cargo; the lighter ships are preparing to steam to the bar to meet the incoming mail-boat; and the shallow-draught steamers which sail to Baghdad are being boarded by dozens of Arabs, Persians, Chaldeans, Jews, Turks, who will soon have made a temporary home for themselves on the upper deck, where they will cook their food, sleep, eat, dress, and undress in the small space allotted to them during the five days' journey to the City of the Caliphs.

Bassorah proper lies two miles inland, and can be reached either by land or water. To reach it we get into a bellum, which is long and narrow, somewhat like a gondola in shape, and is generally painted in vivid colours, bright blue or green, or even red. In the centre is a mattress or cushion and two or three pillows, and

there is just enough room to allow two passengers to sit side by side. Each boat has three rowers, or bellumgees, picturesque figures wearing the usual Arab head-dress and long blue tunics which reach to their ankles. As we turn out of the river into the main canal, known as Busreh Creek, we have on one hand the military barracks and on the other the Custom House. The barracks is a large, rambling, ramshackle building of the usual native pattern, and is surrounded by a mud wall. As we pass the band is practising, and a strange medley of discordant sounds reaches our ears, for each man seems to practise his own part without regard to the others, and often without much regard to either time or tune. The Custom House is an ugly brick building, with a wharf in front. Here the luckless merchant must leave his goods for days, and often for weeks, till such time as a liberal application of 'palm-oil' may induce the officials in charge to examine them and impose duty on them. The hapless owner may consider himself lucky if his bags of flour have not been standing for days in some inches of water, or if his tinned goods have not shown a remarkable quality of mysterious evaporation.

As we glide into the creek we come upon a busy and characteristically Eastern scene. An endless stream of figures seems to move up and down the road which borders the canal, and which is the only 'road' in the district. In the vivid sunshine they move restlessly to and fro: Arabs on graceful Arab horses, Turkish soldiers on hard-paced hacks, lumbering vehicles drawn by wretched mules, hurrying coolies with bundles poised on their heads, black-robed veiled women, with long skirts trailing in the dust, and balancing bronze pitchers on their heads, and blind beggars groping their way by the aid of a stick. As we near the town the road abruptly ends, and houses rise sheer out of the waters of the canal. Some of the houses are overhung by wide-spreading acacia-trees, and are covered with creepers through which the bright blues and greens of the woodwork gleam in flashes of colour. But soon these—which are the dwellings of the native merchants—give place to bare and ugly brick buildings, the law-courts and the prisons.

Soon we reach the end of the creek, and on leaving the boat find ourselves in the bazaar, whose narrow, covered-in alleys seem dark and gloomy after the fierce glare of the sunshine outside. The paths are unpaved and full of holes and ruts, and are so narrow that foot-passengers have to stand close to the wall to let carriages pass, or to avoid the greasy skins on the backs of the water-donkeys which pass in seemingly endless procession, while the *bheesties* goad them on by means of iron-shod staves. On either side of the street are rows of shops, or, rather, of shop windows without any glass. Here the merchant sits amongst his wares, often

smoking a *kalian* (or water-pipe), ready to talk or to bargain as his customers may desire. As in all Eastern places, purchases take long to make; every *keran* (a native coin) has to be fought over and bargained for. The bazaar in Busreh is relatively small and unimportant, as the wealthier natives have their silks, embroideries, brass vessels, and leather goods brought down from Baghdad. After a cursory glance at the stalls of groceries, spices, vegetables, and tin wares, we pass from the dark lanes to the bright sunshine of the desert.

Some groups of reed huts (or *sareefas*) mark the outlying native villages; beyond them there is a narrow belt of date-palms, and beyond that a vast stretch of desert land. This land wants only adequate irrigation to become the granary of Europe. Sir William Willcox has said that the soil is even more fertile than that of the Nile Valley, and would repay cultivation even more generously. At present the natives find that it does not pay them to cultivate grain in any quantity, as the Turkish Government taxes the crops so exorbitantly, and may at any moment lay an embargo on their exportation. Remains of ancient canals, which must have been in use when Babylon was at the height of its prosperity, can still be found, and explain the one-time splendour and wealth of that city of the plains. But, waste land though it be, the desert is a joy to those who love wide spaces and 'winds austere and pure.' Even during the torrid heat of summer, when the thermometer stands at one hundred and twenty degrees Fahrenheit in the shade, a keen air blows here. But in the springtime it blows salt and fresh, as though it came over the sea, and conjures up for us a vision of blue seas and freshening breezes which sweep round our island home.

A gallop on the desert is a thing to dwell in one's memory for ever. The horses themselves feel the call of it, and become things compact of fire and swift exulting motion. Far on the horizon can be seen the silhouette of a long line of camels bringing in merchandise from Zobeir, the town lying out in the midst of the desert. As they move on with stately stride they seem like a flight of ostriches against the blue background of the sky. Here and there can be seen an Arab, with flowing cloak, on a richly decked horse; he breaks into a sudden gallop, and in a moment has become but a speck on the great endless plain.

When our horses are tired we walk them home through the date-gardens, where they pick their steps over the narrow mud-paths and date-tree bridges. There is a peaceful loveliness in this fertile growth after the vast emptiness we have left behind. A breath of sweetness is wafted from a distant bean-field, recalling memories of home; the sicklier perfume of the mimosa makes the air heavy and languid, the

scent of the myrtle speaks of purity and peace, and the orange-blossom sheds its rich fragrance on every side. There is no grass, but fields of *jet*, or clover, grow in prodigal abundance; the canal-banks are pink with roses, the mulberry-trees are bent under their load of fruit, and Nature seems to be casting her gifts in prodigal profusion at the feet of man, for it is April, when the sun is still a beneficent and life-giving power.

Under the rule of a just and well-ordered Government there would be almost no limit to the possible development of such a land as this. At present the European population—including British, French, Germans, Greeks, and Russians—numbers not more than forty or fifty; but with improved methods of communication, the power to build and irrigate, and the prospect of permanent occupation, traders would increase in number, and trade might be developed on a very large scale. The climate is exceedingly hot, averaging one hundred and five degrees in the shade during the five hottest months; but the heat is fairly dry, except in May and part of August, when the atmosphere recalls the inside of a steam-laundry. The winter and early spring are delightful, a time of brilliant blue

skies, keen fresh winds, and life-giving sunshine. There is no rainy season, and rarely are there dull skies or lowering clouds. The lover of sport can enjoy fair shooting, wild pig, snipe, wild duck, and partridges being found in abundance. There is a club-house where one can read the latest telegrams, papers, and magazines, or play bridge or billiards. Tennis and badminton, riding, rowing, walking, keep the residents 'fit.' Even golf can be indulged in, for a course has been marked off on the desert across the river; but unfortunately the 'greens' are very often under water, as the snows melt in the distant hills and the river comes down in flood. In winter picnics and gymkhanas on the desert bring all the Europeans together; and sometimes, when a gunboat is lying in the river, cricket and football matches are played. Life out here is a thing remote from the hurry and bustle of our modern cities. *Bacha* (to-morrow) is always time enough for Arab or Persian; no sound of shrieking engine or clattering car is heard as the soft-footed camels pace slowly over the desert sand, and the great carved Viking ships glide noiselessly on the bosom of the stream. One has time to think, to feel, to enjoy—to live!

A HOUSE OF DREAMS.

By MRS GEORGE SAVILE.

ONE of the pleasant memories that remain after a long sojourn in India is the cold-weather camp. At all times there is much to ensnare the fancy in camp life, and the change of scene from cantonments to the jungle can never be forgotten. To many, all over the world, the mere thought of camping out wakes a thrill in the heart, and there are also many who will even endure hardship to lead a gipsy life for a while; but in India, where all the arrangements are so well understood, and where everything is run on luxurious lines, it can only be a delightful existence. Besides, it stands for a holiday—no bugles, no parades or courts-martial, no balls, dinners, or parties; only freedom from restraint, and shooting all day and every day—'for men must work!'—with, in some places, a delirium of snipe, duck, and other wildfowl. For the ladies of the party there are riding and walking in the cool hours of the morning and evening, and for some of the more sporting ones shooting with the other guns. In the afternoons the long, slumbrous hours; the white circle of tents, so quiet and so peaceful; the evening stir of food being prepared on numerous camp-fires, each caste cooking for themselves, and the wreaths of their blue smoke rising through the trees. A breeze brings the acrid smell of smoke, blended with the smell of boiling grain—the horses' food; and, as it nears the time for their evening meal,

the soft whinnying of the ponies. Bullocks, clad in sacks, are lying ruminating over the cud, and some less happy are bringing water to the camp; herds of sheep and goats and cows pass silently by in a cloud of dust on their way home for the night; an emerald flash of parrots, as they fly screaming overhead; servants stand or sit about in groups—all component parts of a great moving picture that, once seen, lives in the memory.

Then the last day, when every one goes his way, and everything has to be gathered up and packed away in the bullock-carts, and sent on early in the morning, to have time to get to the next place before dark; my husband and I following later at our leisure in the pony-cart. Only one more *dāk* before cantonments! Next day we should be back again, after a month's leave, doing the usual round of duty and pleasure that makes up life in India.

At Minahpur, where we were to sleep the last night of our leave, there was an old Residency, long dismantled; the commission had been moved elsewhere, and the house was no longer needed.

We arrived to find all our carts congregated under big banyan-trees in the huge compound. Our servants greeted us with the questions, 'What orders? Will the sahib and the mem sahib sleep in the tents, or shall their servants make them beds in the bungalow?' The butler

added insinuatingly, 'Very good bungalow, sar.' I suspected him of laziness. I felt sure it was only to save himself the trouble of superintending the putting up of the tents, which he evidently considered a waste of energy for one night; moreover, he probably hoped to get in early next day to his wife and family.

It had been very cold in tents the night before, and the thought of getting into a house rather commended itself to me. 'Is it clean?' I asked.

'Yes, mem sahib; commissioner sahib just done sleeping there two, three nights.'

'Let us go and inspect,' advised my husband.

We walked across to the bungalow, a very fine one. The veranda at the back had been built up roughly and screened off into a series of small rooms, in two of which the perfidious Trim Bux had already put our effects. That he meant us to spend the night there was obvious.

'Why not inside, if at all?' I asked coldly.

Trim Bux fidgeted. 'Better here, mem sahib. Here commissioner sahib slept.' He was like a parrot, but his tone implied that what was good enough for a person in authority was good enough for a mere major's wife. He then added confidently, 'They tell—inside—a house of dreams.'

To my surprise, however, the dinner-table was laid inside—looking a small island in the huge dining-room that went all across the house. The house was in fair repair, though dismantled; but as I stepped across the threshold I disliked the atmosphere. A disused house in India soon takes on an eerie feeling; I have noticed it a score of times, and it is generally at once inhabited by cats, rats, and bats. I looked at the matting; it was quite new and clean. There seemed nothing to complain of that I could see, but I felt uncomfortable, and was glad to walk quickly through the equally huge drawing-room and out of one of the five great French windows that made the bow, on to the veranda beyond. Scraps of curtains of a gorgeous, though faded, blue satin hung before these windows; but why they had been left it was hard to say; they intensified the feeling of desolation. I glanced through the window into the best bedroom—a gaunt room, with the ceiling-cloth torn down in a far corner—and was thankful Trim Bux had not compelled me to sleep in that ghostly room! However, once in the garden, we—both ardent gardeners—were soon engaged in the interesting pursuit of tracing out paths and beds. It had evidently had a lot of work expended on it in the past. A broad walk led from the house to a balustrade at the end; on either side of this path were beds aflame with amaryllis lilies, making a brave show.

'I have never seen so many together before,' I said. 'How gay!' Then somehow I felt gaiety was the last thing to be said of that desolate garden, where departed glory brooded over everything. The long walks under shady trees were grass-grown; the borders round the

beds were hedges now. The rose-garden—so large and well laid out, with a fountain in the centre—had returned to type! Only the common red and pink Edward and Emma roses (on which the better kinds, in lieu of briers, are budded in India) remained in wild luxuriance, while all around the jungle undergrowth had crept up and was encroaching steadily.

After a pleasant hour of wandering round, we again came down the broad walk, and leant against the balustrade, which was on the edge of the plateau on which the house was built. Below us was a deep gorge, a forest of trees covering the sides of it from top to bottom. We amused ourselves tracing the footpaths made by the wood-cutters, as they wound through the thick jungle from the plain below.

'What a wild place, but how beautiful!' I said; but I shuddered.

The mists were rising from the valley, and it was getting dark. We were glad to go in to dinner; and it was surprising how soon afterwards we decided there was nothing to sit up for, and that it would be nicer to go early to bed.

But as I settled down to sleep I found myself repeating, 'A house of dreams! a house of dreams!'

There was a whispering close beside me in the veranda, an irritating, whispering sound. For a long time I could hear nothing; try as I would, I could not hear a word that was being said. At last one of the servants—oh yes! it was the native servants, of course—grew excited, and said aloud, 'Four sahibs come.'

'Hush!'

The whisperers were annoyed, but still continued to whisper, 'Four sahibs;' once I had caught it, I heard it again and again in their talk; and once the words 'commissioner sahib,' and somehow in connection 'pistol.'

Next I became suddenly aware of lights in the dining-room, and saw the table-servants moving about, laying the table for dinner. They took the usual minute care with the floral decorations and in putting on the silver and glass. What a lot of silver! It was evidently to be a large dinner-party. Still the servants muttered, 'Four sahibs,' as they talked in low voices, moving round the table as they did their work.

Finally all the candles were lit; the dinner-hour had come. It struck me suddenly that no company had arrived. The diners were presumably guests in the house. In the drawing-room a buzz of conversation arose, men's voices, and now and again a woman's voice, and a gay, high laugh. Presently round the screen of Turkey-red twill in its handsome carved black-wood frame—all details were photographed on my brain—that, Indian-fashion, divided the two rooms, came the host and three men with him. He was a tall, powerfully built man, in a white duck suit, with long, narrow trousers that added

to his height, and a buttoned-up coat, a high collar, and black tie. His dark hair was long and waved on the top and sides of his head, he wore side-whiskers of the type called later 'Dundreary,' and had a flowing moustache. His three friends were similarly dressed, the only difference being in height and appearance.

From the other side of the screen appeared the lady on the arm of a fifth man, the most curled and scented of the lot—an Apollo! She was looking up and smiling into his face and talking with great animation. She was an apparition worth looking at.

'By Jove!' said one of the other men to his neighbour; 'isn't she arresting, by Jove!'

She was clad, in the height of fashion of her day, in a flame-pink silk dress, cut in a long-waisted bodice, with a lace *berthe* and short sleeves, from which her lovely drooping shoulders and shapely arms emerged with dazzling splendour; her skirt, with its downward-sweeping flounces, was very full and wide, and 'stood up by itself'—the acme of praise in those days. It swept round her as she walked. Her fair hair was braided round her head in oval form, and a wreath of small flowers surrounded her piquant face. She was very gay and sprightly; her eyes gleamed; her red lips parted in smiles that revealed her pearly teeth.

There was much laughter and conversation. The hostess's sallies were well received and much applauded. The champagne was handed round so that the gallants could drink to her. The servants stood round with imperturbable faces.

'Stop!' cried the host, smelling his glass. 'This is corked. Don't drink it.—Boy, bring another bottle, here to me. I will open it. Do you hear?'

'Better be on the safe side,' he said *sotto voce* to the man at his side. 'Probably medicated. All the servants disaffected.'

The lady's voice arose. 'My ayah left suddenly to-day. She said she was ill, but I don't believe her; so I had to dress myself.'

'Beautiful, I am sure,' drawled her cavalier, bowing low to her. 'You know I think you prodigiously handsome.'

She tapped him with her fan. 'Maurice'—with a sibilant lingering at the end of the name—'helped me.—You will always help me when I need help, won't you, Maurice?' she lisped.

'Even unto death,' answered her husband in a deep, vibrant voice.

At that she laughed again, but a sudden fear dawned in her eyes. 'The natives are curious just now, aren't they? I was glad to be rid of my ayah. Last night she talked of nothing but death. Now you are doing the same thing, Maurice!'

The host's great voice broke in, while he glanced at the immovable black faces round him. 'Listen to what Mackenzie says. He knows a certainty for the Calcutta stakes.'

It was not considered wise in India at that time—the spring of 1857—to probe below the surface of things or to discuss the situation. The Europeans were not blind to the danger-signals, but they were afraid the slightest digression from their usual ways might fire the mine and bring about the catastrophe they dreaded.

When the conversation became general again the host said cautiously to the man on his right, while he still watched to see that no one was listening, 'I have kept it from her. Good of you fellows to come. I have sent for the Seoli Horse. When they come we shall be safe.'

His friend nodded. The wine circulated in silver 'coasters.' The reflection of silver and flowers on the shining table made a charming picture. The hostess was more brilliant than ever. She was strangely like the flaming lilies in the garden.

'Mohammed,' she cried, 'bring the sahib a light for his cheroot.'

Mohammed, standing in the doorway with his back to the room, was peering out into the night. There were sounds of arrival, orders given, a scuffle.

Mohammed turned round with an evil leer, and twisted up his moustache—a gross insult from a Mussulman.

The gentlemen sprang to their feet and drew pistols, which they all had concealed about them. Maurice came round to his wife and put his arm round her, while she clung in terror to him. 'Courage, dear! courage!' he whispered to her.

The next moment all was wild confusion. Shots were fired. A crowd surged in on them. The Seoli Horse had mutinied and joined the servants. '*Deen! deen!*' ('Kill! kill!'), cried the Mussulmans.

The Englishmen, who just before seemed such 'curled darlings,' stood together and fought like lions. England's enemies have always found it unwise to underrate her sons; but the odds were against them. They were outnumbered by ten to one, though many bit the dust before the brave resistance failed.

Maurice, with a sword he had taken from a dead sowar, was fighting desperately; but the end had come; he knew he could not hold out much longer. He turned an agonised face on his wife, who had swooned at his side. He had one thing to do before it was too late, and he had reserved one bullet for it. He put his pistol to his wife's heart and shot her dead as she lay.

Two hours afterwards all was silent in that awful room. A single lamp still shed a light on the ghastly heaps on the floor. All the silver and valuables had been taken; everything else was broken and trampled under foot. The dead—black and white—were lying crumpled as they had fallen. The mutineers had looted

the bungalow, and gone on to continue their devilish work.

A head arose from the *débris*, stared around, and listened. It was Maurice, still alive, but bleeding, terrible, scarcely recognisable. He crawled to his wife's side; a corpse had fallen between them. When he found her he lay still again. He was too tired to think or care. But as the dawn brought a degree of coolness he woke, gathered up the woman in his arms, and with great difficulty bore her through the drawing-room and down the broad walk in front. Slowly, slowly, with almost superhuman effort, he dragged himself and her down one of the jungle paths, until, hidden by creepers, he came to a cave in the rocks. There he laid her down at the far end, and prayed over his dead.

'Dead! dead!' he moaned. 'Oh gracious Father, in Thy mercy let me not live, now she is dead!'

With a wild scream I woke. My husband came running to me.

'What is the matter? What frightened you?' he asked, putting his arm round me; and I was as glad to feel it as that other woman must have been to have her husband's strong arm round her in her hour of danger; though, alas! it had been powerless to save her.

I sobbed weakly, like a child, 'I've—I've had a bad dream.'

He petted and consoled me, as I had often consoled my own little son in like circumstances. 'See, it is dawn. The servants are stirring; they are going to start for home now. All is safe. Lie down and go to sleep again.'

We breakfasted under the trees. I remember the crows stole the butter. I could not bear the dining-room. I was still oppressed by my dream, and was quite determined to search for the cave. My husband humoured me. I could see he thought I was obsessed, and the only way to cure me was to let me find out that, after all, it was but 'the fabric of a dream,' a man's way of knocking the bottom out of a woman's 'silly fancy.'

He called the *chowkeda* (caretaker) and questioned him. Oh yes, there were caves—plenty

—down in the jungle. Would we go and see?

We marched down a long way, and it was hot and stuffy in the wood. At last the caretaker stopped before long hanging roots of a banyan-tree that had become almost trees themselves, and pointed into a well-kept cave, evidently a show-place; and, looking hard at me, he began the oft-told tale: 'Here, sahib and mem sahib hiding in the Great Rising. Jungle people very kind, bringing food and water, and afterwards bringing sahib and mem sahib safely to cantonments.'

'This is too far down,' I said. 'Let us go back to the balustrade. They turned off sharp to the left,' I insisted.

Arrived at the top, we found a path, passing a tree under which was a native god painted vermillion. 'Yes, I saw that in my dream. Here! here!' I said excitedly, going to his left.

At that our friend confessed. 'Yes, here was a hiding-place. Sahib knew it and made ready. Villagers always wondering where he had taken lady, but my father knew. It was easy to find them. Sahib was weak and very faint; he fell often, and there was blood all the way. My father put mud over it to hide marks. He loved Binnington sahib. He would have helped him.'

'Was he dead?' asked my husband sternly.

'Yes, truly, sahib; both quite dead. Sahib and mem sahib together quite dead. My father putting stones before the place, and for a long time no one going in again. Now if any go in a devil comes and stops them; and when foot passes by at night mem sahib's spirit cries so loud men run away and hide their ears—so,' graphically putting his hands over his ears to show us how.

Later we verified the above facts. We found people living who had known them in the past. We had the cave walled up and a cross placed in front of it; and on it we had this inscription carved:

SACRED
TO THE MEMORY OF
MAURICE BINNINGTON AND LILIAS, HIS WIFE,
KILLED AT MINAHPUR, MAY 1857.
'In death they were not divided.'

THE GREATEST LIVING GUERRILLA.

By PERCY CROSS STANDING, Author of *Guerilla Leaders of the World*.

THE writer has been privileged to hold personal converse with the octogenarian Colonel John Singleton Mosby, one of the dwindling band of survivors, on the Confederate side, of the American Civil War of 1861-65. I am aware, of course, that in venturing to describe the veteran Mosby as the greatest living guerilla leader I may have to break a lance with those enthusiasts who would fain claim such a distinc-

tion for the unheroic General De Wet. But that erring soldier, Christian de Wet, has so passionately declaimed against the description 'guerilla' as applied to himself, in his remarkable book, *Three Years' War*, that I have deemed it well to omit him from the comparison.

The exploits of Colonel Mosby were responsible for one of the most celebrated of President Lincoln's many *mots*. On the occasion of Mosby's

capturing the Federal General Stoughton and a number of horses in the course of an exceptionally daring raid, the President dryly remarked, 'Well, there won't be any difficulty about making another General, *but how are we to replace those horses?*' And the dashing colonel once got so close to Washington—in sight of the Capitol, in fact—that he cut off a lock of his hair and humorously requested a passer-by to convey it to Mr Lincoln with his compliments. 'But the exchange was never effected.'

Like so many thousands of others, John S. Mosby entered the service of the Southern Confederacy, on the outbreak of the Civil War in 1861, as a soldier in the ranks; but his merits were speedily recognised by General R. E. Lee, the famous Confederate Commander-in-Chief, in an Order of the Day. Promotion followed, and he became attached to the cavalry corps commanded by the chivalrous J. E. B. ('Jeb') Stuart. The latter was quick to recognise the young officer's extraordinary merits, and he encouraged Mosby in the direction of a series of daring raids upon the enemy's railroads, lines of communication, &c. Nevertheless, in a letter to the present writer, the veteran partisan says: 'My command never consisted of more than two or three hundred men.'

Early in 1863, the third year of the war, Mosby was promoted captain, when he decided to justify his promotion without delay. What immediately followed is perhaps best told in his own picturesque language: 'It was on 7th March 1863 that I started from Aldie with twenty-nine men. It was pitch-dark before we got near the enemy's cavalry pickets at Chantilly. Here a good point was won, for once inside the Union lines we should be mistaken for their own men. We passed along close by the camp-fires, but the sentinels mistook us for a scouting party of their own cavalry. I had no reputation to lose by failure, but much to gain by success. I remembered, too, the motto that Ixion in heaven wrote in Minerva's album, "Adventures are to the adventurous." There were a few guards about, but they did not suspect us until they saw a pistol pointed at them. Of course they surrendered. Some even refused to believe we were Confederates after we told them who we were! Joe Nelson rode up to me with a prisoner who said he belonged to the guard at General Stoughton's headquarters, and with a party of five or six men I immediately went there. An upper window was raised, and a voice called out, "Who is there?" The answer was, "We have a despatch for General Stoughton." An officer (Lieutenant Prentiss) came to the front-door to get it. I caught hold of his shirt and whispered my name in his ear, and told him to lead me to the General's room. As resistance was quite useless, he did so. A light was struck, and before us lay the sleeping General. He quickly raised himself up in bed

and asked what this meant. I said, "General, get up; dress quick; you are a prisoner!" "What?" exclaimed the indignant General. "My name is Mosby. Stuart's cavalry are in possession of the place, and Jackson holds Centreville." "Is Fitzhugh Lee here?" "Yes." "Then take me to him; we were classmates." "Very well; but dress quickly." My motive in deceiving him as to the amount of our force was to deprive him of all hope of rescue. I turned over my prisoners to Stuart at Culpeper Court-House. He was as much delighted at what I had done as I was, and he published a General Order announcing it to the cavalry, in which he described it as "a feat unparalleled in the war."

No wonder that President Lincoln, seated at the dinner-table, is alleged to have lifted up the corner of the tablecloth and looked anxiously under it. 'I'm looking to see if Mosby is underneath,' the President humorously explained.

The rival President, Jefferson Davis, received the news of Mosby's daring capture of General Stoughton in the following terms from the Confederate Generalissimo:

'You will, I know, be gratified to learn by the enclosed despatch that the appointment conferred a few days since upon Captain Mosby was not unworthily bestowed. The point where he struck the enemy is north of Fairfax Court-House, near the Potomac, and far within the lines of the enemy. I wish I could receive his appointment as major, or some official notification that I might announce it to him.

'R. E. LEE, General.'

The enclosure ran as follows:

'CAPTAIN,—Your telegram announcing your brilliant achievement near Chantilly was duly received and forwarded to General Lee. He exclaimed on reading it, "Hurrah for Mosby! I wish I had a hundred like him." Heartily wishing you continued success,

'J. E. B. STUART, Major-Gen. Commanding.'

A few weeks later came the first big nail in the coffin of the Southern Confederacy, the death of that supreme genius for war, Stonewall Jackson, in the arms of victory at Chancellorsville. In July of the same fatal year (1863) followed the fall of the fortress of Vicksburg and the Waterloo of Lee's army of northern Virginia on the bloody field of Gettysburg. It has been said that the primary cause of the loss at Gettysburg was the absence of the whole of the Confederate cavalry on a big raid around the enemy's lines of communication; but Colonel Mosby has combated this view in an elaborate and fascinating volume entitled *Stuart Cavalry in the Gettysburg Campaign*. Characterising the story as a myth and a 'Gettysburg legend,' the veteran adds: 'As I myself brought the information that induced General Stuart to ask permission to pass the Potomac in rear of the

enemy, and was selected to command the advance of his column, I think I have a right, as an actor in the great tragedy, to be heard.'

The knightly Stuart himself fell in battle near Yellow Tavern, Virginia, on 11th May 1864; and on 4th September ensuing General John H. Morgan—Mosby's only possible rival as a great Confederate guerilla leader—was shot dead at the battle of Knoxville. Still fighting with the courage born of despair, however, Colonel Mosby evoked from one of the opposing commanders this flattering (?) encomium on his capacity for war: 'Mosby is the devil. There will be no peace till he is killed.' In one of his later raids he only just fell short of capturing General Grant himself; and what would have been the moral effect of taking prisoner the Federal Commander-in-Chief at such a juncture of affairs may be better imagined than described. Grant subsequently wrote about him: 'Since the close of the war I have come to know Colonel Mosby personally and somewhat intimately. He is a different man entirely from what I had supposed. He is slender, not tall, wiry, and looks as if he could endure any amount of physical fatigue. He is able, and thoroughly honest and truthful. There were probably but few men in the South who could have commanded successfully a detachment in the rear of an opposing army, and so near the border of hostilities, as long as he did, without losing his entire command.'

After the Gettysburg disaster, Mosby was despatched at the head of his dwindling guerilla band to oppose General Phil Sheridan—the Stuart, so to speak, of the Northern army—who was laying waste the fertile valley of the Shenandoah. He must have given Sheridan many sleepless nights, for the latter writes of him: 'Mosby was the most formidable partisan I met in the war;' and this although Sheridan had also fought against the not less celebrated Morgan and Forrest. Grant wrote to Sheridan while Mosby was harassing his communications: 'If you can possibly spare a division of cavalry, send them through Loudoun County to destroy and carry off the crops, animals, negroes, and all men under fifty years of age capable of bearing arms. In this way you will get rid of many of Mosby's men. All male citizens under fifty can fitly be held as prisoners of war, not citizen prisoners. If not already soldiers, they will be made so directly the rebel army gets hold of them. Give the enemy no rest. Do all the damage to railroads and crops you can. Carry off stock of all descriptions, and negroes, so as to prevent further planting. If the war is to last another year, we want the Shenandoah Valley to remain a barren waste.'

That smiling valley did become 'a barren waste;' and, as the awful contest grew more and more embittered, Colonel Mosby was declared an outlaw by the Federal authorities and a price

was actually set on his head! Nevertheless, the veteran has emphatically and successfully combated the suggestion that he was ever guilty of contravening the laws of civilised warfare; and it speaks volumes for his own Commander-in-Chief's opinion of him that after the capitulation of the army of northern Virginia in April 1865, General Lee invested Mosby with the direction of what remained of the military forces of the Confederate States until the final termination of hostilities.

Old wounds and rancours were healed, and long years after the Civil War, when Mr Roosevelt went to the White House as President of the United States, he invited John S. Mosby to join his administration as head of the United States Department of Justice. In this connection Colonel Mosby writes amusingly to me that he eventually went out of the administration and back to private life 'because I opposed the Indian "steal"'—that is, the drastic measures of the United States Government when 'acquiring' the Red Indians' territory.

I conclude my appreciation of this incomparably Grand Old Man of guerilla warfare with a brief extract from the eulogy of his prowess penned by Colonel Henderson in his magnificent biography of Stonewall Jackson: 'These [Mosby's] operations are brilliant examples of the great strategical value of a cavalry which is perfectly independent of the foot-soldier, and which at the same time is in the highest degree mobile. Those who have never had to deal with the communications of an army may be unable to realise the effect that may be, and often is, produced by such a force; but no one with the least practical experience of the responsibilities of a Commander-in-Chief will venture to abate one jot from the enormous strategical value assigned to it by American soldiers. The horseman of the Civil War is the model of the efficient cavalryman.'

COULD WISHES MAKE THY PATHWAY.

COULD wishes make thy pathway lie

By silver streams through sunny meadows,
Keep o'er thy head an azure sky,

And from thy path all shades and shadows;
Then, love, thy heart no care should know,

Thy pathway lie in pleasant places,
And wheresoever thou didst go,
Thou wouldst discover well-loved faces.

But human minds in life's stern school,
And human hearts in stress and striving,
Must learn to conquer and to rule
Themselves, before at rest arriving.

So I, my love, can only pray

That in all sorrows that betide thee,
And howsoever dark thy way,

That God will keep and guard and guide thee.

LUDOVIC LITHGOW.

Chambers's Journal

SEVENTH SERIES

EDINBURGH UNDER ARMS.

By J. C. BRYDEN.

THE cold wind sings through the coarse gray grass of the Braids; the gulls float slowly over the spires and trees of the town; the old gray city by her leaden strip of sea seems to smoke as quietly and calmly as in her stillest years of peace. And yet it is not really so. Once more her grim old Castle looks down on armed men, the challenge of the sentry is heard in her streets at night; and, even as we look, a long thin snake of khaki winds slowly down the hill and is lost away among the gorse. Edinburgh is under arms yet again!

If it is true that familiarity actually breeds contempt, then never was there city better qualified than Edinburgh to look on these martial scenes with indifference and calm. From the time of earliest history till the days of the 'Forty-five,' she has met and met her enemies again and yet again. Indeed, till 1375, the incursions of the English were so numerous and common that little was built of stone; and just a few poor little dwellings formed of earth and thatched with reeds clustered closely round the Castle and the base of the Castle Rock. It was useless to build substantially when any night the bale-fire's gleam might give the dreaded warning of the enemy's approach, for the citizens never hesitated to make a Moscow of their city whenever they were assured of the English host's advance; but by the light of their burning houses they would shoulder their few poor goods, and, driving their cattle before them, seek the shelter of the hills.

The exodus of these citizens, ancient history though it is, must have strikingly resembled what Belgium can show to-day; for, difficult as it is to realise it, there can really be no doubt that the civilians, then as now, had little to do with war. But though a surprisingly small part was taken by the citizens in most of the besiegings that went on within their town, it was often a townsman's brains, and not infrequently his daring, that forced the Castle's garrison to surrender or seek for terms.

This was particularly the case in the days of Robert the Bruce, when the castles of Stirling and Edinburgh alone held out for England. For many nights and days Sir Randolph, first Earl of Moray, had laid siege to Edinburgh Castle, which still defied him from its Rock, when at length one William Francis, an inmate of the town, proposed

a daring scheme which seemed to promise some success. As he was the son of a man once keeper of the fort, it appeared that this William Francis had lived within the Castle, and that during his stay on the Rock he had fallen violently in love with a certain doubtful lady who dwelt within the town. The frowns of the father being all against the match, he curtly forbade his son ever to see the lady again; but the stalwart William Francis, though a dutiful son by day, did not always obey his parent during sentry-go at night. With the incredible daring of youth, and at risk of his life and limb, he would scramble down the precipice in the heart of the darkest hours; and, having visited his lady, and taken a sweet farewell, would coolly reascend before the winter morning broke.

Such a marvellous feat of skill, as this climb undoubtedly was, must have seemed as impossible then as it seems impossible now, yet the dauntless Earl of Moray, and thirty men besides, resolved to attempt an assault by this terrible ladder of love. The night which they chose for their venture was black as any soot; but, despite this and their armour, which was heavy, cumbersome mail, they duly began the scramble up the rocks overhanging Princes Street Gardens, with Francis as their guide. The cliff was steep and high, but with infinite pain and toil they managed to reach a jutting ledge some half-way up the Rock; and there they paused to rest, while from the blackness far above them they could faintly hear the coughing of a sentry at his post.

Suddenly there was a shout, 'Away; I see you well,' and an enormous block of stone came thundering down upon them, leapt past them, and was gone. By what seemed to be a miracle, not one of them was hit; and by a superhuman effort each refrained from crying out. All that broke the stillness was a cough and a stifled laugh as the sentry on the rampart enjoyed his silly joke. He had only launched the boulder to frighten his fellow-guards.

Once more the brave attackers began to ascend the cliff, and at length, though all but exhausted, and bleeding from many a scar, they managed to reach the summit and overpower the guard. The fight that then ensued was fierce in the extreme, but the surprise was too complete for the issue to be in doubt, and as the March sun rose

the standard of England fell, leaving Edinburgh Castle in Scottish hands once more.

It is interesting to contrast this method of attack with that which was employed when cannon came into use; to contrast the deeds of Randolph with those of Regent Morton when he strove to take the Castle in the days of Mary Stuart. Though cannon had been known long before Queen Mary's time, though we read of how at Cressy the archers set between them a number of little bombards 'to frighten off the horses,' and though we know that by 1330 strange mortars had been wrought, some of wood bound round with metal, and even some of leather, it was not till the sixteenth century that guns were recognised as the most terrible of weapons that man had ever used. Before 1573 the Castle had been held during more than two long years for Mary Queen of Scots, and the exasperated Morton, who was then in charge of the siege, was forced to apply to England for cannon to reduce it. At length the cannon came, some twenty lumbering pieces, with many arquebusiers and pikemen in their train; and no time was lost in setting up the batteries, one of which was planted in the churchyard of Greyfriars. On the 17th of May the bombardment itself began; and though much had been expected from such large and powerful 'engines,' every one was appalled by the havoc which they wrought, and by the night of the 24th the Castle was in ruins, a melancholy example of the power of cannon-balls. The Wallace Tower and David's Tower, the Great Gate and Portcullis, were reduced to crumbling heaps, beneath which many men lay buried, and the remainder of the garrison, with all their bravery, were too exhausted and defenceless to do anything but surrender.

That Scotland was not always without cannon of her own, though at this memorable time she had to call on England, and that she did not always scruple to extort such from her people, the following curious Act will do very well to show:

'That landed men, and others, provide Guns: for each hundred pounds of land of new extent, one Hagbut—a terrible little arquebuse which took fifteen minutes to load, and which always prostrated its owner whenever he let it off; 'for each hundred marks of land, two Culverings'—an early form of cannon weighing a couple of tons or more, and capable of throwing a ball of eighteen pounds; 'and for each forty pounds of land, one Culvering, with all its pertinents. And that Merchants bring them home.'

But in order to ensure that none of these fearsome weapons should be used in any 'bicker' that might bring danger to the State, another law was drafted and soon brought into use by James the Sixth and his Parliament:

'That no man shoot with, or wear guns under penalty of cutting off the right hand; except that men may shoot for Pastime within their

inner closes . . . or in defence or pursuit of Thiefs.'

In the days of the Covenanters the methods of defence employed to defend the city from the 'fireworks of the Castle' were simple, and so effective that the town knew little 'scathe.' They simply took all houses that faced the Castle Hill and filled them with sand and water to stop the cannon-balls, while on the causeway of the streets 'they raised midding mounds, and on ilka mound ane cannon was stellited with all due care.' But if the town knew little 'scathe' from the fireworks of the Castle, the Castle knew as little from the guns of the 'midding mounds,' for it is authentically reported that a shot fired from the city missed not only the Castle, but the Castle Rock as well. In fact, so surprisingly ineffective were their 'modern contrivings'—though one of them was a mine which made a good-sized breach—that the canny Covenanters only gained the Castle at length by starving out the garrison by means of a close blockade.

A much more serious matter was the mine in Cromwell's time, for, with the aid of the Lothian colliers, a tunnel of sixty yards was driven from the southward right into the Castle Rock, and the powder being placed and the fuse and match got ready, the garrison was summoned to surrender within an hour. As may well be imagined, the threat was quite enough, and before the hour was finished the Castle gates were opened, and, with honourable terms, the garrison marched out.

On the 5th of October 1745 the guns of the Castle spoke out yet once again—spoke out, please God, for the last time to an enemy, for never since that day have they shot a deadly charge. They seem very far away, those days of the 'Forty-five,' and gradually the Castle becomes more and more a relic, till now the time has come when naval big guns could pound it into powder in less than a winter's day. But as the use of forts grows less, the need for men grows more, till now we ask not thousands but millions to drill and arm; for, with stone and steel and concrete proved useless as bow and spear, we know it is men, and more men, that alone can save us now.

Even in 1456 the need of men was great, and every able man between sixteen years and sixty was expected to be ready to oppose the English host. Sixteen years and sixty! And now we talk of thirty-eight as the greatest age permissible for a man who volunteers. Nor was it thought enough for a man to give his strength; he had also to provide himself with 'ane pricked hat and ane jacket,' supplied (if that were possible) with 'sleeves down to the hand;' while for arms he must produce an axe, a sword and buckler, a bow with all its arrows; besides a horse, 'gif he can get it.'

To ensure that every man could actually bring

these things, and, bringing them, be capable of using them with effect, King James the Second and his Parliament made the following drastic law :

'Item, It is decreed and ordained that Weapon Showings be holden by the Lords and Barons Spiritual and Temporal four times in the year ; And that Foot Ball and Golf be utterly cried down and not used ; And that bow makers make, at ilka parish, a pair of Buts ; And that Shooting be used.'

Though few of us, I fancy, would care to revive the penalty exacted from those 'who came not to the shootings'—two pennies (Scots) 'to be drunken at the Buts'—yet many to-day would most gladly support the clause that football and golf be utterly cried down.

It must not, however, be inferred from such laws as these that the Scots were ever shirkers when it came to defending their homes. Part of the great Flodden Wall, grim monument that it is, stands there to-day in the Vennel to decry so base a charge.

The news of the great defeat and of the death of Scotland's king reached the city before it was known that the English had retired, and great was the consternation and clatter of feet and tongues when the rumour quickly spread that the enemy approached. Then, amid the clanging of the bells which rang from every steeple, a proclamation was read from the base of the City Cross. It exhorted all the women to 'cease their clamour and go to prayer,' while the men were strongly urged to join in completing the wall which would then surround the city and give them the means of defence. Right well did they respond, and in a week the wall was finished, with ramparts, gates, and towers, a marvel of height and strength ; for even the women and children had helped by carrying stones procured from their own poor houses demolished for the purpose. The enemy never came ; but their labour was far from lost, for they raised a lasting monument which for hundreds of years has stood a testament of their devotion to their country and their homes.

But if the citizens rallied well in these far-off days of Flodden, they rallied no less nobly a

hundred years ago. For when the successes of Napoleon made an invasion all too probable, there was hardly a man in Edinburgh that did not carry arms. 'We were all soldiers one way or another,' writes Henry Cockburn in his delightful book of *Memorials*. 'Professors wheeled in the College area, the side-arm and the uniform peeped from behind the gown at the Bar and even on the Bench, and parade and review formed the staple of men's talk.' Indeed, so constant were the drillings, the marchings, and the shootings that from 1803 till 1814 Edinburgh has been described as one monster armed camp.

Not the least enthusiastic of these patriotic citizens—who often, by the bye, drilled as early as 5 A.M.—was the ever-energetic and determined Walter Scott. Debarred by his lameness from joining a regiment of foot, he was soon the heart and head of the Midlothian Troop of Horse ; and many tales are told of his ferocity and skill when sabring a turnip impaled for practice on a stick.

Slowly the years dragged on, and still no enemy came ; but not till the great Napoleon signed his fate at Fontainebleau did Scotland deem it prudent to dismiss her citizen troops.

And now those stirring days have come back to us once more ; once more we drill and march, and wait patiently for news ; and the same unanswered question that rang in our fathers' ears is haunting us, possessing us—the question, 'Will they come ?'

The future alone can answer ; at present no one knows ; but certain things we do know, and these we should not forget. We know that our old gray city has never feared to meet her foes ; that the long gray guns on the Forth are ready and willing to speak ; and that out beyond the suburbs, where the curlews swoop and cry, the khaki-coated sentries are tramping to and fro. And another thing we know—for the last few months have proved it, proved it in Flanders and Scarborough beyond the slightest shade of doubt—we know that never before have our soldiers, citizens, wives, shown such cheerful, practical courage, such indomitable pluck.

THE BRIGHT EYES OF DANGER.

CHAPTER XVI.—IN WHICH I ASK FOR ADVICE, AND TAKE MY OWN WAY.

WE went back to the inn, to the room we had just left. The place was indescribably depressing. The fire was black out. The smell of guttering candles, stale drink, and tobacco hung about, and the cards littered the table and the floor.

Irving rang for fire and more lights, and when these were brought in I told him my story. 'The secret concerns another—others,' I began ;

'and, truth to tell, I am fairly at my wits' end to put a name to it. Irving, man, since I saw you I have been in deadly grips at least twice ; I have seen strange sights ; I have been in danger of being knifed.' I turned up my coat-sleeve and showed him the wound. 'I have been within an ace of being winged, bullets singing round me. Luckily one of them got my horse's ear, and she bolted, or I should not have been

here to tell you the story. All these things happened through my meddling with another person's affairs, and the other person is a woman !' 'A woman ! Your boast on the road up from the Border was that you were heart-free.'

'So I was—so I am !'

'This is a strange business.' He rose, opened the door, and looked into the passage. 'No one there,' he said, and closed the door. 'It behoves us—the town, I'm told, is a fair mowdie-heap for spies and runagates and broken men—to risk nothing if ye have enemies, though how that comes about beats me, for I understood ye had no acquaintances in Edinburgh.'

He looked at me curiously.

'Nor have I, except a decent lawyer that never saw me until to-day, and after the black doings I'll now tell you of I hope you'll be able to see more daylight through them than I can.' And I began to set it all out before him as shortly and clearly as I could. He listened without a word, but his mobile face betrayed his intense interest. With all his hail-fellow-well-met air, under the surface I suspected a deep lode—reserve power, hidden forces. At times I could almost have thought that he was holding his breath in anxiety, and when I came to the final moments of those few crowded hours, he drew a long breath of relief and sympathy, like one who had just escaped dire peril himself. He got up and paced back and forth in deep thought, his eyes very keen, two bright spots glowing on his high cheekbones. I could scarcely have believed that he was so highly strung.

'Ye made my heart loup !' he said. 'Ye cam' brawly out o' the business—brawly ; but what it means neither you nor I can put a name to. I can mak' neither tap, tail, nor middle o' it. Ye are sure o' the name ye said—the lady's, I mean ?'

'Sure—Miss Charlotte Macdonell. She is proud of her name, and gave it with great spirit. Indeed, had you been in my place you would have thought as meanly of yourself as I did ; a great hulk of a man standing like a ninny before a slip of a girl, wondering what would happen next. I am certain that at a nod from her the two Highlandmen would have finished me where I stood. Their hands were itching to get to their dirks.'

'It's plain enough that ye came by accident to a Jacobite house ; plain, too, that the inmates take ye for an enemy, there by design ; and that they think the letter found in your holster had been sent to you.'

'Yes. Up till the escape of the mounted man, when I got the cut on my wrist, I had nothing to complain of. But from the moment that I crossed the door of The Garth I was a prisoner, and, as I think, mighty near taking my last look at this world.'

'And the tall man in the cave, what was he like ?'

'A moving thing it was to see him groping

his way with such stealth and anxiety, so chained in his movements by his blindness ; such a sadness, such impotence in his burning eyes. I once looked upon a cruel thing, an eagle in a cage, and the sight of it poisoned the sunlight. It was in my mind to free it, and I declare that I had the same thought as I watched this man.'

'Ye were maybe safer to lie laich, as ye did. Eagles have talons. Glenira was a word that ye heard, said ye ?'

'What I knew concerning the plot against Glenira ; so said the lady of The Garth.'

'I have a notion that I have heard the name. I think he was afore my time or yours. But the name rings in my mind. Was there no 'a Glenira i' the "Fifteen" ? Tell me again, what was he like ?'

I described the tall man once more, Irving listening intently. He knitted his brows in thought for a little, and then shook his head.

'No ! My mind is as bare on the business as the Moor o' Rannoch o' corn ; but ye have tumbled owre a Jacobite wasps' byke. Do ye want my advice ?'

'I do.'

'Ye'll reject it ; but gin I were you—he looked very earnestly at me—'I would wash my hands o' the whole affair o' The Garth.'

I made no reply.

'Here ye are,' he went on, 'like mysel', wi' little or no mind to meddle wi' politics, young, come into your ain bit rent-roll, a smooth enough road in front o' ye through life, and what has happened ? The very first week that ye venture from your father's roof ye are like to get your feet taigled wi' Lord kens what—Hieland dirks and ladies in tempers and tears by turns, a blind man that kens secret passages and hides papers when decent folk are asleep, and—— By the way, ye didna show me the paper.'

'I left it with the Writer to the Signet, for safety. I sup with him to-night, and shall ask him for it.'

'I might have a look at it when ye get it back. On the back o' all this comes your man in the brackens wi' a pistol keeking out o' his pouch, and then you on a barebacked horse, bullets singing about your lugs ! Ye have had a fair runaway tirl at death's door.'

He smote the table with his fist until the glasses rang.

'The whole business scunnors me, Mr Layton. Tak' my advice, and see no more o' Miss Bright Eyes, or ye'll maybe never see your bonny Westmorland fells again. Ye'll pardon my speakin' frank and free ; but we made good company on the North Road together, and it would never be the part o' a friend (so to call myself, Mr Layton) if I didna open my mind to ye. Ye have your choice between peace, hame, the bonny place o' Darehope, and a fine

dounsettin' to your name; on the other hand—Faugh!' he snapped his fingers—'a meddlin' and trokin' wi' the affairs o' strangers, schemin' Jacobites or worse, the chance o' a slit throat, or, at the best, the chance o' your name being in the Lord Advocate's List wi' a black mark forment it.'

'But this affair need not entangle me in politics,' I interrupted.

'No, if you keep outside it. But rebellion is rebellion, and the next sax months may see a wheen necks in a tow. You and I cannot put a name to this business. Cast it behind ye. Take my counsel, Mr Layton! Ye're followin' a marsh lamp. Leave The Garth folk to redd out their crooked affairs wi' their ain hands. Again I ask ye, take my counsel. Get your affairs settled with the lawyer, and put your horse to the road again for Westmorland.'

He had laid a hand on my shoulder, and spoke so earnestly that I was loath to say anything that might savour of my taking offence. Yet I could not bring myself to the idea of leaving Edinburgh so soon. These were stirring times. Cope's army was at the very moment in the East Lothian. There would be a coming to grips between Stuart and Hanover. Fighting was in my mood. I was fain to see war. I pictured myself back, the centre of interest, at Westmorland, telling all that my eyes had seen—no longer a stripling, but a travelled man full of experiences at first hand; a person of some consequence. I suppose my thoughts cast some reflections on my face.

Walter Irving looked at me narrowly. 'I see ye are switherin',' said he.

'I am. I am thinking that I cannot come by much harm if I tarry a day or two in Edinburgh. The clash of steel is worth listening to. It calls me, and—and'—

'And ye have a score to set right wi' Mistress Charlotte Macdonell, her wi' the come-hither in her eye!'

I rose to my feet in a clap of anger, the blood in my face. 'You take a liberty. It would be well to leave her name out of this talk altogether.'

He raised his eyebrows, saying nothing for a long minute; and when he spoke his words stung me, although they were simple.

'So!' he said at last softly, as if to himself. 'So that's the way o' it! That's the way o' it!' I disdained to reply. 'Your mind is set, then, on meddlin' wi' other folks' affairs? So be it. Never say I did not warn ye. So be it!' He had gone to the door, and was standing holding it open. 'I—I meant well,' he said awkwardly.

I was too irritated to reply. Next moment he had closed the door behind him, and I heard his footsteps going down the stair.

I instantly began to repent of my flash of temper. It was true that he had presumed on

his acquaintance with me, but it was the first occasion of it. His reference to the lady of The Garth grated on me. Still, he was not of my station, I reflected. His outlook would probably be different from mine, and I might have been somewhat to blame in making free with him on our ride north. His advice to hasten back to Westmorland chimed with prudence. As he had said, he had meant well. A wavelet of regret touched me. I could almost have run after him to offer him my hand; but the moment passed, and I paced up and down the room, disquieted.

The voice of experience fretted me with its empty yet impregnable logic. Copy-book maxims of my schooldays—'Count the cost,' 'To-morrow oft means never,' and their kindred—passed in colourless procession. Their dull precision galled me. There was no quick blood in these sluggish burgesses in life's business. They were secure, too secure, in their citadel of prudence. Outside it, were there not heart-beats, colour, danger's bright eyes? Nevertheless, I reflected with a sigh, to listen to and obey these measured voices of experience was the ordinary lot of mankind. So I sat there in a little fever of unhappiness, my head in my hands, fully conscious that I was engaged in the most sterile of all mental phases—trying to convince myself against my will. One moment my thoughts would be on the smooth tide counselled by Walter Irving; the next there would come a swirl in the current, to cast them about and buffet them in conflicting waves of emotion, until they were spent and useless. I railed at myself for a weak trifle with Fate.

I might have sat balancing my thoughts until dawn; but I remembered my invitation to sup with Mr Peter Scott. The time was now after eight o'clock, and when I made a change in my dress and went out, the dusk had thickened. As I turned sharply at a corner to avoid a knot of people, my mind was still hesitating at the cross-roads of my life. But watching Destiny had played with me long enough, and there and then, in the twinkling of an eye, shook me to a resolve with a strong and contemptuous hand. There was a sound of hoof-beats, a flare of tossing torches, and in their momentary but trenchant gleam I saw a woman, wearing a screen of Macdonald tartan, riding a chestnut horse. The dusky street suddenly lit up.

She looked neither to left nor right (trouble in her eyes, I thought), and did not see me in the press of people. But an instant and she had passed, and the place was strangely dark again. It was as though a door in a lighted chamber had been suddenly clanged in my face. I stood and watched the torches of her running servitors dwindle from ruddy jewels to pin-points and vanish; and, strangely happy (although my heart beat unevenly, and the street seemed a leaguer of gathering shadows), I turned swiftly

where I stood, and went back to the 'White Horse' to tell the landlord that I had changed my plans, and that my mind was to remain where I was.

Prudence and cold reason fled at the first

quickened beat of my heart. The armoury of logic that almost had sent me soberly home to Westmorland fell like a house of cards before the first breath of the wind of my desire.

(Continued on page 244.)

LITTLE LUXEMBURG.

By ROBERT MACHRAY.

OF few parts of the world can a more varied, interesting, and even exciting story be told than of Luxemburg, whether by the name is meant the Grand Duchy or the city which is its capital; nor is there a much prettier or more attractive small country under the sun. Yet the whole land, of which I am to write under the affectionate and at the same time quite accurate title of Little Luxemburg, is known to very few people outside it and the districts immediately adjoining. Many travellers, on their way across it, rushing perhaps from Brussels to Bâle, have caught fascinating but fleeting glimpses of its beauties, and could scarcely have helped thinking that they would like to pay it a visit some day, if haply the opportunity came. Being about a dozen hours' journey or so from London, it was accessible enough in ordinary times, and doubtless will be so again when ordinary times recur; but the fact remains that, speaking generally, it was and is *terra incognita* to the vast majority; the man in the street knoweth it not, its soil has never been desecrated by the common roaring and ramping tourist, and some of us gave thanks for 'that same.' Still, twice within the last fifty years Luxemburg has suddenly emerged from its not altogether unhappy obscurity, and become, at least for a brief space, the topic of well-nigh every tongue.

The former occasion shortly preceded the Franco-Prussian war. Napoleon the Third wanted Luxemburg for France as a set-off against Prussia's gains after her defeat of Austria in 1866, and this precipitated a crisis which nearly produced a rupture between these two Powers, incidentally bringing the Grand Duchy into universal notice; then the matter was settled amicably, or at least without bloodshed. The latter occasion is of far more sinister significance. On 1st August 1914 Germany took the initial serious offensive move in the western area of the great war by seizing Luxemburg. The 1st of August of that year, destined to be ever memorable, was a Saturday, and during the night hours of that date the Germans secretly threw forward, according to plans long matured, a strong advance guard, which, by occupying the stations and the bridges on the Trèves and Trois Vièrges Railway lines, was able to take Luxemburg completely by surprise, as well as to ensure a free passage to the German armies through the Grand Duchy by rail to both the French

and the Belgian frontiers. In its unexpectedness and the rapidity with which it was executed the *coup* was so absolutely successful that when the Luxembourgeois woke up on the Sunday morning, it was to find, to their profound astonishment and dismay, that they had lost their country without the striking of a blow! Their distress could not have been lessened when they recognised in officers of the invading forces men who, up till two or three days previously, had been living in their midst in various capacities and accepted as friends and neighbours. Germany's seizure of Luxemburg, in this swift and dramatic manner, opened her campaign in the western theatre of operations, and focussed the eyes of the world once again on the little Grand Duchy.

This seizure of Luxemburg was an act of the basest treachery on the part of Germany. What was known as the 'Luxemburg Question'—a phrase which epitomised the former occasion that brought the country forward so prominently—was solved by the diplomats by the Treaty of London in 1867. By that treaty the independence and neutrality of the Grand Duchy were guaranteed by the Powers of Europe, Prussia of course being one of them. As in the far graver case of Belgium—far graver, because the interests involved were of much more importance, though the principle violated was precisely the same—Germany, in these days another name for Prussia, did not scruple to tear up this 'scrap of paper' when she thought it to her advantage. Luxemburg was in no position to offer the slightest resistance. By a sorry trick of fate the very treaty by virtue of which she existed as a sovereign autonomous state had deprived her of any power she might have possessed to make a stand against foreign aggression; for by its provisions the fortifications, which had made the city of Luxemburg, itself a great natural stronghold, one of the most formidable places on the earth, were demolished. The special irony of the thing was that the rocky plateau on which the city stands is connected with the surrounding country only on the side next to France, its other sides being defended by deep, precipitous gorges; thus nature had seemed to place a tremendous barrier in the way of an advance from Germany. Whether—seeing the overwhelming effect of high explosives and enormous guns on Liège, Namur, and other

fortresses—the city, had it remained fortified as it was prior to the treaty, could have long prevailed against German assault may be questioned. But whatever chance it had was gone. Beautiful public gardens and fine residences had taken the place of its forts, and in military terms it was an open town, incapable of defence and defenceless. The Germans simply walked into it.

On the night of 1st August German troops seized the Adolf Bridge, Luxemburg's chief viaduct, and a great triumph of engineering due to the genius of Monsieur Ségourné, the famous builder of the Paris-Lyon-Méditerranée Railway. All they had to do was to march into the city. The army, if such it can be called, of the Grand Duchy consisted of some three hundred men and half-a-dozen officers—really at best a police force; but the majority were postmen, railway hands, and custom-house officials, who were soldiers only occasionally. Resistance on the part of such troops, even if they had been concentrated on the spot, would have been as absurd as it would have been futile; they could do nothing against the German hosts, and they did nothing. The first detachment of the German force arrived early on the morning of 2nd August at Sept Fontaines. M. Eyschen, the Minister of State of the Grand Duchy, drove in his motor-car across the Adolf Bridge, and presented to the officer in command of the German advance guard a copy of the treaty which Prussia had signed along with the other European Powers guaranteeing the neutrality of the country. Vain, silly scrap of paper! The German officer replied that he knew of its existence; it did not concern him in the least; he 'had his orders.' The Grand Duchess, the sovereign of Luxemburg, a young, pretty, and high-spirited princess of twenty, who had succeeded to the throne two years before, entered an emphatic protest by trying to block the bridge with her motor-car, but she was sternly told to go back to her palace and keep quiet. General Vandyck, the Commandant of Luxemburg, who had followed her on to the bridge, had a revolver levelled at his head. It was a case of *force majeure* of an overwhelming kind, and the Grand Duchy had to resign itself to the inevitable. A prominent American critic has contrasted the action of Luxemburg with that of Belgium to the former's disadvantage; but there is no real parallel between the two, as a moment's consideration of their respective circumstances shows. No British writer is likely to minimise in any degree the magnificent stand made by the Belgians, and I certainly as little as any. But neither the Grand Duchess nor her people had the ghost of a chance. Unwillingly enough, they bowed their heads.

Nothing could have been more unpalatable, more hateful, to the Luxemburgers than the occupation of their beloved and lovely little land by the Germans, in spite of the facts that

its sovereign, of the House of Orange-Nassau-Vianden, has German blood in her veins, that the majority of its population is of Teutonic origin, that its 'vulgar tongue' is a kind of German, and that it has long been a member of the German Zollverein. 'There is no one,' it has been truly said, 'that a Luxemburger hates so much as a Prussian.' The inhabitants of the Grand Duchy have for many years past strenuously resisted the Germanisation of their country.

There is not room in a short article such as this even to outline the ancient history of Luxemburg, which has memories of Cæsar and his legions, Attila and his Huns, Charlemagne, and other great figures. The present Grand Duchy is the eastern half of the old Duchy of Luxemburg which shared the vicissitudes of the Netherlands after its union with Burgundy in 1443. After the fall of the great Napoleon the Congress of Vienna carved out a new Europe, and Belgium and Holland became one kingdom under William the First. Nassau was taken from him, but he was given the Grand Duchy of Luxemburg in its stead. In 1839 what is now known as Belgian Luxemburg was divided off from the Grand Duchy, leaving the latter with an area of barely a thousand square miles; it is smaller than many an English county. The kings of Holland continued to be Grand Dukes of Luxemburg till the death of William the Third in 1890. When Queen Wilhelmina succeeded him on the Dutch throne the Salic Law deprived her of Luxemburg, which passed to her relative, Adolf, Duke of Nassau, a principality which had been annexed by Prussia in 1866, but under an arrangement which left him an immensely rich man. Adolf died in 1905, and was followed by his son Wilhelm, who passed away in 1912, leaving seven daughters, the eldest of whom, the Princess Marie Adelheid (Adelaide), became Grand Duchess, under a law made by the Parliament of the Grand Duchy itself some years before, when it appeared certain that the Grand Duke Wilhelm would not have a son to succeed him. From 1815 to 1866 the Grand Duchy, though its sovereigns were Dutch, belonged to the Germanic Confederation, and the fortress-city of Luxemburg was garrisoned partly by Dutch and partly by Prussian soldiers. It was after the dissolution of the Germanic Confederation that the Treaty of London, 1867, declared the country neutral territory, and guaranteed its integrity and independence.

Even from the above very brief sketch of the modern history of Luxemburg it may be gathered how strong an influence Germany might have on the Grand Duchy. Previous to the reign of the Grand Duchess Marie Adelheid, German influence was well-nigh supreme at Court, though deeply resented by the great bulk of the population, who are a sturdy, independent sort of folk, about a quarter of a million in number, mostly agricul-

turists and miners, conscious of the privileges they enjoy in a free, constitutional, self-governing state, and determinedly opposed to the absorption of their country in any other. The railway system was under German administration; Germans were put into official positions instead of natives; and at times almost desperate attempts were made to replace French, which is the official language of Luxemburg, by German, but these efforts were unsuccessful. It may be remarked in passing that the Grand Duchy is bilingual, as under the Constitution of 1848 both French and German are recognised; but French is the parliamentary, administrative, and judicial language. Both languages are taught in its primary schools, but French prevails in the higher schools. The 'vulgar tongue,' to which I referred before, is a *patois* peculiar to Luxemburg, and, though mainly derived from the German, includes Keltic, Roman, Saxon, French, and other words all drawn from the speech of the different peoples who at various periods possessed the land; through the Saxon, it is interesting to us to note, it has words and expressions as English, even in sound, as any we use to-day.

Soon after the Grand Duchess Marie Adelheid ascended the throne she gave evidence of considerable strength of character, girl though she was, and particularly in identifying herself with the general anti-German sentiments of her people. Reversing the policy of her predecessors, she substituted native for German officials, and otherwise encouraged the local spirit of independence, so that she was adored by the Luxemburgers.

Germany, knowing well that she was doing a great wrong, as indeed she subsequently acknowledged officially in her Parliament, though she attempted to justify it on the ground of necessity, tried at the outset of her occupation of Luxemburg to give it as decent an appearance as she could. On the 2nd of August the Imperial Chancellor at Berlin telegraphed to the Luxemburg Government that no hostile act was intended, but only such measures were to be taken as were necessary to secure the safety of German troops by protecting the railways of the Grand Duchy from probable attack by the French. In other words, Germany said that she was not at war with Luxemburg; but she took care at once to act as if she were, although compensation was promised, by destroying houses, cutting down woods and crops, and by demolishing anything that might afford cover to an enemy. With the German troops in effective possession of the country and its capital, it can readily be supposed that the pro-German party in Luxemburg jumped at the opportunity to pay off old scores; certain persons were arrested, and others, it has been stated, were executed as spies; the rumour spread that the young Grand Duchess, certain to exhibit her customary courage, had been conveyed across the frontier and imprisoned in a German fortress. All that happened during the

first months of the war with regard to Luxemburg has still to be elucidated; but it appears to be the case that, speaking generally, the Germans maintained as 'correct' an attitude as was probably possible in the circumstances, as may be guessed from the facts that they did pay part of the compensation promised, engaging that the balance would be made good in due course, and that the Grand Duchess was permitted to open in person the Parliament of Luxemburg in mid-November by a speech from the throne in which she recorded and reaffirmed the protest of the Grand Duchy against its seizure and occupation.

The result has been—at the time this is written, at all events—that Little Luxemburg has been spared in a very large measure the awful horrors and the frightful devastation and desolation that have been the sad and terrible portion of Belgium. Whether the Grand Duchy will altogether escape some of the worst effects of war before the end of the great struggle is reached remains to be seen; but I, for one, hope that destiny will be kind. It is a beautiful country, though of course it is not equally beautiful everywhere. The north is the south-eastern part of the lovely region of the Ardennes, Caesar's *Arduenna*; but neither the French nor the still more attractive Belgian Ardennes, favoured by many British visitors, can show such an entrancing panorama of hill and vale, stream and forest, old storied castles and quaint villages and homesteads. The centre of the Ardennes of Luxemburg is Diekirch; and when the war broke out there was gathered there its usual gay holiday population, Dutch, Belgians, French, a few English and other outlanders, on whom, as on their unsuspecting hosts, the occupation of the Grand Duchy must have come as a veritable bolt from the blue. It was the same at other main points of interest. My friend Mr Francis Gribble, the well-known author, was at Vianden, which, with its mediæval village on the Our, fronting the Prussian Eifel, and its magnificent partly ruined castle, one of the birthplaces of the royal families of Holland and Luxemburg, is the most picturesque 'bit' in the Grand Duchy, and one of the most romantically beautiful spots in the whole round world; there Victor Hugo pleasantly spent one of his periods of exile during the Second Empire, as he has told us. Mr Gribble tried to effect his escape by way of Coblenz, but was seized and imprisoned by the Germans. By-and-by, however, he will have a story to put on paper which, I fancy, will perhaps recompense him for some of the suffering he endured.

From Diekirch, after enjoying the numerous charming promenades and excursions in its immediate neighbourhood, one went through the fascinating district to the south of it known as *La Petite Suisse Luxembourgeoise*, with its miniature Alps, rivers, and glens, a fairyland, to Echternach, an old-world town still a-dream of

the Middle Ages, of which its famous annual Pentecostal 'Dancing Procession,' dating back to the thirteenth century, is a strange and unique survival. From ancient Echternach the traveller journeys to the city of Luxemburg by the Prince Henry Railroad, along the valley of the Sure, and there he comes face to face with history graven in rock and stone for twenty centuries; and such a history, so varied, so striking! The country west of the city and all the south of the Grand Duchy is mainly agricultural land, with

considerable mining in the canton of Esch, as its many furnaces, forges, and foundries indicate. This part of Luxemburg is called Gutland, and from its fertility deserves its name; the other part, with Diekirch as its chief place, is called Osling; each has a beauty and a charm of its own, and over both, in ordinary times, there breathes a spirit of peace and happiness that is a perpetual joy. For my own part, I love this simple, lovely little land, and wish it well out of these desperate days.

THE STRANGLERS OF POLP.

CHAPTER II.

'THERE!' he continued. 'Now we can both breathe again without thought of trouble. But you must let me keep this ugly little object in remembrance, and to help me to what they call in England "too the line" prudently in the Blenaria which it is my hope soon to love as fondly as you, of course, love her yourself. I do not go there for fun, you know, but to try to give the people good times, because I have been asked to do so. That is what good government means—good times, happy homes, as they say in prosperous England, where there are so many of them, with something nice in the pot every day that they can eat without a fear that it will be taken away from them. Well, you are feeling better after this little sermon—eh?'

The strangler made no reply. From the time when his arms were released he sat like a stone image, staring straight before him. The deepening colour in his cheeks alone told the Duke that his little sermon had not fallen on deaf ears.

'Come, you need not be sad!' continued the Duke blithely. 'I must give you a *petit verre* of old cognac to buck you up, I think; but, before I let you go, just tell me something. How do your friends think my death would be a benefit to Blenaria? Another thing I do not understand at all is how you come to me from my tailors, Ponting & Proud. Never mind about that, though; there is no time to—Hello!'

The strangler had sprung to his feet with an ejaculation, and for a tense instant or two his eyes and the Duke's met and engaged at close quarters. Then he bent his knees to the Duke, touching the floor with the right one.

'Don't do that, my boy!' whispered the Duke, much moved by what he had seen in the young man's eyes. 'And you shall not do that either!' he cried.

The strangler had fumbled a little bottle from his waistcoat-pocket, and was pulling at the cork.

But the Duke was too sharp for him, and easily took it from him. 'That was very wrong

of you,' he said. 'What for do you want to do a silly-ass thing like that—eh?'

'It is what they expect of me, and I might as well be dead as not,' answered the strangler, looking straight at the Duke.

'So! They expect it of you? The gentlemen in Whitemonk Street?' asked the Duke, no longer smiling.

'My father expects it, sir.'

'Your father expects it? Oh, but I can't believe that. He is not altogether a barbarian, your father. And, in any case, you must disappoint them,' said the Duke, with his hand on the boy's.

A loud knock at the door, after an attempt upon the handle, made him turn and cry frowningly, 'Yes, yes! Who is there?'

The anxious voice of Von Enselsing replied, 'It is I, sire.'

'Ah!' The Duke raised an admonitory finger to the strangler as he went to the door. 'I am not yet ready for you. Give me another minute or two, my Albrecht,' he called out. 'Perhaps I do not go to the Ambassador at all. Telephone and say so. I have matters of more importance, but you are not obliged to tell him that. There! that will do. Run away. It is my wish.'

He rejoined the young man, and said, playfully at first, 'It is really a great bore to be a king, and perhaps your friends are more kind to me than they believe in trying to keep the crown from my head. But it must be good-bye now. Your name is Kragatz, then, since you are a son of the famous chieftain?'

'Yes, sir, Pedro Kragatz,' answered the strangler without hesitation.

'And you go now to your friends'—

'They are not my friends now, sir. I have done with them. But I am going there to tell them so,' interrupted the strangler, with a light in his eyes that dignified him more than a little.

'Ah!' said the Duke, noticing the change in him. 'You go to this house in Whitemonk Street? Naturally they did not give me the

number of the house in their letter to me, or perhaps'—

'It is No. 19, over a French laundry, on the third floor, and you may send the police to arrest them, for all I care, although my own father is one of them. It makes me sick,' said the young man huskily, in a breath.

'No. 19—and it makes you sick! I'm glad it makes you sick—very glad!' said the Duke slowly. 'Perhaps I shall see you in Blenaria yourself soon?' He offered the strangler his hand.

But instead of accepting this tribute of more than forgiveness the young man snatched up his hat. 'Let me out, sir,' he cried as he made toward the door. 'I want to get into a church and say some prayers.' With his hand on the key of the door, he faced round, and a tormented sort of smile flickered in his eyes as he whispered, 'Since there is only you to hear me, I shall say, "God bless Ulric, King of Blenaria!" and chance it, sir.'

The Duke made no movement to detain him from opening the door. 'Adieu, my boy! and just the same blessing to you,' he whispered back.

He was sitting in an absorbed attitude in the chair vacated by the strangler, when a rush of footsteps in the corridor prepared him for something else; and, after a quick movement in the lock of the door, Von Enseling, Hans the valet, a round-faced, dapper little gentleman whom the Duke recognised as Mr Proud the tailor, and an official of the hotel whom he did not know, with a key in his hand, all entered the room excitedly, the aide-de-camp leading.

'Your Majesty is—safe, then?' almost shouted Von Enseling joyously.

The Duke looked from one to another of them with raised eyebrows. 'Safe? To be sure I am safe. What is all this fuss about?' he asked. 'Ah!' he then exclaimed, 'this is my worthy friend, Mr Proud. So you have recovered your health, Mr Proud? I must compliment you about that. But this gentleman with the key—what has he to do with me?'

The Ritz official, thus addressed, took the hint of dismissal in the Duke's tone and manner. He bowed himself out of the room, with a murmur of contentment that there was obviously no cause for alarm about His Majesty.

'You may close the door after you, please,' said the Duke; and the Ritz official did that also.

But already little Mr Proud, the tailor, had begun the story of his grievance. 'I have been the victim of a most diabolical outrage, your Highness,' he burst forth. He pointed at the measuring-tape and his business record book which the strangler had brought with him, and used them as an inspiring text for his narrative.

'The infamous scoundrel who has presumed to impose himself upon your Highness as one of our assistants, for some nefarious purpose which fortunately'—

With his chin in his hand, the Duke listened to the outpouring, but showed little interest in it.

Punctually at a quarter to six Mr Proud had mounted into a taxicab to keep his appointment with the Duke. About one minute later he was overpowered in the car by two strangers who had joined him during a temporary obstruction in the street with a polite audacity which spell-bound him at the time, and which he now lacked words to describe. They had forced him into the well of the car, gagged him, tied his head in a sack, his hands behind his back, and his feet at the ankles, and kept him thus nearly suffocated while the car drove he could not tell whither for hours—so it had seemed to him. At length the car stopped, and he was lifted out, still with his head in the sack, and left to lean against a wall. And there he might still have been leaning (awaiting death, he said) but for the providential aid of a school-teacher who chanced that evening to take a short cut to her lodgings past the back of the particular house, in the neighbourhood of Hampstead Heath, against the garden wall of which the miscreants had propped him.

'But I scarcely even thanked her, your Highness,' said little Mr Proud, with much elation at this stage, 'for I had in the meantime put two and two together in my mind, in spite of my physical distress. The scoundrels had not, so far as I was aware, robbed me, and I understood, therefore, that they were after higher game than me; or, rather, I should say—since the expression is open to misconception'—

'In other words, they were after me, not you—eh, Mr Proud?' interjected the Duke, as if nothing could be more natural. 'That was very smart of you, and like a detective, my dear Mr Proud.'

'Yes, your Highness; it was a plot from the very outset. I felt convinced of it. The driver of the taxi and the other two ruffians—well dressed both of them—were in a wicked confederacy to'—

But the Duke had now had enough of it. 'I think that will do,' he said, rising and offering the tailor his hand, which had in the meantime been idly toying with the garrotte still round his left wrist. 'I thank you, my dear Mr Proud. It is all *very* like a story in a newspaper, but I don't want to hear about any more of it to-day. And these wardrobe matters—these mere trappings of state, eh?—must wait also. You come to me to-morrow morning, about ten, let's say. Perhaps I tell you then about that young chap who took your place, perhaps not. He measured me twice up the arms, and'—the Duke's smile when he hesitated held the three men entranced—'and that's all for the present. Good-bye,

my dear Mr Proud. I've had a very occupied day.—Fact is, Albrecht, I think I'll lie down for a little. There is something I wish to consider about, by myself. You see Mr Proud safe to the street yourself.—Until to-morrow, then, Mr Proud, ta-ta !'

Nothing could have been more congenial to the tailor than to be addressed, even sent away, with such flattering friendliness by a Duke who had become a king. And his gratifications of

that sort were heightened by the tone of asperity with which, immediately afterwards, the Duke, having taken up his coat on his way to the bedroom, ordered Hans the valet to stay where he was.

'I do not want you—or anybody—until I say so, mind that !' the Duke added, with a nod for the aide-de-camp which told him unmistakably that he was included in the phrase.

(Continued on page 249.)

THE ROMANCE OF AN AMERICAN EDITOR AND PUBLISHER.

THE life-stories of the men who have engaged in the merchandise of literature are quite as interesting, instructive, and fascinating—perhaps more so—as those of persons who have been engaged in the merchandise or manufacture of soap, cotton, iron, or steel, although the monetary rewards may amount to very much less. The stories of the British pioneers in book-selling and publishing occupy a distinguished place in the realm of biography. Although we know much less about them in this country, the United States has also furnished many men of outstanding ability in these professions. Up till recently author and publisher here had a distinct grievance: it was possible to reprint in America valuable works without compensation to the men who had written and produced them. There were honourable exceptions; but the literature so produced was called 'pirated literature,' and for many a year the American public had quite an easy conscience about the matter. The same American public has been quick to recognise genius and merit in British writers even before some of them were acknowledged in Great Britain. Long before Thomas Carlyle had received any money from the British edition of his *French Revolution*, three instalments of fifty pounds each were sent him from an American publisher, mainly through the exertions of his friend Emerson. The British edition of Thomas De Quincey's works was based on a collection of his miscellaneous writings first made in America. It is on record that Mr J. T. Fields, the American publisher, left a cheque with De Quincey when calling upon him at Polton. Dickens and Thackeray, though they could only get payments for advance sheets of their works, managed to gain enormous sums by reading and lecturing in the United States. They thus benefited, in a way, by the previous universal circulation of their works there.

Some American firms have a world-wide reputation. James and John Harper, who founded the firm of Harper Brothers, were at first expert printers, who began printing books on their own account in 1818. They were keen, sagacious, and honest business men, and the firm

that they founded introduced a great many of the new works of English authors in their various 'Libraries.' Besides, they became successful publishers of periodicals. James T. Fields, of the Boston firm of Ticknor & Fields, was a personal friend of the authors for whom he published, the most distinguished of these being Longfellow, Hawthorne, Emerson, Holmes, Whittier, and Lowell; while he introduced the works of De Quincey, Tennyson, and the Brownings to American readers. For a time he edited the most literary of transatlantic periodicals, *The Atlantic Monthly*. George Palmer Putnam, founder of Messrs Putnam's Sons, and his son George Haven Putnam, have been honourably associated with the Copyright League, which furthered the Copyright Bill of 1891. The younger Putnam has published, among other works, a narrative of his experiences as a prisoner of war in Virginia.

An editor and publisher of genius and originality, Mr Samuel Sidney McClure, has published *My Autobiography* (John Murray and F. A. Stokes Company), which is a distinct and valuable addition to this class of literature. It tells how this remarkable Ulster boy founded a newspaper story syndicate of a novel kind, and also became the founder and editor of a magazine. Another Ulster boy, Alexander Irvine, has written a remarkable autobiography, entitled *From the Bottom Upwards*, and its sequel, *My Lady of the Chimney Corner*. Both men displayed remarkable courage, grit, and perseverance. Samuel McClure (for the middle name is a later addition) had in turn been farm-boy who ploughed, milked cows, did odd jobs, washed; acted as schoolmaster, as printer's devil; been a butcher, cook, and peddler—all to get the wherewithal to pay for his classes during the period of his curriculum at Knox College. Sometimes half-starved, he lived on eighteen cents a week, his cheerful philosophy through all being, 'If you don't mind a thing it can never hurt you.' Success was only reached after twenty-five years of uninterrupted bodily and mental exertion and constant financial difficulty. Robert Louis Stevenson took McClure as the

prototype of Jim Pinkerton in *The Wrecker*. Through his syndicate and magazine he was the means of introducing work by R. L. Stevenson, Meredith, Conan Doyle, and Rudyard Kipling to a large American public hitherto ignorant of it. He bought from their authors and printed such stories as interested himself, and believed that the bulk of his Middle West readers were interested too. His test of a story was how it interested himself personally, and at intervals he would further test it by reading it again, maybe three times over. He introduced a new kind of article into his magazine which anticipated the newspapers, and from the method employed of working them up several of these 'specials' cost from four hundred to eight hundred pounds each. The first account of Marconi's wireless was given in *McClure's Magazine*, and was heartily disbelieved by many readers. He 'got a renewal of the power to be interested' by breaking away for a time from the work in hand, as from restlessness he had been doing all his life. 'Good editorial work,' he says, 'can only be done out of spontaneous personal interest, and it cannot be forced. To lose his enthusiasm is the worst thing that can happen to an editor, next to being without any.' Mr McClure's test of the market value of a writer was that of every publisher—the number of people who would read what he had written; and he held that 'the only critic worth listening to is the publisher, the critic who backs his judgment with his money. A writer does not exist until he is read.' His own ideals were not to get rich quickly, but to get an education, the wife of his heart for whom he worked and waited, the founding of his newspaper story syndicate and a popular magazine.

Samuel Sidney McClure was born on a small farm midway between Londonderry and Belfast, in County Antrim, on 17th February 1857. His mother, Elizabeth Gaston, the daughter of a farmer, was a woman of unusual vigour, intelligence, and great energy, who often did a man's work in the fields besides that of a woman within doors. She was of Huguenot descent; his father's family belonged originally to Galloway, in Scotland. Thomas McClure, being a joiner, made all his own house furniture. The parents, though poor, were of the well-to-do poor, decent, church-going folks, who aimed at giving their children a good education and a right start in the world. The children attended the National School, and Samuel McClure liked going and coming from it, and the lessons he learned there. 'My life, the pleasant part of it, has always been made up of interests, and my school was my first live interest.' There he was perpetually hungry, owing to his thriftless habit of eating his lunch on the way to school. He could never get enough books to read; amongst the few he had were the *Pilgrim's Progress* and the Bible, the stories in which took the place with him

of books of adventure. His father died by an accident when the boy was eight years of age; their small farm was sold for one hundred pounds, and Mrs McClure and her boys emigrated to the United States, settling near relatives at Valparaiso, Indiana. It would serve no useful purpose to mention all the various occupations adopted by mother and sons in order to earn an honest livelihood; these have been already indicated in the case of McClure. The optimistic Irish boy, when it was decided that he should have more education, started for Knox College, Galesburg, Illinois, with eight dollars in his pocket, which was reduced to fifteen cents when he got there, with a seven years' curriculum before him. For the first month he lived on grapes, bread, and soda crackers. He had never any difficulty in getting work to do; and the way in which he did it, and its variety, is charmingly told in the autobiography. How he could study after being a boy-of-all-work in the morning and evening is not explained; but he did succumb to cold and semi-starvation more than once. During the period of work and study he hardly ever read a newspaper. And when he fell in love with a brilliant and beautiful girl, Miss Hurd, the Latin professor's daughter, he received the cold shoulder from her parents at first. He was for a time estranged from her also. School-mastering in the vacation did not agree with him; peddling various kinds of wares up and down the Middle West did, however, and gave him money for winter work. Some of the articles he sold were coffee-pots, microscopes, lamp-wicks, pens, cheap hosiery, and handkerchiefs. Travelling about three thousand miles round the Great Lakes not only established his health, but gave him a knowledge of the kind of people he had to cater for when he had literary wares to sell. In 1876 he returned to Ireland with his mother, who wished him to settle there; but he worked his passage back as cook's assistant to the officers' mess, reaching Galesburg with one dollar in his pocket.

After graduating with distinction at Knox College in 1882, McClure felt disappointed with himself in that he was no taller, no wiser, and was without plans for the future. Miss Hurd had ceased to correspond with him. Disappointed and careless of what came to him, he arrived at Boston with six dollars in his pocket, anxious and willing to do anything. His first employment was that of helping beginners to ride at a cycle rink. Colonel Pope, who was at the head of the great manufacturing establishment which employed him, saw the good qualities, the earnestness, grit, and talent of the youth, and gave him his first chance, which was to edit the *Wheelman*, a cycling magazine. Cycling was then in its first enthusiasm, and one of McClure's earliest enterprises was to purchase from the *Century Magazine* the electro-plates of an article, 'A wheel Around the Hub,' in that

magazine, and the right to reproduce it. The style of the page of the *Century* was copied as well. It began to be evident that he had at last got into his groove, and was now earning fifteen dollars a week. What pleased him even more, he saw Miss Hurd again, and after seven years' acquaintanceship he was married in 1883 to this unusually gifted and accomplished woman. Through Mr Roswell Smith, of the *Century*, he secured an engagement at the De Vinne Press, with twenty-five dollars a week, his work consisting in reading proofs and in making up the work done by the compositors. His wife also secured a position on the staff of the *Century Dictionary* at fifteen dollars a week. Her work consisted in selecting sentences illustrating the usages of certain words for quotation in the dictionary. The work-hours were from seven to six, with half-an-hour for lunch. Then both husband and wife went home dead-tired, cooked the dinner, and washed the dishes. Sunday was the only day they saw each other by daylight.

Then his power of invention and initiative awoke again, and he inaugurated in 1884 his newspaper syndicate for selling to various newspapers and magazines old stories and new stories which he bought from authors. He found the selling of the stories commissioned from authors the difficult end of the business. His method was to buy a story from the author at a certain price and sell it to perhaps a hundred newspapers. At the end of the first week he had made a loss of ten pounds.

Mrs McClure had to be very economical; she cooked on a one-burner stove, while the husband did the washing to save his wife. All the time during many ups and downs McClure says he was very happy: 'I was rich in ideas and in hope, and my wife believed in my ideas and in me.' Mrs McClure attended to business when her husband was travelling, wrote business letters, prepared copy, and made translations of French and German stories for sale by the syndicate. McClure began to secure work by the best American and British authors, and took in Mr J. S. Phillips as business partner. He sometimes spent seventeen successive nights in sleeping-cars, but never had so many editorial ideas as when hurrying about from city to city talking with editors and newspaper men. The restlessness which might have been a weakness was used to serve the ends of the business. 'Whatever work I have done has been incidental to this foremost necessity to keep moving.' As soon as his syndicate began to pay there were competitors in the field, and this sent him to England in 1887 to see authors personally. He had read R. L. Stevenson's *Kidnapped*, and was delighted with it. He communicated with Stevenson, and had an interview with him later in New York. The author received him in bed. McClure says: 'The thing about his appearance that most struck me was the unusual width of

his brow, and the fact that his eyes were far apart.' Later he was enabled to offer him a commission at the rate of two thousand pounds a year for a short essay every week to be published in a New York newspaper. 'He had already such a news value as to be worth that to a paper.' Mr McClure gives the wrong name several times to the weekly journal in London which printed Stevenson's early stories. One of them, the *Black Arrow* under another title, brought in more money to the syndicate than any other serial, though his wife could never read it. For two more stories McClure offered Stevenson sixteen hundred pounds each. He blushed and looked confused, and said his price was eight hundred pounds, and that no story of his was worth so much. However, this suited Stevenson at the time for his proposed cruise in the South Seas, for which he wished to purchase a yacht. A series of South Sea letters was a disappointment, as the moralist and not the adventurer had got uppermost. McClure remarks that 'Stevenson was the kind of man who commanded every kind of affection: admiration for his gifts, delight in his personal charm, and respect for his uncompromising principles. Underneath his velvet coat, his gaiety, and picturesqueness, he was flint.' When in Scotland McClure heard, through Andrew Lang, of the work of Sir A. Conan Doyle, and purchased the early Sherlock Holmes stories for twelve pounds apiece. They were not at first popular with editors, as being longer than usual. Rider Haggard was another author serialised. It is curious to read of Mr Rudyard Kipling's having offered his early published work to the Harpers, and meeting with rejection. Later McClure paid him very high prices for his work, as much as five thousand pounds for the serial rights of *Kim*.

The story of how Mr S. S. McClure established *McClure's Magazine* is of uncommon interest, as it was done on a small margin of capital and credit, and during financial trouble in the United States. At one time it was losing eight hundred pounds a month; later it was clearing one thousand pounds a month. What particularly sent up the circulation were series on Napoleon, Lincoln, and the Standard Oil Trust, this last series costing the magazine about eight hundred pounds for each article. Professor Henry Drummond, McClure's old employer Colonel Pope, and Sir A. Conan Doyle gave financial aid at critical moments. In December 1895 the magazine had a circulation of a quarter of a million. It had been a literary success from the first; now it was a financial success. McClure is generous towards the staff who have helped him, but seems to have used his own health with desperate prodigality, and suffered thereby. 'I started to go to college with fifteen cents in my pocket. I went to Boston to get a job with six dollars as my whole capital. I was penniless when I formed the syndicate. Working against odds of this kind,

without money or influence, had told on my health, already overstrained in my boyhood by hard work and poor nutrition.' In one of his talks with Meredith, McClure asked him to define genius. This is what the veteran novelist said: 'It is an extraordinary activity of mind in which all conscious and subconscious knowledge

mass themselves without any effort of the will, and become effective. It manifests itself in three ways—in producing, in organising, and in rapidity of thought.' It is evident that McClure possesses that quality so cleverly defined by Meredith, and by virtue thereof, like his countryman Alexander Irvine, has risen 'from the bottom upwards.'

THE CALCUTTA MAIDAN.

By R. HERBERT.

CALCUTTA has obtained some fame as the City of Palaces, but the appellation is wont to surprise those who visit her to-day. There are many fine buildings for the accommodation of Government officials, stately mercantile offices, and noble private residences in the European quarter; but, when compared with any Western city of importance, these edifices hardly constitute a right to the grand title. The explanation is that the old houses of the Europeans were built with broad verandas with stately pillars that gave them a palatial appearance; and this was much enhanced by contrast with small mud hovels invariably situated in close proximity. Both of these types of building are now disappearing; and Calcutta, though a finer city than before, has less right to the name of the City of Palaces than in her earlier days. She has much to be proud of in her great progress as a port, and in the sanitation that has made her healthy, though situate in an alluvial swamp under a burning tropical sun; and her pride in these matters has of late led her rivals in India to accuse her of suffering from swollen head.

But the chief external glory of Calcutta is the broad green plain known as the Maidan. To the cold-weather visitor it may seem overrated, and to him it may possess no greater attraction than Clapham Common; but let him stay in the city for a year, and see the spring and summer glories of this wide expanse, and feel the freshness that it affords in the midst of a terribly overcrowded and congested city in the hot, damp days of August and September, and his views will greatly change. The Maidan is the lungs of the city, the chief playground of the inhabitants of many races and creeds, and the chief charm of the town. It is some five miles in circumference and rather longer than it is broad. The expanse of grass is intersected by many roads; in the cold weather and the dry heat of April and May the grass is short and sometimes very brown, but for the most part of the year it is kept green by the heavy night dews. In the rainy season the grass grows thick and long, and is a great handicap to those who play golf and other games there. On the western side runs the river Hooghly; and overlooking it is Fort William, its barracks

and buildings surrounded by high earthen ramparts and a deep moat.

The Maidan is under the jurisdiction of the military authorities, and by their rules no permanent buildings are permitted upon it which would be of any assistance to an attacking force; hence the numerous sporting clubs that are allowed to use the grounds are only permitted to erect tents painted green to harmonise with the surrounding scene, or small and more or less portable pavilions. An exception has been made in favour of the racecourse, lying to the south of the Maidan, which has four high stands of brick and plaster. The old Presidency Jail, built before the fort, also had a site on the Maidan. The jail is now being demolished to make room for the gardens which are to surround the great memorial that is in course of erection to the memory of her late Majesty Queen Victoria. This memorial, a great marble hall that is to be used as a museum, was commenced some eight years ago; but the work was much delayed by the sinking of the foundations in the soft alluvial soil. Further delay has been occasioned by difficulty in obtaining the marble as it is required, and it is expected that nearly ten years will yet elapse before the building is quite completed.

The broad water-tanks in the Maidan were constructed many years ago for religious purposes, and also for the supply of drinking-water before Calcutta possessed a filtered supply. At one of these tanks are little dome-shaped buildings where in past years sentries took shelter from the fierce sun or heavy rain, their duty being to prevent the pollution of the water by natives. The tanks are also a feature of the town and the surrounding country, though a number of them have been filled up in recent years with a view to reduce the breeding-places of mosquitoes and the dangers of malaria.

There are two golf-links on the Maidan, one being for ladies; but the more popular links are a few miles out of the city. There are numerous cricket and tennis clubs in operation during the cold weather; in the early hot weather there are as many hockey clubs; and later, with the rains in mid-June, a great portion of the broad expanse is utilised for football. Until comparatively recent years few but Europeans

indulged in these games; but now the Bengalis have taken to them all, and show a special zeal for Association football. In the various clubs are people of many races, including Parsees, Armenians, Jews, and Eurasians. On a Saturday afternoon the scene is certainly somewhat akin to that on Clapham Common or Parliament Hill fields, except for the diversity of race and dress. The chief football matches arouse extraordinary enthusiasm, and crowds numbering tens of thousands surround the grounds and avail themselves of every inch of space that can afford a chance of a view. Hitherto little provision has been made for the vast crowds; but this is recognised as essential now, and there is talk of having a new ground for the principal matches, surrounded by permanent stands capable of accommodating several thousands of people.

To the north of the Maidan, where it nearly adjoins Government House and the business quarter, gardens have been made, one of which is due to the generosity of the two Misses Eden, sisters of Lord Auckland, the other to the energy of Lord Curzon. The Eden Gardens possess most pleasant sylvan walks, pretty lakes, and beautiful flowers; whilst in the centre a broad open space forms the grounds of the Calcutta Cricket Club in the cold weather. In one part is a bandstand, where a band plays on most days of the week, and attracts many people into the fresh open air. The Curzon Gardens are of more recent date, and present a very pretty scene late in the cold season, when many English annuals are in bloom, and afford a bright and lovely show of colour.

The Red Road, so called from the red soil with which it is laid, is the popular fashionable drive in the centre of the Maidan, railed off on both sides by a whitewashed balustrade, and open to every wind that blows. Well back from the road are statues of past Viceroys and Commanders-in-Chief. There are many more such statues on other parts of the Maidan, and the complaint is sometimes made that there are too many; but the number will probably receive little further addition now that Delhi has become the capital. However, those we have certainly adorn the Maidan. The most prominent erection on the Maidan is the Ochterlony Monument, a high column that may be ascended by a winding stair within, erected by public subscription in 1841 to the memory of General Ochterlony, who conquered Nepal, and distinguished himself greatly as soldier and statesman, but received little reward for his services. Government House, which lies to the north of the Maidan, is a noble building; but, being surrounded by trees which form somewhat of a jungle, it contributes little to the appearance of the Maidan. However, this will no doubt be altered, as the Trustees of the Victoria Memorial Hall propose the laying of a broad road, part of which will be the present Red Road, right across the centre

of the Maidan, connecting these two noble buildings. The general effect will certainly be a very fine one.

During the hot weather it is the resident that most fully appreciates the Maidan. After working during the heat of the day in an office where windows have to be closed to keep out the hot breeze and thick dust, where the hot air becomes fetid though kept in motion by the electric circulating fans, what a pleasure it is to meet the cool evening breeze on the Maidan; or to any one who has occasion to journey through the narrow lanes of the densely populated native quarter, with all its unpleasant odours and jostling crowds, what refreshment comes as he once more gains this open spot!

Of the history of the Maidan there is as yet no good record, though one would certainly be appreciated. Calcutta was founded by Job Charnock, a worthy servant of the old East India Company, in 1690. Charnock settled at a point higher up the river than the present Maidan, and the town that grew up was separated from the present site of the Maidan by a creek no longer existing. In those days a village stood where the fort is now, and all around it was a thick jungle frequented by wild beasts. As the town grew the wild beasts departed, but were succeeded by murderous robbers who infested the jungle and preyed upon pilgrims travelling along the road that led to the famous shrine of Kalighat, to the south of Calcutta. But as time went on this jungle was gradually cut down to supply the residents of the town with firewood, and a bare open plain came into existence. It was many years, however, before the European population obtained much refreshment from this open space; the dust of it was terrible, and no good road existed. In those days the residents preferred to take the air on the river, which they did in great boats known as budgerows, propelled by several rowers. These vessels were handsomely appointed, and their owners were wont to enliven their cruises with music. But the pleasure of such trips must have been somewhat modified by the unpleasant odours of the river and the many corpses carried by the current; for in those days it was the custom of the Hindu to throw his dead into the river quite regardless of the ill-effects to his fellow-men lower down the stream. This unpleasant practice has been almost entirely stopped by the British Government, though an occasional corpse may still be seen by those who go much on the river.

Succeeding generations have shown a preference for the Maidan, and the river is really used to-day far less than it should be by those in need of light and gentle recreation. In 1756 occurred the terrible tragedy of the Black Hole and the destruction of the old Fort William, which was situated on the river-bank about a mile above the present fort. The old fort was in the centre

of the town, and, save where it was bounded by the river, houses were in close proximity; hence it happened that Suraj-ud-Daula, when attacking it, was able to fire down with deadly effect upon the wretched garrison from the height of a neighbouring church tower. After the town had been regained the Council wished to build a new fort on the site of the old one, and had, indeed, made preparations to do so, when Clive appeared upon the scene, and, recognising the weakness of a fort in close proximity to houses that could afford cover to an enemy, promptly vetoed the project, and decided on the present site. So in course of time the new fort was built, and under the military regulations buildings were prohibited within a considerable radius of it. There can be little doubt, therefore, that, though he did not realise it at the time, in all probability Clive was responsible for the great Maidan that we possess to-day. The new fort was completed in 1781, and in the years that have passed since then the Maidan has altered but little, save for the planting of more trees, the improvement of roads, and the erection of statues. In the years 1864 and 1867 the progress of improvements on the Maidan was checked by two great cyclones that did enormous damage to the many fine trees.

The freshness and green of the Maidan greatly appeal; but maybe, to the visitor, the people on it are of more interest. During the heat of midday it is almost deserted, but in the early morning and evening there is always a good turnout. On a cold-weather morning the riding-track of the racecourse is crowded with the fashionable world of Calcutta, whilst on the training-track hard by the fine horses that come for the cold-weather meetings are taking their morning exercise, their movements being carefully observed by many bookmakers, trainers, and others interested in racing. On other parts of the Maidan golfers in shirt-sleeves and white flannels or ducks are pursuing 'the india-rubber idiot on the spree.' Soldiers and volunteers are generally at drill on some part of the Maidan, and crowds of natives are setting out to their day's work over narrow paths through the grass. Coolies going to the docks are numerous; thin and scantily clad in a single loincloth, they wend their way in single file, talking little as a rule, and when they do so it is usually of money. To the golfer and the rider these files of natives are often a great trial. Occasionally half-a-dozen or so will stop and play a game resembling our 'touch last,' and the observer feels some thankfulness that they are able to do so, for as a general rule they look far from happy, and are listless to the point of stupidity. A little later in the day the *babus*—educated men serving as clerks in many Government and mercantile offices—are streaming over the Maidan or being carried in the tram-cars that run over some of the chief roads; they look smug and complacent enough,

clad in white *dhotis* or nether garments, with a British shirt overhanging them, and maybe a coat or shawl of some bright colour. In the evening the same people may be seen returning to their homes, their day's work done. The evening is, of course, the chief time for play, and then the cricket, football, and hockey grounds are most patronised until the shades of night stop the play. During the cold weather the races that take place each week, and occasionally even more frequently, are a great attraction to Europeans and Indians.

In the month of April the Maidan looks its best. The short-lived spring is over; most trees have assumed their full summer garb of green, and the golden *mohur* has burst forth into the wonderful blossom of red-and-gold, gorgeous colours that have to be seen to be fully realised; the *lagerstræmia* (a tree with purple flowers) and *cassias* of different kinds display other hues of pink-and-white, all combining to give the Maidan a marvellous wealth of colour. The grass, too, favoured by some rain of late, is rather greener than usual at this time of the year, and the herds of cattle that are allowed to pasture there have reason to be grateful. In former years the Maidan roads were very dusty during this season; but frequent oiling and the laying of many of them with a kind of tar-macadam have greatly lessened the dust nuisance.

An aspect of the Maidan worthy of mention is that seen when the sun sets during the rainy season of July, August, or September. As the great ball of the sun sinks down beyond the swelling river the clouded sky presents a wonderful picture of colours that change from one shade to another as one looks on them, from the lightest pink, that suggests the faint flush on the face of a little child, to the deep angry red bordering on a jet-black cloud expressive of the bottomless pit. Orange and gold, purple and pink in every shade, gild cloud and sky long after the sun has departed, before the stars shine out, and the moon beams forth its silver radiance.

ORBIS PERITURUS.

LONELY swung the primal earth
Long ere man had come to birth,
Mountain, forest, flood, and plain
Rolling through the vast ~~space~~ ^{vacuum};
Naught of brute or human life,
Only elemental strife,
Flashes rending densest gloom,
Thunder's long reverberant boom,
Wind-borne hissing streams of rain
Lashing vacant land and main.
So once more, when life decays,
Time shall bring the ancient days,
And the brute earth, void of soul,
Again her lonely course shall roll.
Then in spirit realm may I,
From some vantage-point on high,
See the waste world onward sweep
Through the firmament's great deep,
Circling round the unheeded sun
Till time's course itself be run.

A. G. PESKETT.

Chambers's Journal

SEVENTH SERIES

A VOICE FROM CENTRAL AMERICA.

By E. W. PERRY, Tegucigalpa, Spanish Honduras.

GERMAN autocracy has told the world that might is the supreme right. It may be that the vast majority of the German people are not responsible for this dogma. German despotism announces that weak nations have not the same right to live as powerful and vigorous nations have. It maintains that it is right in making conquests whenever and wherever it may profit by so doing. That autocracy declares that its solemn promises are as 'scraps of paper,' to be torn to shreds at the will of the stronger, without regard to the wishes or rights of the weaker. That Government holds that the State is above all morality, all honour; that whatever seems necessary, in the opinion of its ruler, is moral and honourable.

Germany is openly fighting to secure monopoly of power to rule the world. For this her autocratic ruler and his adherents are sacrificing servile hosts in what we may hope is the death-struggle of autocracy. For this purpose Germany has fitly allied herself with the Turk, that embodiment of fanatic hatred of freedom and development, and with other decadents. Should Germany succeed in this fight, what can be the final logical result other than slavery for all except the chosen few—probably the Hapsburgs and Hohenzollerns, with their many members of physical, mental, and moral deformities? Should Germany win in this greatest of wars she would gain the undying hatred of all friends of that spirit of democracy which has fought through centuries, winning battles for more nearly equal justice, opportunity, and reward for all. Even if victorious, Germany would be the loser.

France and Great Britain, and their colonies, and the United States are the most formidable obstacles to the realisation of the ambitions of the Hohenzollerns; therefore Germany has warred against them, persistently and secretly, for decades. Germany is now charged with having been the chief cause of whatever friction may have existed between Japan and the United States. She is more than suspected of being the principal cause of the anti-American sentiment that has swept over Latin-America in the last fifteen or twenty years.

All peoples having for their ideal a representative Government, democratic, republican, or monarchical like that of Great Britain—really

a republic having a hereditary president—must be enemies of all principles and purposes like those announced by Germany; consequently at heart foes of Germany in this war. Latin-America is especially concerned in this vast combat, because the territorial integrity, the autonomy, the very existence of these republics, as such, have been and are menaced by Germany. It is quite well known that Germany's purpose in causing friction between Japan and the United States, in stirring and aiding Huerta of Mexico, in labouring to plant and to cultivate throughout Latin-America fear and hatred of the big republic, was to prepare the way for a breaking down of that American doctrine which has been the one and only bulwark against the absorption of Latin-American territory by certain European Powers.

In November the Brazilian Minister at Holland said, in a published interview: 'A crushing defeat of Germany, that would free France from that anxiety which has been her state during the last four decades, would favourably affect South America also. Her three principal countries have been spending great sums of money to increase their armaments, destined against themselves, to defend them against foreign aggression, principally by Germany, whose coveting of the south of Brazil has been more than notorious enough.'

To make clear the attitude of Germany, set out with the bluntness of overconfidence, a few statements made by men recognised as leaders and exponents of German thought may be quoted. Nobody who knows what the German Government has done to those who published matter displeasing to these authorities will be able to believe that a General in the German army, a professor in a German school, or other employé of Germany could give wide publicity to the statements quoted below if they were not dictated, inspired, or at least tacitly approved by that Government. Moreover, so far as I have learned, no German authority has seen fit to repudiate these utterances, or even to deny that they fairly represent the opinions or the designs of that empire. Instead, the tendency seems to be to uphold them. Therefore the German people will be held responsible for all that these declarations of principles and of pur-

poses may fairly be taken to imply, until proof shall be given that they mean something quite different from the obvious meaning. Treitschke is held to be Germany's greatest historian and exponent of the thought of the German people. He is quoted as saying: 'A State's highest moral duty is to increase its power. It is justified in making conquests whenever its own advantage seems to require additional territory.' In what does that differ from the ideas of the most primitive and predatory savage? Again, he says: 'The State is the sole judge of the morality of its own actions. It is, in fact, above morality. In other words, whatever is necessary is moral.' Not what is necessary to the less powerful for war, whatever may be their intellectual or moral attainments and value; but whatever may be desired by the man or clique who can muster the larger force for murder and looting—that is, greatest ability to destroy the works of man's art and toil, and to annihilate men, women, and children, is the supreme right.

Latin-Americans are naturally deeply interested in the doctrine taught by Treitschke, and manifestly adopted by his masters, the war-lords of Prussia, that 'weak nations have not the same right to live that the powerful and vigorous nation has.' That may be taken as warning that no nation of any part of the world will be safe from loss of its existence if Germany desires to seize its territory and destroy its national life, should that nation happen to have less military strength than the Hun has. Nor can any nation trust to any treaty or other promise Germany may give. She herself has, in the most emphatic way possible, assured the world that she will act on the theory announced by Treitschke, as follows: 'Treaty rights are never absolute rights; they are of human origin, therefore are imperfect and variable. There are conditions in which they do not agree with the truth of things. In such case infringement of the right seems morally justified.' In other words, a national pledge is valid so long only as its giver sees fit to hold it so, if the giver is the stronger of the parties to the agreement. A national promise or treaty has, therefore, no value for the weaker party. According to this, whatever may be the promises by which Germany secured the aid of the Turk, she will be consistent if she deems it expedient to ignore them when the Turk shall have done all he can to help her in her distress; and this seems to be German honour!

Professor Hugo Münsterberg says, in his book, *The War and America*: 'It is easily said, and the average American likes to say it, that nations ought to respect the possessions of other nations, as individuals respect the private property of their neighbours. But this apparently highest morality would be the grossest immorality.' The average American does like to say, and his Government likes to act in accord with

the saying, that nations ought to act at least as honourably as the individual should. Moreover, the vast majority of Americans prefer that their Government should act generously rather than exactly when a doubt arises as to the precise interpretation of rights.

German rulers and statesmen have employed writers and others, through four decades, to instil into and to fix firmly in the German mind the notion that their God-given destiny is to rule the world. This would be to give to a couple of families a monopoly of government, and all that that implies. This faith became so strong that officers of the German army were permitted, if not instructed, to declare war on France and Great Britain, unofficially, as General von Bernhardi did in 1911, when he said, in his book entitled *Germany and the Next War*: 'In one way or another we must square our account with France if we wish for a free hand in our international policy. . . . France must be so completely crushed that she can never again come across our path.' Who can believe for a moment that that expression was not known and approved by the German military authorities before printer ever saw it? Who will deny that it was in effect a declaration of war, as the planting of mines in the open seas was in effect war upon all neutral nations owning ships or sending passengers over these seas?

As to Germany's attitude and intentions toward Great Britain, and the earnest efforts of the latter to avert war in Europe, General von Bernhardi wrote: 'Even English attempts at *rapprochement* must not blind us to the real situation. We may at most use them to delay the necessary and inevitable war until we may fairly believe that we have prospect of success.' That is, pretend friendship until the moment has come for stabbing the friend and advocate of friendship. Truly these quotations from her own acknowledged exponents show plainly how fit are the German rulers—the German autocracy—to be the sole judges of morality. Manifestly, to them the blackest treachery is the highest morality.

General von Bernhardi says, further: 'The situation in the world generally shows that there can be a short respite only before we face the question whether we will draw the sword for our position in the world or renounce such position once for all.' Which may be taken as meaning that two families of Germany had decided that the time was drawing near for seizing whatever they might wish to take, to put and to keep them in such position as they might deem desirable, whatever rights were violated. According to their pronouncements, no consideration of the rights of humanity, no regard for what the civilised world agrees upon as justice, international equity, or morals, was to be suffered to stand in the way of their ambitions.

To the democratic New World the fact that

many Germans seem to be still bound by ancient traditions so thoroughly as to believe in the divine right of kings might appear astounding if it were not manifest that such belief must be a valuable asset for kings and their adherents, therefore to be cultivated carefully. The hereditary head of the German Empire has himself given evidence that he believes, or pretends to believe, in the divine right of kings. He has been quoted as saying in effect that he was chosen by the Supreme Power to force German culture upon all the world, as having said practically that 'myself and God' are partners in a political deal whereby Germany was to profit greatly. If he were frank enough to say that all this was to be for the greater profit of the Houses of the Hapsburgs and the Hohenzollerns, the Krupps, and other partners in the business of murder, and for the 'glory' of the German Empire, he would have been much nearer the truth.

If the world misjudges the German people in these matters, is the blame that of the world? Have not Germans themselves often assured the world that their ideas of culture are to be forced upon all people? Have not their own famed authorities, teachers, and officials told the world that no consideration for the rights of others will be allowed to hinder the ambitions of Germany? Has not Germany herself, through many years, been giving proof that to her the only right comes by cunning, by spying, by treachery, by savage strength and force destructive of property, of health, and life? Among evidences tending to show what that despotism would be, as a master, may be cited the treatment accorded to their own women, the cowardly maltreatment of her own soldiers and of her working-classes, the worse than cowardly assassination of unarmed people, the savageries inflicted upon defenceless women and children, upon nuns and priests, upon peasants and other non-combatants, surrounded by a host of armed men.

Such, by their own showing, are those who would wrest their territory from nations that may be weaker than the aggressor, now or in the future. Such are they who have beguiled Latin-Americans through a decade or more. Such are the forces that have maintained publicity bureaus, perhaps including the 'German-American Chamber of Commerce,' so thoroughly discredited, and other agencies, to persuade public opinion that Germany is fighting for her national life against enemies bent on destroying her because they fear and are jealous of her progress in art, in industry, and in wealth. That these nations have feared Germany is not denied. They would have been foolish had they not feared her. Practically, all the civilised world, particularly the weaker nations, had ample cause for fearing her. She boldly threatened their peace, their safety, their very existence. She frankly menaced the property, the liberty, the

life of the citizens of every one of these nations. Her very existence as an autocracy has been, and must continue to be, a serious danger to every one of them unless her millions shall be for ever freed from the despotism that holds them subject.

Is it unjust to accept her public and uncontradicted utterances as a true exposition of the policy of Germany? Could such utterances be circulated and discussed openly and publicly in Germany, in the United States, and elsewhere without repudiation by officials of the State were the declarations not approved? These exposures are of supreme importance to Latin-America, because these republics offer great temptation to any Power having a population greater than can be supported by its home territory. German designs threaten and most seriously endanger the integrity, the very existence, of these republics.

So far as may be judged by public expressions, the meaning of the facts cited is dawning upon the thinking classes of Latin-America, and they show strong sympathy for the cause of France. It is imagined that this sympathy is because of the Latin blood in these countries; but, as this is really a minute quantity, the likelihood seems to be that the sentiment comes really from an instinctive feeling that the principles of republicanism, for which France has so long stood, are the basic cause of this war. Evidently it is mainly for these principles that the Allies are battling; they are therefore fighting for all representative Governments, whatever their characteristics. They war to save all nations from the plots of the coterie that has intrigued, bribed, and spied, has drilled its vassals, has crushed its people under taxation to pay for munitions, all for the avowed purpose of making the world pay tribute.

The Allies are fighting the greatest of all wars for human freedom against medieval despotism, peonage, and all the other evils that term implies. Are not the Allies fighting, then, for the cause of the submerged millions of Germany also, the millions that have been kept down through the ages, and would still be ground in the dust by the iron heel of the Prussian? Does not success for the Allies promise freedom, peace, and development for these German millions? These people heard the call of the spirit of liberty. They showed restiveness under the clutch of the 'mailed fist.' They evinced growing strength and a determination to take a larger part in the government of their own national affairs. Was not that increasing restiveness, with its demands for a larger part in regulating the affairs of the people, seemingly silenced for the moment by the uproar of war, really one influential cause of this sudden outbreak? Did it not force the hand of the plotters?

Destruction of the German autocracy should give to the German people such freedom as has developed the manliness, the daring, the enter-

prise, and welfare of so many other millions. That destruction should give to Germany's industries, arts, and sciences such liberty as will greatly help them to become a mighty force for the good of all humanity. It should make that force a secure protection against, instead of a help to, a power that would make all mankind submit to the caprice of the very few.

That Germany, bound by shackles riveted by monopoly, bowed to the dust by enormous burdens fastened upon her by Prussian war-lords when she should have continued peaceful and

prosperous—that is the Germany which, despite her enormous loads, developed the culture of which her despots boast, as if they had helped it, instead of hindering it in innumerable ways. Should not every enlightened nation throw all its weight into the scale against that tyranny, that autocracy? Must not all the weaker nations, for self-preservation, give all they can, even to the last dollar and the last man if necessary, to defeat that robber gang, to avert boldly threatened destruction of their own entity?

THE BRIGHT EYES OF DANGER.

CHAPTER XVII.—IN WHICH I EAT AND DRINK, AND AM NOT MERRY.

ON my way to the lawyer's house I questioned a chairman, who confirmed the news that Sir John Cope was landing at Dunbar, and told me that Charles Edward was to move out of the city to meet the English forces.

The long Writer to the Signet gave me welcome. He was a bachelor, and a man of good cheer. Mr Allan Ramsay arrived at my heels, and the three of us sat down to an excellent supper, served *more Scotico*—to wit, rizzared haddocks, a couple of roasted hens, and some toasted cheese as good as any I ever tasted in Westmorland.

The blithe little poet bubbled with excitement. He was full of stories of the Chevalier—his good looks, his royal mien, his chivalry and generosity to his foes, and so forth—until Mr Scott was moved to quiz him a little.

'All very well, Allan,' quoth he; 'but here is Mr Layton, a Whig, and mysel' the same, sittin' (at my ain table no less) listenin' to black treason. Are ye no' feared for your heid, man?'

'Deil a grain, Peter,' said the poet, 'unless it be through this grand claret of yours. 'Tis undeniable!'

'A safe vintage, Gramond's best. Ye might drink a quart without pullin' bit. There's no' a headache in it;' and the 'tappit' hen was replenished again.

I was a novice, careful in my drinking, and somewhat astonished at the amount of liquor the two old friends disposed of without apparent effect on their speech or bearing. Beyond an occasional raising of their voices in bantering argument, and a mellow twinkle in their eyes, they might as well have been drinking twopenny ale. They toasted each other, and they toasted myself. They drank the health of persons and abstractions whom I had never heard of, and drained glasses to 'sentiments' such as 'Auld Reekie, may her lums ne'er reek less!' and 'Stuart or Hanover, and may friends ne'er cast out!'

I had no ingenuity in these diversions, but contrived by swallowing my claret in canary-

like sips to avoid the appearance of peculiar abstemiousness.

A couple of hours passed before there came a lull in the genial flow of toasts and sentiments.

'I doot we're at the slack o' the tide, Peter,' quoth the poet. 'Gin Mr Layton here has tint his tongue (as his modesty gars him say), he may find it in a stave or two o' a song. What say ye?' And the glasses danced with applause at his suggestion.

I had been as dumb as a fish, and in any other company than this kind and jovial one would have been ignored for a dullard and a wet blanket. So I on to my feet and gave them, as well as I could, 'The Maid of Kendal' and 'Down the Fell.' The plaudits were renewed. They were kindly meant, but little enough merited, for my voice was of the hunt-breakfast order, with considerably more body than music in it.

Allan Ramsay came over and sat down beside me.

'Ye'll tak' wine wi' me,' he insisted, and asked leave to write down the words of the ballad 'The Maid of Kendal,' for it was new to him; and when I repeated them he was kind enough to say, 'Ye sang it wi' great feeling, sir,' and took oath that I was in love, which he commended as a very wholesome state of mind for all young men. 'It cleans the heart,' said he, 'and braces a man whether he wins or loses; and I make no doubt ye'll win, Mr Layton, if indeed you're not that length already. If not, "Forth, Fortune!"' His smiling air of sharing a secret as he clinked glasses with me would have thawed a misanthrope. Then the lawyer would have a song from Allan, and none other than one of his own writing. Part of it ran:

*Wat ye wha I met yestreen,
Coming down the street, my Jo?
My Mistress in her tartan screen,
Fu' bonny, brave, and sweet, my Jo.*

The words so chimed with my thoughts that I started involuntarily; but both the singer and

my host were trolling away with great enjoyment, and paying no concern to me. Little Allan strutted back and forth, neat-footed, with short steps, singing the lines in a high, windy voice, with no great skill, but with much spirit and gusto, and so manifestly pleased with his composition and performance that it was a pleasure to see him, and I made haste to compliment him on both.

'Ye may well say so,' our host chimed in; 'Master Allan Ramsay is a man o' many parts. To tell a story or declaim a scene, say, from *The Gentle Shepherd*, or it might be *The Evergreen*, is as easy for him as drawin' his breath.—If I might venture, Allan, we'll draw to the fire. I'll brew some toddy, and ye'll maybe mak' an hour jink by wi' a story or twa.'

He threw another log on the fire, and with much care and seriousness set about compounding a potent browst. Allan Ramsay had great store of old tales and jests—some of them not over delicate concerning later day Edinburgh notables—and the lawyer was very little behind him. I politely declined more refreshments, and sat listening with what interest I could. But my mind was preoccupied; and not once, but often, my host twitted me with the loss of my tongue.

'Come, Mr Layton, I ken ye have many a story, if we could but rouse ye!' quoth he.

Then and there I made up my mind to let them have my experiences of the last few days.

'If you will have it, gentlemen,' I made answer, 'I have a story, and you shall hear it. I deserve all the rallying you give me. In very truth, my wits have been wandering. But if my story is ill told by comparison with your merry ones, it has the merit of being true and strange, and you can judge whether it may not have given me something to think about. If you will get me the book I left with you, Mr Scott, I'll take my text from it.'

'The book?'

'The book that I left with you.'

'That will be an easy matter, for I locked it past wi' your papers in my office,' said he, and went out, returning in a minute or two with my Virgil under his arm.

I opened the little volume and read the copy of the secret paper.

'To begin with, can you make anything out of that?' I asked.

Mr Scott whipped out his spectacles, snuffed a candle, held it to the book, and the two men, vastly interested, scrutinised the wording.

'There is only one word here that kittles my memory,' said Scott.

'I ken it.'

'Glenira!' came from both of them.

'Ay! it is an old story, thirty years since, Mr Layton. I was but a halfin boy then; but Allan here is the very man to jog my memory

and put us on the road. I hope to unravel this unchancy business; I hope so, sir.'

Allan Ramsay was staring at my writing, pursing his lips in thought. 'Glenira is—or was—Evan Macdonell of Glenira, on Speyside. He was a young man in the "Fifteen," and "came out." I ken some o' the sorrowful story. Glenira had a narrow escape; but he and his younger brother Colin, disguised as sailors—so the story runs—got off from somewhere on the Moray Firth. The estate was forfeited, of course; but I remember readin' in the *Gazette*: "The King's Majesty, of his pleasure, being well assured of the loyalty," *et cetera, et cetera*—ye ken the stuff!—gave the estate to—whom, think ye? Glenira's own cousin! Damn him!' He shot out his words with sudden vehemence, the veins swelling on his forehead.

'You know him?' I asked.

'I met him once. He had the effrontery to reflect on my pedigree, Mr Layton; but, faith! I let him ken that a Dalhousie Ramsay was upsides wi' ony Hiellan' cattle-thief that ever turned his back on his clan and louted to Hanover.'

Mr Scott, standing behind him, slowly closed one eye at me and smiled. 'Everybody kens that your blood is gentle, Allan,' quoth he dryly. 'But concernin' Glenira?'

'More I cannot tell. A whisper would come now and then, years ago, from France, but that was all. Poor Glenira was put to the horn at the Cross and the Pier of Leith, and if he is in this country I'll warrant his claymore is wi' the Prince. But I'm thinkin' that he must be under the sod. I saw him once, a kenspeckle man, one to turn round and tak' a second look at, very tall, dark as an Egyptian, a fine heid, and e'en as fiery as a hawk's. Indeed, his by-name in the North was "The Kestrel."'

'The Kestrel!' I stood up, my pulses galloping. 'He is not with the Pretender. I have seen him!' I cried. 'I have seen him within the last forty-eight hours.' I checked myself. I may have said either too much or too little.

Mr Scott saw my hesitation. 'Be assured,' he said, 'that what you have to say is safe wi' Allan Ramsay and myself; and, further, ye are young, and may stand in need o' counsel.'

Straightway I told him the story of my stumbling against the house of The Garth, the fight, the girl, my wound (I showed them the scar), my detention, the secret passages, the tall blind man, the hidden paper, my lair in the brackens, and my hairbreadth escape. The two men listened greedily, punctuating my recital with 'God save's!' 'Sirs! sirs!' 'That cowes a'!' and such like.

'Let me see your book again, Mr Layton.—You are a skilly man in documents, Peter. What d'ye mak' o't?' said the little man. 'This is a serious business—a serious business!'

The writer put on his spectacles again, and pored over my copy.

'It was never meant for a cipher. The blanks, ye tell me, Mr Layton, bore traces o' writin'?'

'Plainly, but blurred and illegible, through sea-water or some such accident.'

He shook his head. 'That's the peety o't! It's a chart, like enough, o' something, or—save us! somebody's bones, it may be—hidden. We need the missin' words, or I doubt we're foun-dered. But for the rest we can piece together enough, I think, to draw at the least a reason-able inference. The letter found in your saddle-bag spoke o' "the Kestrel" bein' found in this country. The leddy's name is Mistress Charlotte Macdonell, and the man you saw in the cave—a man nearer sixty than fifty—was a giant, and dark.'

'Coal-black hair, and the handsomest and noblest-looking man I ever saw.'

'The chances are that he is Glenira.'

'Chances! It is the man himself!' cried Allan; and they fell to splitting threads and theories until I intervened with the suggestion that Mr Scott might find who was the owner of the house of The Garth.

'That should be an easy matter. I'll make discreet inquiries. But be he Glenira, or the devil himsel', what need for your thrustin' your hand farther into this than ye can draw it back, Mr Layton? I would gang warily—warily, sir!'

This was first cousin to the advice Walter Irving had given me, and doubtless, like his, well meant. I cast about for a reply, when Allan suddenly, without a smile, but with a twinkling roguish eye, looking me straight in the face, struck up:

*My Mistress, in her tartan screen,
Fu' bonny, braw, and sweet, my Jo!*

I coloured, I am sure, to the roots of my hair, and bit my lip in mortification.

'Weel, weel! Will to Cupar, maun to Cupar; but it is a gey business courtin' wi' bullets whistlin' about ye,' said he.

I suppose I must have looked embarrassed, for the little man laid a kind hand on my

shoulder, with 'No offence, Mr Layton. I'm a romantic, haverin', writin' character, and whiles am apt to let my tongue run awa' wi' me. It makes enemies, no doubt, but none among folk o' sense and o' good stock, as I ken ye to be.—Come, gentlemen,' he broke off. 'The cool o' the mornin' often reddes up things that look agee by candle lowe. This affair o' The Garth will be none the waur o' bein' slept ower. A night-cap, friend Peter, and then ye can light us down the stair!'

Before the last dram, Mr Scott produced some deeds for my signature, which Allan and he witnessed, their writing as clear and steady as though they had been drinking spring-water instead of enough claret and spirits for half-a-dozen ordinary men. Then he busied himself again with the mysteries of toddy-mixing—it was a tribute to the recital of my adventure that the original toddy was nearly stone cold—and the two friends drank in the new brew to each other and to long years and happiness in Darehope to myself.

It was long past midnight when the little poet and I gave our host good-night. I shook hands with Allan Ramsay at the corner of the street after many promises—I had doubts whether he would remember them—to make free of his house and friendship, and then set my face homewards.

It was a still morning, the moon floating serenely like a silver boat in the indigo sea of the night. Few lights were visible, save the Castle signalling steady defiance to Holyrood. Patrols of the Highland army, wrapped in their plaids against the night air, passed back and forth along the street, carrying a medley of weapons, strange menacing shapes in the night, the moonlight striking on claymore and Lochaber axe.

The town slept. Once the hoarse voice of a Highland watch calling the round rippled the quiet, and once the last long note of an English bugle high above me trailed into the darkness like a star. Then came stark silence.¶

I was not challenged, reaching the hostelry as the old night watch called a quavering 'Twa o'clock, and a fine dry mo-ar-r-nin'!'

(Continued on page 260.)

PROPHECY, PRESCIENCE, COINCIDENCE.

By C. R. HAINES.

ONE who was 'of imagination all compact' compared it to Adam's dream: 'he awoke and found it true.' In the domain of letters, more especially of poetry, there have been some striking exemplifications of this saying. The words of great creative writers are often more full of meaning than they ever thought of, and capable of a far wider application. So Shelley,

in his *Witch of Atlas*, written in 1820, spoke of

Those mysterious stars
Which hide themselves between the Earth and Mars.

He was probably thinking of the asteroids which lie beyond the orbit of Mars; but he built his rhyme better than he knew, for before that century was out—to be precise, on 13th August

1898—a minute planetoid, since named Eros, was sighted where Shelley had imagined it. But far more wonderful, because the result of scientific acumen, was Dean Swift's mental telescope one hundred years earlier. It will be remembered that Dr Gulliver on his visit to Laputa found the astronomers there possessed of telescopes far more powerful than ours. With these they had discovered that Mars had two satellites revolving round him. The fact that the Earth had one moon, and Jupiter, the planet beyond Mars, had (or was supposed till then and long after to have) four moons, would naturally suggest for Mars the symmetrical adjunct of two companions. But the Dean's divination was able to pry farther into the unseen and the unknown, for he told us that 'the innermost satellite was distant from its primary exactly three of its diameters [that is, twelve thousand miles or so], and the outermost five; that the former revolved in the space of ten hours, and the latter in twenty-one and a half.' In spite of this signpost to the truth, more than a century later Tennyson could still sing of the 'snowy poles of moonless Mars;' and it was only in 1877 that Swift's empirical astronomy was verified by the discovery of two tiny attendants on the planet, revolving round him, the one in thirty and a quarter hours and the other in seven and a half, at a distance of six thousand and fifteen thousand miles respectively. Swift's guess was a wonderfully close approximation to the truth, and all the more extraordinary as, till the discovery of these satellites, no instance was known of a primary taking longer to rotate on its axis than a satellite to revolve round it.

It was, again, prescience more than imagination that enabled the author of the *Botanic Garden* of 1791 to write:

Soon shall thy arm, unconquered steam, afar
Drag the slow barge or drive the rapid car;
Or on wide-waving wings expanded bear
The flying chariot through the fields of air;

since the discovery of a way to fly was only a question of time. And the same may be said of Byron's lurid and realistic prophecy of the Mutiny in India which appeared in his *Curse of Minerva* (1811). This was perhaps inspired by the abortive rising at Vellore in 1806:

Look to the East, where Ganges' swarthy race
Shall shake your tyrant empire to its base;
Lo, there Rebellion rears her ghastly head,
And glares the Nemesis of native dead;
Till Indus rolls a deep purpureal flood,
And claims his long arrear of Northern blood!

But perhaps the two most famous of all literary prophecies have been Seneca's prediction that in the distant future old Ocean's fetters should be broken and an immense New World be revealed beyond the limits of distant Thulé, and Virgil's unconscious testimony to the birth of an 'Offspring of Heaven' that should renovate the world. On this account Christians of later

times ranked this poet with the prophets of Holy Writ. The lines, as every one knows, are found in the Fourth *Georgic*:

Take Thy power and reign, for now is the time
appointed,
Germ of a Jove Almighty, beloved Offspring of
Heaven!
See how the great round world is rocked and reels
at thine advent,
Earth and the sky's deep vault and the broad
expanse of the ocean;
See, in joy at the new-born age, all nature is
smiling!

Like the words of Caiaphas, recorded by St John, Virgil's imaginative apostrophe to a Saviour of the World was true in a higher sense than he intended; and, indeed, in the early years of the new era there prevailed throughout heathendom, as Suetonius tells us, a firm belief that 'at this very time would come forth from Judæa those that should rule the world.' But hundreds of years before the divine Plato had penned this amazing forecast of the reception which the truly Just Man must expect among men. He represents Socrates as saying: 'Though the doer of no wrong, He [the Just Man] will be reputed the greatest of wrongdoers. He will go forward unshakable even to death, appearing throughout life, albeit just, to be unjust. He will be scourged, and last of all, after suffering every kind of evil, He will be crucified.'

The vogue gained by Virgil among Christian writers caused his works to rank with the Bible as a medium for divining the future by means of the so-called *sortes Biblicæ* or *Virgilianæ*. The method of taking these was to open the book at random, and read the first words upon which the eye lighted, which were then taken as oracular of what was to befall. The most notorious instance of this was when the 'fair and fatal king,' while at Oxford at the beginning of the Civil War, tried his luck with a volume of Virgil. He opened it at the terrible lines in the Fourth Book of the *Æneid* which embody Dido's curse:

Let him be whelmed with war by some fierce foe,
And, from his children torn, to exile go;
And plead in vain, and see his dear ones lie
In death dishonoured, and though peace he buy
With shame, yet reign and life be his no more,
Cast ere his day uncoffined on the shore.

The heart of Charles must have quailed before so dire an omen!

It might have been supposed that questioning the Bible for omens was obsolete in our day; but we know that the mysticism of General Gordon made him on occasion try this method of inquiring at the oracle of God. But this was only in cases where his moral course was not quite clear to him. He needed no such substitute for his own natural insight and prescience, shown in his wonderful forecast of Germany's naval progress. In 1882 he uttered these remarkable words to Captain J. R. Pardy: 'So far as England is concerned, she need not, for the next

quarter of a century, be under any apprehension of serious difficulties arising with any of her European neighbours; but in 1910, or thereabout, there will have arisen a naval Power which may prove mightier than she; and should she—Germany—gain the supremacy, England will become extinct both as a sea and a land Power, and all her dependencies, including India, will fall into Germany's clutches. You may live to see this; I shall not; but when that time comes remember my words.'

A prophecy almost as striking was quoted by Mr A. Forbes of Aberdeen from the *Agricultural and Industrial Magazine* for 1835; but as it refers to a highly controversial subject it need not be quoted here.

A curious instance of the application of Biblical prophecy to modern events was brought forward by certain occult mystics at the time of the Berlin Congress. 'In those days,' says Zechariah (viii. 23), 'it shall come to pass that ten men out of all the languages shall take hold of the skirt of him that is a Jew, saying, We will go with you.' There were ten representatives of the Great Powers present at Berlin, and Beaconsfield, a Jew, imposed his views upon them.

During the Laud celebration in 1895 Bishop Collins brought to light an extraordinary coincidence—or shall we call it prophecy?—which occurs in the title-page of a book published in 1641: '*Farewell Myter, or Canterburie's Meditations in Wren's Syllogismes. The Devel's Moane for the Discontent of his Servants . . . inserted the 12th day of the Moneth Tridemiter according to the infernal Collateration Peccandi, An. Dom. mccccxv. By Richard Newrobe . . . in the year 1641.*' Thus the very year of the celebration was anticipated.

But what is coincidence, that blessed word that explains away for the sceptic so much that is inexplicable? Was the dream of —, the — murderer, which apprised the condemned man that he would not be hanged, a coincidence? He stoutly affirmed to the jailers who took him to the scaffold that he could not be hanged. After several failures in the attempt to hang him, he was taken back to his cell, and afterwards reprieved, since which he has been released. The murder he committed was one of the most brutal and basest possible, and it goes against the grain to think that Providence interfered to save such a criminal.

For pure coincidence there is nothing to surpass the following series of accidents: On 5th December 1664 a boat crossing the Menai Strait was upset, and only one passenger out of eighty, named Hugh Williams, was saved. In December 1785 another boat was similarly upset, and of all the sixty passengers only one was saved, Hugh Williams again. On 5th August 1820 a similar disaster occurred for the third time, and of twenty-five persons on board one alone

survived; needless to say his name was Hugh Williams! Common though that name may be, how many millions to one are the chances against such a repetition of the same occurrence?

Of a somewhat different kind, but even more marvellous, cases of coincidence between fact and fiction are to be found in literature, cases where the coincidence extends even to names of persons, and even prophecy is debarred from naming persons before their appearance in the flesh. In a novel written by an Anglo-Indian, the *Castle of Saltwood*, near Hythe, was described as coming into the hands of a family with the usual intricacies of a lost or hidden will. On the writer's return to England with the manuscript he found that actual facts relating to that very property were almost identical with his imagined ones.

Those who have read *Armada*, by Wilkie Collins, will be in a position to appreciate the wonderful similarity between that tale and the following facts. In November 1865, when thirteen monthly parts of *Armada* had come out, more than eighteen months after the complete story had been sketched in the author's notebook, a vessel lay in Huskisson Dock, Liverpool, looked after by one man who slept on board as ship-keeper. One day this person was found dead at his post in the deckhouse. On the next day a man engaged to take his place was carried out dying. A third appointed to the same duty was found dead the next day. The name of the ship was the *Armada*, and the three men had been suffocated by sleeping in poisoned air.

The eminent writer Mr Rider Haggard set forth in the *Spectator* for 19th October 1907 some most curious particulars about his story *Fair Margaret*. The hero is Peter Brome, whose father is stated to have been killed at Bosworth Field. Now it appeared from facts supplied by Colonel Brome Giles that there was a real Peter Brome, and that his father had been killed at Bosworth Field. But the novelist had invented the name, and had never heard any of the details about the family which he had woven into his story. Mr Rider Haggard astonishes us still further when he says that the same sort of thing has occurred at least four times in his own experience; while a case of a similar kind was described by another well-known novelist lately.

But even the above are scarcely so marvellous as an instance never noticed except by the present writer. On 19th May 1884 a yacht of thirty-three tons, named the *Mignonette*, sailed from Southampton with four hands on board—Thomas Dudley, Edwin Stephen (mate), Edmund Brooke, and Richard Parker. She foundered on 5th July in latitude 27° 10', longitude 9° 50'. The crew got off in an open boat, with but two tins of turnips for food. On the third day they opened one of these, and lived on it for two days. On the fifth day they caught a small

turtle in the open sea, and lived on it for a week. Then they ate the second tin of turnips; after which they were eight days without food and five without water. On the twentieth day Parker was bled by the master and killed, the blood being drunk by the other three, and his body fed upon. On the twenty-fourth day they were picked up by the *Montezuma*, nine hundred and eighty miles from where they had started. Now E. A. Poe wrote a very powerful but unfinished story called *The Narrative of A. Gordon Pym*, in which he describes how two school friends, Pym and Barnard, went to sea in a whaling-brig. There was a mutiny on board, and the captain and others were turned adrift in an open boat. But Barnard and Pym and one of the mutineers recovered the ship, killing all the crew except Richard Parker. A storm on 10th July made the brig a wreck, and the crew of four were cut off by water in the hold

from all their provisions. After they had subsisted for six days on a bottle of port, lots were drawn to decide who should be killed and eaten. The lot falling on Richard Parker, he was stabbed and his blood drunk. For the next four days the body supplied them with food. They subsequently got at some of the provisions on board, and found a tortoise of the Gallipagos kind, which carries a little bag of water at the root of its neck. On the twenty-eighth day after the wreck the survivors were rescued, when they had drifted twenty-five degrees. *A priori*, we should have expected E. A. Poe, with his weird imagination and mental uncanniness, to go very far in such species of intellectual prognostication, and it cannot be denied that he comes fully up to our expectations in this foreshadowing of fact by carefully elaborated fiction.

But will the coincidence theory explain these and countless other instances?

THE STRANGLERS OF POLP.

CHAPTER III.

ALONE in his own room, the Duke tossed his coat to the bed, and, having trundled an arm-chair to the fire, sat down in it. He had said that he was tired, but his alert bearing belied the statement.

For two or three minutes he seemed placidly content with his thoughts, while he continued to finger absent-mindedly that ghoulisn bracelet on his left wrist. Then the stroke of a clock made him glance at his watch. A quarter to seven!

'What! no more than that?' he whispered.

But he soon realised that, although much had happened for his instruction since his return to the hotel, the main sensational incidents had taken but little time from their beginning to their surprising conclusion—the blessing from that well-nigh incredible yet extremely interesting young man who—

Suddenly he did a strange thing. Detaching the garrotte from his wrist, he looped it round his neck and made a brief but violent experiment upon himself.

'That will do; my faith, yes!' he murmured afterwards, with a laugh that was almost a chuckle. 'They have a trick about it, I have heard, which kills very quick. Yes, probably I have had a closer shave than I supposed. Perhaps'—

But a vision of his wife Adela stole upon him, and he crossed himself. He was a Catholic, and he had not spoken extravagantly to Shemstein the banker in his allusion to her letter of that morning as a talisman. The prayers of so sweet a saint for his protection and the welfare of the country to which (as she believed, and sometimes made him also believe) God Himself

had summoned them both could not but be listened to in heaven. Perhaps he owed his salvation more to her direct intercession than to anything else.

Another vision followed—a fanciful one this time, of the old Chieftain of Polp, the father of the young man who had come to him with such bloody purposes under his blushes.

Blenaria was still a medieval country in its clans, rough customs, and traditions. The Duke knew this terrible old chieftain of the mountains, only by report, as a giant in stature, with a patriarchal white beard, and more than eighty years of age, who had been married four times, and had for fifty years been accustomed to murder his enemies, when possible, with as little compunction as a starving man might kill a chicken—throttle them, when he could conveniently get them that way. As the Duke had told Shemstein the banker, it was a cherished old habit, this of the garrotte, like others in the wilds of Blenaria, good as well as bad; keeping a promise, for example. When a Blenarian said he would do a thing he did it, cost him what it might, if he could. They had virtues under their truculent exteriors, even the most ruthless of them. It was something, indeed much, to be, as it were, constitutionally unable to tell a lie.

This grim, indomitable old chieftain, this 'splendid old man,' as the Duke remembered styling him just now to his trifle of a son who, under his father's orders, had made such a desperate, old-fashioned attempt on the life of his king, was here in London! What an anachronism! His glaringly gorgeous native costume of scarlet, peacock-blue, and crude green, the

jacket studded with silver buttons (dozens of them, large and small), his cross-gartered shins (like columns, no doubt), his belt full of beautifully hilted daggers, and all the comic-opera rest of him, in the midst of the black coats, the engrossed, civilised faces, and the policemen of twentieth-century London!

And the others with him, who together had sent the Duke that truthful letter of the morning—bold medieval souls, eager to make any sacrifice for those old-fashioned fetishes popularly known as Liberty and Independence! The picturesque stupid! As if in these days any human being was, or could be, independent of his fellow-creatures, or free to do as he would—even a Tsar of Russia, the Chieftain of that little mountain patch Polp in Blenaria, or an aviator high in the air in the latest record-breaking air-machine!

But the last of his visions brought the Duke sharply to his feet.

On this crumbling old altar that terrible old man Apollonius Kragatz of Polp had sentenced to death not only himself, the king aspirant of Blenaria, but his own son! The stout-hearted monster! Whether this poor little Pedro Kragatz, his son, had succeeded or failed in his strangling, he was afterwards to poison himself as a sacrifice on that same altar!

The Duke produced the blue phial he had snatched from the strangler, and held it to the light.

He had arrested the tragedy thus far; but what might not be happening at that very moment in the Whitemonk Street rendezvous of these unscrupulous patriots, as they called themselves? Little question the poor boy Pedro had rejoined them, to tell of his failure, and—to suffer the consequences.

'By all the saints—no!' muttered the Duke, as he looked round, crimson-faced, for his coat. He saw the little fellow blessing him as King Ulric of Blenaria, and chancing it, with that wan, scaffold-smile.

Another moment or two and the Duke's arms were into his coat. He also would chance something, like Pedro Kragatz, who had shown that he came of a breed of heroes as well as stranglers. The boy should not die at the hands or bidding of his own father in that murder-hole of Whitemonk Street, or anywhere, if he, with or without higher aid, could prevent it.

But there was no time to waste. The thought of taking Von Enselsing into his confidence was abandoned as soon as weighed. It would mean lost time, to begin with.

The police? Well, perhaps. He would think about that when he was in the street. Two or three of the famous big London constables and their truncheons might, with himself, be quite a good match for the five Blenarian desperadoes, if these could be pounced upon unawares.

By good fortune the Duke's heavy travelling-

coat was in a wardrobe of his bedroom, with a light cap in its pocket. He slipped on both of them, and, furtive as a burglar, let himself into the corridor and moved away softly. Still more good fortune; the lift was at his service when he reached it!

'Be brisk, my lad!' he said, and presently he left the hotel without other restraint than the bows of a few servants with practised memories for faces.

One of the men followed him to make sure that his royal feet did not fatigue or dust themselves for an unnecessary inch; but he was waved aside.

'No, no; I will see to myself, I thank you,' said the Duke.

He kept to the pavement for a few yards, and then hurried to Whitemonk Street in a common taxi. The driver was not very certain about the street, but knew its locality, he said, if that would do.

'That will do very capitally,' the Duke told him. 'You put me down as near as you think you are to it. The corner of a principal street will be best, and then I shall ask. But make haste, you know.'

There would probably be a convenient policeman or two at such a corner as that. Meanwhile there would be time to settle definitely about taking these same policemen as companions for his farther progress toward that No. 19 house of perchance Doom!

The taxi made a very fair flitting of it. But the Duke's thoughts moved even faster than the car, and scarcely a furlong of the distance was covered when an inspiration that seemed to him quite brilliant told him what to do. He would meet Apollonius Kragatz without any police to support him, but as man to man, or rather one man to five, or as many more as there might be in that den of stranglers. And whether the old demon had or had not a murdered son in the room also to bear witness against him, he would tell him simply and straight what he thought of him and his pig-headed obstinacy in trying to live as if he were in the fifteenth or sixteenth century, not the twentieth. Perhaps his bloody-minded audience would not listen patiently while he talked. There would be bombs and pistols and strangling leathers in the room, no doubt, and the temptation to finish him off would be strong for them. But he would chance it—for Blenaria's sake. Though ignorant and misguided by the grossest of prejudices, a man like the Chieftain of Polp was, of course, the very pith and power of the tens of thousands of rude folk in Polp. So influential a barbarian was worth trying to win, even at the dagger's point.

The Duke had his exultant moments of transporting unreason, like other chivalrous souls, and these were some of them.

It would be a little complication for Europe,

and a sad blow for his beloved Adela, if he were really going to his death in this Whitemonk Street. The betting was not in his favour—he saw that. But he saw more plainly and seductively the high side of the enterprise, and resolved to go through with it.

There was also the sporting side. He had stalked and shot elephants under Kilimanjaro, and something of the same glorious breath-checking thrill was in his blood now as when he had stood gun to shoulder with nothing between him and four hundredweight of charging ivory and tons of angry flesh and bones, except just his nerve and an ounce or two of lead.

The May dusk was at hand when the car stopped, and, warm with enthusiasm, he alighted.

'Soho Street, sir,' announced the driver. 'Whitemonk Street's somewhere in Soho.'

'Yes, that's what I thought,' said the Duke. 'I shall give you a sovereign. Oh, wait a bit,' he exclaimed with a smile, and a hand raised against the man's thanksgivings; 'you have to do something else, you know, for all that money. It isn't much, though. Give me a moment'—

He spent several moments writing in his pocket-book. Then he tore out and folded the page, addressed it to Captain Von Euseling, and laid it on the seat of the car.

'You stay here for me one hour, my good fellow. If I don't come back by, let's say, eight o'clock, you take that small letter for me to the Ritz Hotel. That's all. And here's the—the quid, eh?'

He laughed and marched away, and the taximan appreciatively pouched the quid.

'No common foreign cove that, I'd lay a dollar!' observed the taximan, with but little risk to his banking account.

The Duke inquired his way twice, and was then in Whitemonk Street. He hummed a Strauss tune. An Italian organ at the door of an Italian *trattoria* welcomed him toward his ordeal with music.

Whitemonk Street was a frowsy lane of tallish red houses, mostly engaged as to their ground floors in public business—comestible-shops, cheap restaurants, &c. There was nothing at all sinister about these premises, and the only suggestions of violence offered to the Duke were their drifting smells of cooked food. But above the shops there might be anything. The upper windows on both sides seemed even darker than the time of day encouraged them to be; and on both sides, between the more cheerful shop windows, were occasional alleyways, needle-eyed, black as pitch, hinting that approach to certain of those upper chambers might easily be made both difficult and deadly.

Of course, of course. For all this the Duke was prepared. He knew something about the complex characters of the denizens of Soho. The London eyrie of these stranglers of Blenaria was

likely to be just such a quiet hell as this, with armed men and secret passwords between him and his quarry.

But, much to his surprise, it was not so with No. 19.

The door of the *blanchisseuse* tinkled a brassy bell and let him in. The *blanchisseuse's* name over the window, Marie Quigley, and the white sample shirts and collars of her handiwork in the window, were just as little provocative of emotions.

No one came to the counter until the Duke had tapped three times—the last time strenuously. Then a perfectly commonplace boy of fourteen or fifteen, with an upturned nose, sauntered in, and began to tell the Duke, with an Irish accent, that his mother was out and would not be back until—

'That does not matter at all,' interrupted the Duke. He whispered the word 'Kragatz.' 'You have some one here of that name?'

'Oh,' said the boy, 'and is it him ye want? Old Guy Fawkes! Ye'll be the doctor, I'm thinkin'. Just come this way, will ye? an' I'll show ye the stairs, sorr! The poor old bloke'—

'The—*what!*' exclaimed the Duke, pausing in the dark throat of the side staircase, with a glimmer of reddish light above, to which the lad led him. So a doctor was expected? That was strange indeed; and it would suit him well to get to his battlefield in that or any friendly guise. But the words 'poor old bloke' shocked him.

'Do you speak of Mr Kragatz like that? Do you mean him?' demanded the Duke with unconscious severity. 'Ah, well, it does not matter,' he whispered. 'But tell me, how many men are there with him?'

'Only him an' his son, sorr. Them others left about a quarter of an hour ago, after he had his turn. An' I didn't mean no harm callin' him that!' answered the boy.

'So!' The Duke's imagination worked fast. The chieftain had had a turn—of temper, no doubt—and he was alone with his son. Was the lad alive or dead? 'I go up. Which room is it?' he asked quietly.

'There's a holy image and a lamp over the door, sorr,' replied the boy. 'Ye can't miss seein' it.'

'I thank you,' said the Duke, who soon reached his destination. As the boy said, there was no missing that little plaster saint painted in blue and gold, and the hanging lamp of ruby glass before it. They were devout creatures in Blenaria, even the worst of them. The Duke did not recognise the image, which was presumably the patron saint of the strangling fraternity. He listened at the door, heard no sound within, knocked, and entered the room.

(Continued on page 267.)

CURIOUS EXHIBITIONS BY EX-CRIMINALS.

METHODS for fastening the arms and legs of prisoners to prevent them escaping or doing injury were in vogue in ancient Egypt, where hieroglyphic pictures on walls of ruins show men and women manacled with chains or lengths of flexible iron rods loosely fastened by the ends so that the bond could be adjusted in a circle and thus grip the arm or leg.

Various kinds of inventions for restraining criminals have been thought of by the inventor since the days of the Pharaohs; but the modern manacle is far different from the heavy metal clasps which pressed into the flesh and inflicted continual torture until death ensued from the pain, if the victim remained fettered long enough. To-day the police handcuff, the leg-iron, and other appliances for restraining a prisoner are so designed that they cause no pain, unless, in the effort to free himself, the man wrenches and pulls at his hands and legs in the struggle to break them.

There are ways, however, by which what seems to be a perfectly protecting handcuff may be removed and the wearer gain his liberty. These methods have been discovered by detectives in the larger cities of America as well as Europe, where prisoners have escaped although so fettered that it seemed impossible for them to loosen their shackles. Among the criminal fraternity in the United States some of those who apparently can remove the most clever device to hold them helpless are termed 'Neverstays,' meaning they always escape from confinement.

Some of these experts in throwing off their fetters have given up the criminal life to give entertainments in theatres, where they can show their skill. A description of some of their 'acts' will convey an idea of their wonderful dexterity in releasing themselves from bondage. Among the most interesting feats are those of the man who manages to escape in some manner from all sorts of regulation handcuffs, manacles, leg-irons, &c. Several of these are placed upon him; and then the performer retires into his small cabinet, and emerges in a few minutes entirely free from all restraint. The handcuffs are in every case genuine, and no confederates are employed. It is a very clever illusion.

There are several trick-handcuffs made for such exhibitions, and if the performer be allowed to use his own cuffs they may be of this kind. There are trick-cuffs of various sorts. Some of these simply pull open, and are never properly locked. In other makes the links of the connecting chain are weakened. Again, the lock itself has been tampered with, so that a blow on the hinge serves to release it. Many of them may be opened with a loop of catgut or shoestring inserted into the keyhole. This catches the lock and jerks it back. The style of cuff

known as the 'German transport chain' is never really unlocked; the hands merely slip the chain after certain manipulations of the hands and arms. Most padlocks are picked with one of the numerous skeleton keys with which the performer is sure to provide himself. French letter-locks are opened by finding the proper combination. This is largely a matter of touch, facilitated by placing a wire-spring between the arms of the catch to keep them pressed well back.

If the performer is not to be searched his task is comparatively easy. Keys may be concealed in his clothing, in various special pockets, or in the draperies of his cabinet. If, however, he is to be searched he must take precautions. Special keys are then concealed in a false boot-heel, in the mouth, in the hair, or in an artificial finger which is hollow. In any of these the article may be hidden. If the key is hidden in the hair this should be long and bushy, and the performer, after having had his hands examined, may say to the examining committee, 'Would you like to examine my hair also, and see that it conceals nothing?' As he says this he passes one of his hands through his hair with a careless motion, and thereby extracts the key, which he promptly conceals in one of his hands or elsewhere. As they have already seen the hand, they do not look at it again, and it is safe for him to hide the key in it. A key may also be concealed in the corner of a handkerchief, and in this case an opposite corner can be reached with the teeth. The key being reached in this manner, the performer employs it to open the cuffs as described.

There are many contrivances known as 'fakes,' which are used to open the locks of various handcuffs under conditions in which it would be found impossible, even if the performer were in possession of the key, to use it. One imitator of an escaped prisoner has introduced an ingenious 'fake' of this kind, with which the majority of English regulation cuffs can be opened. This new 'fake' is nothing more than a tiny steel tube, tapered, with a wire fitted through the centre. To open the irons the end is thrust into the lock, and the spiral lock-spring caught with the longest end of the tube, and then pulled outward. It is quite an easy matter to open cuffs and irons by this device. Of late a new regulation key has been adopted in England, having the thread on the outside instead of the inside. The 'fake' will be found to open almost any cuff having even this new improvement, the key being simply pushed home until it accommodates the thread of the particular cuff used.

It must be borne in mind that handcuffs are of various makes, but that every cuff of a certain make is the same, so that the same regulation key will open all of them. Consequently the

same means may be relied upon to open all of them. A new and ingenious 'fake' has recently been devised, by means of which the majority of regulation handcuffs and leg-irons, fitted with powerful springs, can be opened. A key is known as a 'master-key' when it will unlock two or more handcuffs, padlocks, or any other form of lock. Houdin, the noted magician, devised an ingenious master-key, with which he was enabled to open almost any regulation handcuff of the English make. It is composed of a regular key split on one side, so that it could be forced open more or less to accommodate the size of the thread in the lock presented. Three or four split keys of this variety, of different sizes, fastened together upon a common framework, would enable the performer to escape from almost any English regulation cuff presented to him. A specially long key, and a key having a left-handed thread, may also be included in the performer's outfit.

Considering the various makes of handcuffs and release therefrom, it may be well to describe first of all one known as the 'bean handcuff.' This is a cuff of American make, which when first patented was considered exceptionally safe. It is exceedingly difficult for the performer to reach the keyhole of these cuffs with the key when once they have been fastened upon him. Yet in presenting this trick the performer not only has no duplicate key, but even allows the keyholes to be sealed, thereby showing that no duplicate key of any kind is used. The release in this case is effected by means of a novel device. This is inserted into the lock, and, being pressed home, forces back the spring-catch. The catch being forced back, it can be slipped open almost instantaneously, and the release is effected. This is a trick that usually interests the audience, and one frequently done because of the effect presented in allowing the keyholes to be sealed.

This 'bean cuff' must not be confounded with the 'bean giant,' which in many respects is the

safest and most perfect handcuff ever devised. If this cuff be locked upon the wrists with the keyhole away from the fingers it is impossible to open it, even with the aid of the key. The performer generally produces a decided impression by locking the cuffs upon some member of the committee, giving him the key and asking him to unlock himself. It will be found impossible to do so. In order to open the cuffs a curious instrument must be employed. It consists of a long strip of metal, to the end of which a key similar to the original is fastened, though of finer make. When the performer enters his cabinet he gets possession of this metal strip, and holding the broad end of it between his teeth, he inserts the key into the lock, and by this means opens the handcuffs. If the cuffs are fastened with the keyhole away from the body they may be forced on to a key fastened in the woodwork of the stage, in the cabinet, or held in some secure position, and opened by being turned upon the key. Another important point is that these cuffs will not be properly locked until the two small knobs above and below the keyhole are pressed home.

A very ingenious and complicated cuff, known as the 'figure 8' or 'plug 8' handcuff, has also been invented. The cuffs having been closed upon the wrists, they are fastened by means of a small screw or plug which is firmly screwed into the lock. In order to open these cuffs it is necessary to unscrew the plug, then to insert the key, and turn first to the right, then to the left, similar to opening the lock on a bank vault, so many times until the catch is released. In order to escape from this handcuff it is necessary first of all to unscrew the plug. This may be done by means of a 'fake' held in the teeth, or by a more ingenious mechanism of a rather complicated nature which is inserted into the plug, and one of its wheels being held between the teeth, the other wheel is turned by means of the tongue, and this serves to unscrew the plug.

AT THE SIGN OF 'THE GRAY OWL'

By WILLIAM FREEMAN.

EMPHATICALLY a modern battlefield is neither a beautiful nor an inspiring sight—when the battle is over; and Private Jean Puichot realised as much as he staggered out of the trench over which the attacking masses had swept, walked a dozen aimless paces, and collapsed again.

A month before, the place had been a wheat-field, brown stubble under placid September skies. Since then it had been ploughed afresh. The gathering twilight hid much, but there was a horrible suggestiveness in every dark blotch that broke the horizon.

Puichot had been in the trenches for thirty-six hours, he and a couple of hundred others, watching the tide of battle ebb and flow. He had the vaguest ideas as to what had actually happened. He knew that he had loaded and fired his rifle almost as mechanically as the barking little Maxims worked, which the British had brought up on his left; that the enemy had been beaten back again and again, and had still come on; and then—

There followed a gap in his impressions, and he had come to his senses to find himself alone, under a darkening sky, with only dead men and

horses for company. He had no conception as to the whereabouts of his regiment. He did not even know if it still existed. In the distance the lights of a village twinkled; they looked homelike and friendly. He reeled to his feet again, and began a slouching trot toward them.

The distance was nearly a mile, and neither then nor at any time did he understand how he accomplished the journey. More than once it seemed to him that the lights could be no more than a will-o'-the-wisp of his own fevered brain; but presently he passed through a gate into a street, and felt cobbles beneath his feet. The lights suddenly confronted him, swooped upward in an enormous curve that reached the zenith, and were lost in black oblivion. In a word, he fainted for the second time.

He regained his senses on a stiff horsehair couch. Over him a girl was bending—a full-lipped, dark-eyed brunette.

'You are better?' she asked.

Puichot nodded. His mouth still tingled with the sting of the neat spirit she had given him.

'That is good. *Ma foi!* but you terrified me mightily when you fell into my doorway.'

With an effort he sat up, and realised that he was in a small parlour opening out of the public room of an inn. 'What place is this, m^amselle?'

'The village of Frontillac, m^sieu. This is "The Gray Owl," and I am the niece of Jules Dutil, to whom it belongs. I have done my poor best to keep the business alive since he went to the war, but it has been melancholy and profitless work.'

'You are French?' he asked. The fighting had been near enough to the frontier to make it uncertain.

'Belgian, m^sieu.' She spoke with sudden passion. 'If you or the English had come to our help sooner'—

'We did our best,' said Puichot mechanically. He passed his hand over his forehead. It was caked with clay and dried blood. 'If there is any place where one might wash'—

She pointed to the door that led to the scullery. There was a pump there, with its spout over a big stone sink, and a basin already filled. The ice-cold water cleared his brain. When he went back he found bread, cheese, and a bottle of wine on the table.

'Eat and drink,' said the girl brusquely. 'Then, if you wish, you may go in search of your regiment.'

Puichot, who was starving, sat down obediently. 'What has happened?' he asked.

The girl dropped into a chair opposite. Her vivid beauty smote his senses like a blow. 'What happened? Your men were outnumbered, overwhelmed, annihilated. The Uhlans—brute beasts that they are!—slew and slew.

They lost very many themselves. Perhaps for that reason they killed the wounded where they found them. I heard it from one of their men who passed through the village afterwards. If you should be found here'—

'I will go at once,' said Puichot. He was not thinking of himself, but of the probable consequences to the girl. He rose unsteadily to his feet.

Misunderstanding him, she smiled with contemptuous pity. 'You are fit for nothing but bed, m^sieu. There is a barn at the back which may serve.' She took up the lamp. 'Come!'

He followed her across a paved yard to an outhouse. She flung back the door for him to go in, and held the lamp high. The place was clean and dry, the straw a scented invitation to slumber.

'*B'n soir, m^sieu!*' she said, and left him to undress by the little light that filtered through the cobwebbed window.

He fell asleep almost instantly, to waken a couple of hours later with a raging thirst and fever. He stumbled giddily out into the moonlight. The door of the scullery was fastened on the inner side, and he was still fumbling with the handle when the window of a room above swung back.

The girl looked down. 'Are you dreaming of the Germans, m^sieu?'

'I am thirsty. I could not sleep.'

'Wait!' she commanded.

A bolt shot back, and she appeared, ghostlike, in a long white wrap, her hair lying in a thick plait over her shoulder. 'Of all the guests I ever entertained'—she grumbled. Then, after a glance at his face, 'Go back to your bed, and I will bring the water.'

She brought it. He drank gratefully, slept for a time, and awoke again in the clutch of semi-delirium to find her still near. She was there again when dawn broke; and Puichot, weak, but with the fever abated, made an effort to sit up.

'You are better,' she said, cutting short his thanks; 'but, Germans or no Germans, you cannot leave. Even an unprofitable customer must be catered for, and I have little else to do.'

So throughout that day and the next he remained. A strained tendon made walking difficult, but he saw enough of the village to realise that it was practically deserted.

On the third morning the girl came to him soon after daybreak. The rattle of distant rifle-fire had already aroused him. She carried a bundle of clothing.

'M^sieu, you will surrender your uniform, and at once.'

'Why?' he demanded.

'Old Lisette, who knits lace, tells me that the Uhlans have already been seen. These clothes belonged to my uncle. You must wear them, and take his place. You understand?'

Whether he understood or not made little difference, for she had gone away with his uniform before he could reply. Puichot put on the garments she had left, and followed her into the parlour.

She turned from her coffee-making to regard him critically. '*Bien!* they fit well! It is fortunate that you and my uncle are of much the same figure. Not,' she added impartially, 'that you have my uncle's intelligence.'

Puichot flushed dully. 'Ma'mselle has been an angel of mercy, all that a woman could be. But always there has been a—a hostility'—

'Hostility!' she flashed, with sudden passion. 'And why? Because we were told that your army, and the English, were to be the saviours of our country. My father and brother had a factory near Mons, m'sieu; and because they showed hospitality to a party of the Allies they were tortured and then shot. Your armies fell back—back—leaving our land devastated. Many explanations have been made; but a woman—a simple woman—judges from what she sees. Do you wonder that I have no love for your people?'

'I think,' said Puichot, half to himself, 'that you have never yet loved any one, ma'mselle.'

'It has never been worth while. My man would have to be *un beau sabre*, very tender, very brave, and a hundred other things! When I meet him I will perhaps give him my heart. Until then—Your coffee grows cold, m'sieu!'

It was their only approach to anything like intimacy. But the fact did not prevent Jean Puichot falling very swiftly and effectively in love with her. For a day or so longer they waited, always on the *qui vive* for the Uhlans; and then an afternoon came when the half-witted lacemaker fled past the door with the news that they were on their way from the next village. Already the distant hoof-beats could be heard.

'What are your plans?' asked the girl, as Puichot limped toward the front-door.

'Upon such occasions as this,' said Puichot seriously, 'one's nerves require a sedative. Père Bompard, three doors lower down, sells drugs, I believe?'

'Inquire for yourself,' said Lucille, and turned her back upon him, her eyes hot with contempt and anger.

He slipped away, but three minutes later was back again. 'The good Bompard was hiding in his cellar; consequently I was left to compound my own prescription.' His tone changed. 'As for you, ma'mselle, you will oblige me by retiring to the kitchen, and there proceeding to make your face dirty and your hair untidy—in effect, transforming yourself into the least attractive woman in northern France, if that be possible.'

'This is no time for compliments, even of

the clumsiest,' she flashed. Nevertheless, she went. And afterwards her obedience seemed to her the most remarkable thing of that remarkable day.

The Uhlans—a lieutenant and half-a-dozen men—approached. The lieutenant rapped with his sword-hilt against the door, and then, without waiting for an answer, flung himself into the room. Puichot, equipped with a large white apron, had taken his place behind the counter, and was polishing glasses.

'Here,' said the German, 'give us wine—the best you have.'

'I am sorry, Excellency; but there is so little left'—

'We've heard that tale before. If you're afraid to fetch the stuff, call your pig of a wife. I am thirsty.'

'We are poor folk. You will pay us?'

'Of a certainty. The Emperor will call in one of his Zeppelins with the money to-morrow! Quick, fool!'

Puichot, fumbling among the bottles behind him, uncorked and proffered one. The lieutenant filled a glass, swallowed a mouthful, and flung the remainder in his face.

'When will offal of your type understand that when a gentleman calls for wine he does not desire vinegar? What have you in the cellars?'

'Very little, Excellency,' said Puichot, spluttering.

'Go and fetch it. And we will follow. Those who fly down into cellars have a trick of disappearing altogether.—Sergeant!'

One of the men came forward.

'See first if this animal has weapons.'

'Up with your hands!' said the sergeant. He jerked Puichot's hands upward, and sent a row of glasses to the floor.

'He is unarmed, Excellency.'

'Good! Let him march.'

Puichot shuffled off in the direction of the scullery, where Lucille was clattering aimlessly among the saucepans.

'Wife!'

She started, and turned toward him with a crimsoned face.

'These gentlemen desire wine.'

'I—I will fetch some at once, messieurs,' she said, and went down the steps which led to the little whitewashed cellar. The officer turned to the sergeant again.

'Johan!'

'Herr lieutenant?'

'I am tired of shepherding these animals. They are slow-witted and slow-moving, and they may, after all, be deceiving us. Knock the one left behind here three times on the head for every minute which passes before his scarecrow of a wife returns.'

The sergeant, with a grin, dealt Puichot three blows which sent him staggering.

'Lucille!' Puichot's voice shook with pain and fear.

She appeared in the doorway, laden.

'Bring them back to the parlour,' commanded the lieutenant. He followed at the rear of the party, and watched while the girl uncorked the first bottle. 'This is better. And the scarecrow is less repulsive than I had imagined. Her grime hides something of her beauty.' He leered at her over the wine. 'Give me a kiss, scarecrow, and I will risk the dirt.'

'I—I would sooner give you another bottle of wine, m'sieu.'

'Except that of La Somna brand,' intervened Puichot, in an anxious whisper.

The lieutenant overheard, and set down his glass, scowling. 'What is that?'

'Nothing, Excellency; nothing!'

'Nothing? When you have a still better wine which you have not produced!'

'There are but six bottles, Excellency. It is of a vintage for the connoisseur's palate only.'

'That shall be proved. Let the girl go. No; she shall remain as a hostage. And you—the lieutenant drew his sabre—'would be wise to hasten.'

Puichot moved away. The eyes of the girl followed him. There was bewilderment, and shame, and contempt in their depths.

A moment later, and Puichot stumbled back into the room again, the bottles in his arms.

'Excellency, these are all I have. I would implore you'—

'Open them, dolt. And you'—he indicated the other men with a magniloquent wave of his hand—'may help yourselves.'

Puichot knocked off the neck of a bottle, received a blow for his clumsiness, and was ordered to bring and fill fresh glasses. He obeyed. The girl watched him secretly, but would not meet his eyes.

'*Himmel*,' said the lieutenant, drinking, 'but this is rousing stuff!' He smashed open a second bottle, and then a third.

'Excellency, I am ruined!' moaned Puichot.

'Swine such as you are lucky to escape slaughter. We will sing, and the pair of you shall dance to our singing. Listen.' He bellowed the chorus of a taproom song. 'Sing, wench, sing, or'—The lieutenant staggered toward the girl, gripping his sabre.

She gave a choked cry of terror, and shrank back. Puichot stood motionless until the man was a couple of feet away, watching him with keen, critical eyes. Then he dealt a sudden, swinging blow which caught the protruding chin fairly. The lieutenant went down with a crash which set the glasses jangling, and lay still.

The sergeant made a movement to rise, but dropped back heavily in his seat. None of the other men stirred; their breathing had become heavy, their eyes dull and fishlike. One by one they slid forward in ungainly heaps.

The girl stood as though frozen.

'What—what does it mean?'

'The wine was drugged,' said Puichot. 'I got the stuff—it's laudanum chiefly—from Père Bompard's.'

'Will they—will they die?'

He shook his head. 'I am no poisoner, ma'mselle. They should come to their fuddled senses in a few hours. Before then—he eyed her with a faint smile—one could travel some considerable distance, especially if one had a vehicle.'

She understood. 'I will harness the mare at once, m'sieu. And later, when I am able, I will try to thank you.'

Dusk fell, and found the two of them plodding along a road that stretched, an interminable gray ribbon, between a succession of wind-swept poplars and over many hills. They had taken what Puichot conceived to be the direction of the Allies' lines; but their chief anxiety was to avoid any chance patrol of Uhlans. Once they took refuge in a spinney, hearing hoof-beats that soon died away; and later they were compelled to make a long detour because of a swollen stream, a sinister freshet in which the bodies of men and beasts floated darkly.

Night had enwrapped them when a sudden '*Halte!*' broke the silence. Puichot climbed down from the cart, but in a moment returned.

'Be thankful, ma'mselle. It is a French outpost. They will care for us both until to-morrow.'

'And afterwards our roads will lie apart.'

'Must they?' he asked in an unsteady voice.

'We—we have known one another so short a time, m'sieu.'

'A lifetime, an eternity, ma'mselle! You are Belgian; I am French. Everything in the world may divide us; but I love you. If I go back to the wars and fight—I, who am no *beau sabre*, but whose very soul is yours—will you wait for me?'

'Yes,' she whispered, and with brimming eyes lifted her lips to his.

THE MESSENGER.

TO-DAY I found, beneath an old yew-tree,
The first pure snowdrop of awakening spring,
That bridged the gulf of all that is to be,
And gave true joy to every gladsome thing
That love sets free.

My inmost soul shook off the dust of care,
And anxious hours were girded with a song,
When I beheld this drooping snowdrop fair
Lift its sweet head above a world's sad wrong,
As if in prayer.

Oh hope divine that makes our bliss complete!
Oh humble flower with raiment white as snow!
Near thy pure breast God and His children meet;
Thou art of heaven. Oh, teach our hearts to know
Thy message sweet!

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, Yesterday.

ONE night near the beginning of the year there was a gathering in London of men who are dreamers and workers in writing and painting, people engaged in the practice of arts and sciences. It was really an occasional festival of the winter season, when these authors and artists and their friends met with the object of dining and spending some hours in such a good Bohemian way as becomes rare in modern London. Invariably a happy gathering is this, and unique in a peculiar intellectual and social interest. It is hardly less attractive in time of war than in the days of peace; but, as one may imagine, a change has come over the spirit of this assembly. It meets now at half-past six in the evening instead of seven, and by eleven o'clock it is completely dissolved, each unit having meditatively departed through the gloom of London, utter blackness, to his fixed abode. Those who were full of humour are invariably serious; on their countenance is a fixed continual solemnity. They do not laugh or shout. The war has shaken and changed the natures of peculiar people such as these when perhaps nothing else could have done so. The man sitting opposite to me at the dinner-table was a distinguished novelist, who said that all efforts to write even an odd line of a story since the war began had failed for lack of power to concentrate. Yet another writer of good fiction smiled, declaring that, being debarred from assisting in the war, he had retreated to the most lonely and isolated spot he could find in south-west England, and there, in the meanest cottage, and with a dog for sole companion, he worked at some creations which may bring him more fame when the war is over. And he works better and more than ever before because of his settlement of mind, for the nearest town is some miles away, he has no letters or newspapers delivered to him, and only once a week does he make a timid, hesitating excursion in search of intelligence, at the same time performing a little national service as the complement of labour for his personal advantage. An actor of some eminence sat at his meal in the uniform of the Lancers; an *impresario* was in khaki, and about to travel north to act as interpreter at a camp of German prisoners; a distinguished newspaper editor revealed some

secrets of the extent to which the order of strength of the great daily journals had been changed by the war (and the upheavals in Fleet Street have been very remarkable); and a man who writes some books and has had the reputation, not without cause, of exhibiting the most advanced Socialistic tendencies—to such an extent, indeed, that it has been pleasantly averred that in the past he has with little effort been able to see a special beauty in crime!—related with pride the existing circumstances of his nocturnal beat as a special constable in the grounds of Buckingham Palace. A young American to whom this community had given hospitality for some preceding weeks, and who was now about to return to his native land, outlined the nature of a campaign that he would enter upon as soon as he was liberated from the *Lusitania* in New York. He had a clear view of the magnificent, the glorious cause of the Allies, and there was a small section of his countrymen to whom, whenever possible, he proposed to expound some plain truths in the plainest possible way. There was in my mind, however, at the beginning of these notes a small point of a different kind to illustrate this general change of moods and ways. These people have few formalities and several peculiarities. Having eaten, they like to make a plunge headlong into some musical pleasure of an intensely spiritfult sort; something with hot blood and smiles in it, a happy song to be sung by a man himself at the piano, in which love and life may have a part for happy praise—a song of the living world. On this night the man left his seat at the table and went to the piano in the usual way. He sat at the instrument silent for several moments, as if in meditation, and then, with his eyes on the ceiling, he struck heavily for the first notes. He did not sing at all, and what he played was very unusual, yet no one was surprised, and all listened with sympathy and satisfaction. His playing was excellent; he came near to fine inspiration. And what, then, did he play? Just that grand 'Funeral March' of Mendelssohn, with all its thunders of eternity and its whispers of the soul. As a little affair in war-time psychology it seemed odd enough.

I have mentioned before how little the surface of things has been disturbed in the capital; how, for all the sore and heavy feelings, and even the nervous dreads, life goes on in much the old steady way. The tremendous momentum of this vast human machine is not to be disturbed even by such a thing as a European war which threatened to change the world. If London were deflected from its normal course we might begin to be anxious for the safety of the Empire, for the one is symbolical of the other. What wars of the world have ever moved London from its own regularity, that essential steadiness of its life and work which has nothing to do with such details as the hours of closing of clubs and restaurants? And would it not be a sorry thing if a place with the history and traditions and the fine solidity of London were now to move a yard from its normal path because a nation somewhere on the continent of Europe has got a drunkard's madness and is seeing things strangely? Because that would be so, one feels a little the more regretful for even those surface departures from the normal like the darkening of the streets in the evening. The lake in St James's Park has been empty all the winter. The hard, gray cemented floor which has been exposed has made it seem like a withered lake, and those who have crossed the bridge on moonlight nights have missed the enchantment of what I regard as the most beautiful scene in London. Viewed across the water to the east, there are heavy clusters of trees in the middle distance, and in the background, shining white below the moonbeams, a mass of architecture pointed with spires, and, as it seems, with cupolas and minarets surmounting walls of traced stone. It makes us feel as we look that this is India of the East, and not Britain of the cold, lone island in the North. Some have said that the lake is empty now because the embellishment and decoration of London matter less at present than they do at other times, and it is good for the place to be dry for a season. Others declare that reflections on the water would make a guide to hostile aeroplanes; but we weary of such tales of nearly trembling care, and would have no more of them. On the floor of this lake, from one end to the other, two big pipes—each of which may be a foot in diameter perhaps—are laid, and here again the people who in London are apt to wonder much, and rarely to inquire, have conjectured that it may contain a trifle in the way of water-supply, or be concerned in some matter of drainage. But the truth is that there is here shut up and cased away from all the light of day what little remains of one of those burns that trickled down the hills of early Lyn-Din. You may change the course of a river or a rill, but in default of the removal of the hills which gave it birth it is a hard thing to suppress; and here still flows through the darkness of the pipes an old brook of Lyn-Din which our civilisation has made

prisoner. It is a happy thing at present to let fancy wander off to those days of the simplest Britain budding to its life, remembering that never all the time from then to now has London been the victim of the savagery of any foreign foe.

* * *

However all this may be, a city such as London, which surely has something in its ancient bones and stones that is closely akin to life itself, is not to be transformed, not even to be seriously disturbed, by a few months of the greatest war. What momentum it has gathered through the ages carries it now serenely on. The settled habit, the regular system, of London is a remarkable thing. We speak often of what we call the 'law of averages.' Have you reflected that London, and other cities and communities in a lesser degree, owe the smoothness of their existence—almost even the very continuance of their existence—to the even, steady working of that law of averages which is nearly as sure and regular as the sun and stars? If for one single day the law of averages were suspended London would be thrown into a state of chaos. Its system would collapse, its convenience vanish. Trading would become impossible; the people would fall to panic. All the grand dignity of London which has grown and ripened through the centuries would fade in an afternoon, and the city would be in a sadder state than if the hordes of Prussia were let loose in it for devastation. Consider the case. At certain times and in equal circumstances there are approximately an equal number of people at one place, and doing the same thing. Each thoroughfare presents much the same appearance 'as usual,' this very term being a recognition of the exact working of the law of averages. In Piccadilly, in the Strand, in Regent Street and Oxford Street, in Cheapside and in Lombard Street, it is always 'much the same;' if wet a trifle less in human density, if very fine a trifle more. The appearance does not change, and so the number does not vary much. If one day there were only half the usual number of people in Lombard Street, or Piccadilly had twice its quantity, one would notice it, be surprised and wonder, and no doubt be uneasy as in the presence of a mysterious phenomenon. Clearly something would have gone awry, and the public arrangements for vehicular traffic would not be agreeable to this odd state of things. Day by day a steady average is maintained. So with the passengers on the metropolitan trains; so with the people in the restaurants, the tea-houses, the theatres, the hotels, the large rooms in the clubs, and everywhere. There are thousands of tea-shops in London depending chiefly on a vagrant custom, and yet at the same time of each day there is nearly the same number of people in each of them. The official statisticians

can prophesy to you with a rare exactness how many people will walk past a particular point in the thoroughfares on any day you like to name, or they will tell you how many vehicles will pass through a great crossing, and so forth. The omnibus and railway companies make all arrangements for the services with a knowledge of approximately the numbers who will wish to travel. There is a simple expression of confidence in the same working of this law of averages in the old fable that in the traffic moving over London Bridge there is always a white horse to be seen; but as horses are scarcer now than when this suggestion was first made, we are disposed to substitute a yellow motor-car for the conspicuous animal. All this movement, this arranging and massing and working of people, is so regular, so certain, and so matter of fact that we do not marvel at it, as we do not wonder at the rising of the sun or the remarkable achievement of nature in the loosening of a shower upon the earth. Yet here is, to my mind, the greatest of all the wonders and mysteries of London; for have you reflected that all the regular and convenient peopling of the streets, the theatres, the restaurants, the public places, is, so far as human volition is concerned, a matter of pure chance, only sometimes very faintly regulated by previous knowledge and experience? Surely more than half the number—might we not say nine-tenths, indeed?—of the men and women in the Strand at any chosen moment of the day are there at that time largely, if not entirely, as a matter of chance. Most of them were not there the previous day at that time, or on the one that followed. In a haphazard way they arranged to be there at the time selected, or were led involuntarily to be there, and not all at one place, but walking in an even distribution along the thoroughfare. So with the hotels, the restaurants, and the tea-houses, they are filled by the people of chance, who go there on a day as if by an accident or in the way of some special expedition; but yet so evenly, so certainly does this chance work that it has all the appearance of a regular system. So with the white horse that pulled its load over London Bridge, and the yellow motor-car that in its stead is now impatient in the complex traffic. Nearly every day the horse was different, and no arrangement was made among the owners of white horses to keep the Bridge supplied; and yet when children were told that there was always one to be seen that way, and were seldom disappointed. This circumstance would then be pointed out for illustration of the immensity of London, and not for the strange chance and the wonderful working of the law of averages. What if this mysterious working, which is none of our human arranging, were suspended; if you and I and all of us who had determined we would walk up Regent Street to-morrow or the next day should go this afternoon instead, no reason

existing why we should not? There would be a hopeless, almost impassable crowd this afternoon, and to-morrow the street would present an appearance of desertion it never has done on a working-day for ages past. In the same way there might be at other places crowds that almost crush to a state of panic, and deserted halls. To her consternation, two hundred friends might swoop down one afternoon on Lady C. when at most she had hoped for ten. How happy and satisfied is she made by the restraining power of the law of averages! And yet it is not a law, as we think of laws, but simple chance. But if this mysterious chance did not work with such regularity, would not the whole of our social arrangement, this grand and finely ordered structure, fall loose and collapse, so that all would be confusion and chaos, and work and pleasure become equally impossible? Surely that would be so; and then, the regularity of chance having failed, we people would be obliged to set up a definitely ordered human arrangement and system, or the convenience of our life would perish. We should need to take tickets in advance to walk down Cheapside at a certain hour, and only a limited number would be issued. So with the omnibuses; so with the railways underground, the restaurants, and all the rest; and the *salon* of Lady C. would no longer be free to the intellectuals of her acquaintance. Existence in London by such rule would be intolerable; we should pack and proceed to Paris or the country, and leave it to its tickets and its precious man-made system. So all depends on chance, or the law of averages, a vague term which tallies better with our respect for order and reason. And this law of averages, then, this process to which is given a name as if to suggest that it is nearly as exactly defined and regular as a matter of mathematics, a prosaic thing for the reckoning and use of man, is after all mere chance! Then London moves and lives by chance, such a chance as might exist in the fluttering of a bit of paper in the breeze?

* * *

It could not be; the wonder of all results and happenings gives denial to such a fancy. This law of averages working so inexplicably, so mysteriously, must be above all mathematics. Surely it must be regulated by an unseen, unknown controlling force. Its achievement is not erratic, as mere hazard would make it; its precision is that of nature. Much of nature, except the beginnings and the grand supernatural force, we of the world can explain with some satisfaction to ourselves; but this law of averages, on which we so much depend, we cannot explain. Must we not then agree that the expression, used so frequently in a vague and careless way, is really one of the grand supernatural mysteries by which order and convenience are given to some of the workings of man, but with the

appearance of chance and spontaneity, so that the unknown and the future shall have their abiding attraction, and the notes of destiny and fatalism shall not be emphasised, so that the freedom of life may not be crippled? '*Le hasard est un sobriquet de la Providence*,' a French author wrote, and that is true. And at the end of such reflections one returns to the original thought that even the full shock of this tremendous war has not been able in the least to disturb the working of the law of averages in London and the other great cities of our isles. It, with the business, operates 'as usual.'

* * *

An epilogue may be added. One night I walked along a street that led away from Leicester Square, and in a by-street on the left I saw a crowd of people, some soldiers among them, gathering in the darkness. They exhibited some excitement, a certain anticipation perhaps. A fire had broken out in one of the upper rooms of some very mean-looking premises, and a faint

glare could be seen through the window-panes. Instantly there was heard the jangling of bells, the clatter of the hoofs of horses at the full gallop, and the rattle of approaching wheels along the adjoining streets. The fire-engines! One, two, three, four—several of them! Brass-helmeted firemen began to work with a speed that would be frenzy were it not for the trained method of it all. Escapes were laid to windows, streams of water were spouted up, a faint cloud of steam was seen, and then in a minute all was still and dark again, and the crowd moved on. The effort was, as usual, splendid and successful, but the cause of it was nearly nothing—just a flare among some papers and old clothes in a cheap and dirty room. But here was civilisation in its constant effort to preserve; all its grand machinery for the safeguarding of even the poorest things in one dark spot. And there was Europe all ablaze in mad destruction of the best and costliest of its work for centuries, with many thousands of brave men given continually to the slaughter. What pathos in such incongruity!

THE BRIGHT EYES OF DANGER.

CHAPTER XVIII.—CLAYMORE!

NEXT morning it seemed as if I had just laid my head on the pillow when I was awakened. I could have composed myself for other six hours; but the house was stirring, feet scuffled along the passages, and from the courtyard came a great clatter and shouting, trampling hoofs, and a confused clamour of voices and movement. I lay half-awake, cursing the din, vastly unwilling to lose precious hours of rest; but sleep, I soon discovered, was out of the question. All the cocks in Edinburgh seemed to have roosted in the neighbourhood; the morning air vibrated with their raucous challenges, a thing not to be endured. I flung out of bed and hurried into my clothes, temper strangling the last of my yawns. A babel of sounds floated up from the streets: fishwives from Newhaven hawking their wares; Gilmerton carters bawling 'Saun'—yellow saun'; water-carriers with their barrels; caddies on the trot; gossiping burgesses standing in groups. Strange and ominous accompaniment to these trivial workaday sounds were the hoarse commands in the Gaelic, the ring of hoofs, the measured tramp of Highlanders patrolling or changing guard, the neighing of the pipes a continual undernote in the mêlée of sounds; and at intervals, clear above it all, came the lively réveille of the English bugles at the Castle.

From my window I could see a crowd of uncouth-looking Highlanders, travel-stained and unkempt. The troopers' jack-boots were muddy to their tops, and the dress of the rank and file

(a bright red tartan) in an extremity of disorder and shabbiness. They were the Grants of Glenmoriston, who had arrived, after a forced march, from Inverness way to join the Prince. Glenmoriston himself was at Duddingston, and his men were here, I gathered, getting horses shod and on the hunt for weapons. I heard afterwards that they seized a stand of Lochaber axes of the town guard, and broke into a smith's shop, where, finding nothing, they took revenge by smashing the signboard, tearing the rafters off, and stripping the shop bare of everything except the anvil and bellows. The rascals tramped in and out of the 'White Horse' gesticulating, shouting in Gaelic, making a chaos of barbaric sounds, demanding meat and drink, though it was plain (even at that early hour of the morning) that most of them had been at the bowl already.

'The Chevalier will be on the move frae Duddingston sune,' said the landlord, 'and thae blagiyards wi' him. 'Tis glad I'll be to see their backs;' and fell a-cursing (but under his breath) all Jacobites, tartans, claymores, and everything—man, woman, and child—beyond the Highland line, with a vigour and language past belief for a man of such outward docility.

'Is there news, then, of Sir John Cope?' I asked him when he stopped through sheer want of breath.

'God be thankit! they tell me that he is on the march frae Haddington, and there will be an end o' this damned clamjamfry in twenty-four hours.'

I was not so sure of this, for the Highlanders, with all their strange equipment, their ignorance and predatory instincts, were courageous fanatics, with strong, unleashed emotions under their ragged plaids. An ideal, the strange and masterful world-force, elusive, reason-defying, that has done so much in the long march of history to upset accepted canons of government and precedent, had touched their wild hearts.

My little rift with Walter Irving was not to my liking, and I purposed making peace with him; but when I sought him he was not to be found, and the landlord knew nothing of his movements beyond that he came and went as he liked, and at all hours.

'A body gets little pleasure in servin' the likes o' him,' quoth the landlord. 'Siller is no' everything that a host seeks, sir. I like to see my guests in comfort at their meat; but gin Maister Irving's kale be ready for him, I've uphaid I'll no' see him till supper, an' whiles no' even then. Forbye, the guidwife girns, an' I get the wyte o't. As for sleep, the man might be a hoolit. He was up an' awa' at the dawin'. Gude kens when we'll see him. No' that it's my concern; and so on. The good man would have discoursed until noon; but I gave him good-morning, and sauntered up through the Netherbow Port, past the guard, and along the High Street.

Presently a little man in a scratch wig turned as he was passing me, and addressed me by name. I knew his face. He was Mr Peter Scott's clerk, and was charged with the delivery of a letter to me. The kernel of it was that the writer had the pleasure to inform me that he had made inquiries, and that the house of The Garth belonged to a worthy man in Fife named Gilland, and that Mr Gilland's 'doer' (a personal friend of Mr Scott) had informed him that the house was let to a gentleman of France, a Monsieur De Boux, who had some feeling and sentiment for Scotland through family ties. The writer assured me that my instructions would be looked for by him anxiously. I told the clerk that there was no answer, and pocketed the letter.

Here was another knot in the skein of the affair! Foudelle de Boux was a name mentioned in the secret paper! But I had knitted my brows long enough, and was in no mood for more speculation over the adventure. I tried to banish it and Mr Scott's letter with indifferent success, for my thoughts came back like homing birds, circling round the vision of a pale, proud face as I had last seen it in the tossing glare of the torches when Mistress Charlotte rode down the High Street on her chestnut. I sauntered on aimlessly enough, in a half-reverie, my preoccupation earning me a jostle or two from the foot-passengers, until the sight of some sedan-chairs suddenly awakened my interest. They moved sedately along, and as each one approached I contrived a nervous glance inside. At last, in one of them I caught sight of a tartan

screen. My pulses quickened. I followed it, to see it stop at a close, and a stout and elderly dowager, of plain, not to say forbidding, countenance, hoist herself out and rate the chairmen soundly in a shrill indictment. I cannot tell how this trifling thing vexed me. Its ludicrousness seemed to point the folly of my conduct. My annoyance was out of all scale to the cause, putting me in the dullest of humours, so entirely out of countenance that I railed at myself for a nincompoop to be trailing the streets of Edinburgh on a chance of seeing a pair of hazel eyes, when all around me were men of action and the atmosphere and imminence of battle. Yet I loitered so long that it would have been little wonder if some of the Highland patrols had suspected my movements and clapped me into the guardhouse.

The stream of the crowd was flowing steadily in one direction, towards the road by Easter Duddingston, where the Chevalier's army was soon to pass on its way to meet Sir John Cope. Here, surely, was better employment for me than moping about the streets. I should see something of the fight, and lay the ghost of The Garth affair for at least a day or two. Going back to the 'White Horse,' I saw that the mare had a good feed, ordered the stableboy to saddle and bridle her, and while this was being done I swallowed a hasty breakfast, thrust some oaten cakes, a lump of cheese, and my spyglass into my pocket, and rode off in the clear gray-green of the September morning.

I had no settled plans except to see a battle. There were crowds of countryfolk as well as the townsmen in the streets, anxiety on their faces, and certainly with no signs of enthusiasm for the Chevalier. Nor did I see anything approaching enthusiasm in Edinburgh. The town yielded, with an ill-concealed half-heartedness, to the inevitable.

As I neared the open country the sun rose steadily over the picture of the Lothian, fair and peaceful as one could wish to see. Looking at it, man's ambitions and his mirage of life, rightly considered, seemed to me strangely poor and unsatisfying. There was something almost wistful in the peace of the countryside; but, even as the thought touched me, there came on the wind a deep note, a sudden rousing surge in the silence. It was unmistakable, multitudinous, the great voice of an army; and there, about two Scots miles away, was the head of the moving column, the morning sun sparkling on their steel. I rode along a sloping path into a clump of trees on a hillock above the post-road, and there dismounted to watch the advance. The Highland army was soon abreast of me; and, though I am an English Royalist, I own that my blood tingled. War, some pundits tell us, is a reasonless sin, a survival of savagery—that the day of ploughshares and pruning-hooks is at hand, when men shall be content to buy and sell

and sell and buy until the grave claims them. It may be so. I doubt it; for man, not having the will to cease war, has not the power. Nor will he have in England until the love of freedom, vision, man's spirituality, and the noble passion of patriotism—mother of splendid dreams—are dead.

The leading pipes and drums shrilled and droned and rose and fell in 'The Battle of Harlaw,' the wild tune of it the very translation of the ecstasy of battle.

The rebels marched three abreast, a strange and memorable pageant of colour and rags. I was near enough to see their unkempt hair and beards, and their bare muscular legs swinging along to the quickstep of the pipes. Presently I saw an officer point in my direction, and turn to another who rode beside him. This one, pistol in hand, rode across the stubble toward me. I made no concealment, nor did I see the necessity for it. He came within a few paces, and began, 'I have it in charge'—when he stopped abruptly. 'It is you!'

I knew him at once. He was Patrick Maxwell, my opponent at *écarté* in the 'White Horse.'

'It is,' I said, and gave him my greetings.

'I am on my duty, Mr Layton. Ye will understand. My Lord Pitligo's men saw ye; and I am charged to report. Ye are alone?'

'Alone, and rode out of Edinburgh to please myself, and see, if I could, some of the doings eastward. I am no spy, if that is in your mind.'

He stared hard at me. 'D'ye ken o' any?' he asked abruptly.

'I know nobody under arms, other than the gentlemen who were watching us at cards the other evening.'

'Who is—I forget his name—the man with the Liddesdale blue bonnet?'

'A chance acquaintance, an honest enough fellow; but my memory runs that it was he who introduced me to your friends and yourself,' I made answer.

'Maybe it was as ye say. We met him over some claret, I think. But it is of no consequence. I merely asked you in my duty.'

'It will save time, Captain Maxwell, if I tell you that neither he nor I have any concern with the Rising, for or against. By Heaven! if I were for the fighting line is it likely I should be standing here?'

He smiled. 'Frankly, I do not think, Mr Layton, that it is. Ye give me your word of honour as a gentleman that ye are in neither service, art or part, in secret or otherwise.'

'I do.' I held out my hand, and he took it without hesitation.

'I believe you, Mr Layton, and I'll report the same to my superiors.'

He saluted, and rode off for a few yards,

when he suddenly turned his horse and halted, looking at me with a frank and kindly eye.

'Come, Mr Layton! ye are well mounted. Ye see the flower of fighting Scotland there,' pointing to the column. 'I have no commission to recruit; but—but, man, I'm fain to have ye wi' us. To-morrow will see the most of Johnnie Cope's men in beds that will be none too wide for them, and the Lowlands (I speak as a Lowlander myself, mind ye) will be "out" for Prince Charlie. They are quiet at the moment; but ye may have seen a brown moor quietly asleep in the sun, but with a spark at the deep heart o't that nobody kens o', a spark that smoulders and smoulders, until the wind comes, and the moor blazes red to the sky! So it was with the Highlands, and so it will be with the Lowlands! What say ye? I make no doubt that your family and condition will readily ensure ye a commission from his Highness.'

I could but shake my head.

'Is this your last word?' the Jacobite asked, disappointment in his voice.

I told him firmly that it was.

'Well, ye ken your own mind, I'll say that for ye. But, man, 'tis in my heart to see ye mount the White Cockade!'

He turned in the saddle as he rode off and held up a hand. 'See! I do not wear the ring yet. This may be the last time I'll break speech wi' ye. God knows! I may come back feet first if I come at all. But remember this! Pick your feet, as the saying goes, in the town o' Edinburgh. Choose well your company!'

Before I could ask him what he meant he was off at a canter through the stubble, and I soon lost sight of him among the long line of the advance. I watched the Highlanders from the front rank to the sumpter-horses at the rear, and then I followed about a mile behind. When they came near the town of Musselburgh they broke off, taking a road to the south. This I learned was in case General Cope should forestall them in occupying some high ground. At the inn at Musselburgh—Luckie Chrystal's—I had a tankard, and learned that the English army was still near Preston. It was plain that the armies would soon be at each others' throats; so, leaving my horse at the inn, I struck out on foot into a waste of sandy and bent-covered hillocks that stretched northward toward the sea, where, I judged, I might pick out a spot to command the arena with my spyglass.

It was now almost half-past ten, and the sun was shining brightly. A few countryfolks were about. One of them told me that Cope's pickets were up and down the links, and pointed out to me from a brae-top the village of Tranent in the distance to the south, Preston, with a windmill, and Cockenzie farther along the coast. In half-an-hour I came to the shore, a dolorous-looking stretch of sand with a ragged fringe of scattered seaweed, the sea making a hollow

rumble along it, and the king's ships riding far out in the Firth. My spyglass showed me in the distance a group of soldiers near a sand-dune with a sentry posted on it. They were a couple of miles away; and, but for their little black cluster, the curve of the coast showed no life except the cormorants fishing or the gulls mewing overhead, reeling on heavy wing into the wind.

I had no desire to run against any of the English pickets. It was probable that they would keep me a prisoner until after the fight, and in that paltry situation I should see little of the action; so I sat me down in a hollow among the hillocks, and waited, with what patience I could, for developments until about noon. Then, crawling through the bents to the top of the ridge, I peered over it, and saw plainly the chess-board of the field; Sir John Cope's men on a plain rising gently inland—a well-chosen position; Preston village on his right, and a morass between him and the Highlanders. The two armies moved and counter-moved without a shot. I saw a small company of the king's troops move out, and laying my spyglass on the morass, picked out a solitary rider from the rebel lines mounted on a white pony. The intrepid figure, riding as coolly along the morass as though on parade, kindled my admiration. Shots rang out, but he was not touched; and,

dismounting, he deliberately pulled down a part of a stone dike, and led the pony through the gap. When he had surveyed the spot he rode back at a canter. Soon after the Chevalier shifted his ground, and the king's troops faced round. The afternoon wore on, tediously enough, if one can so talk of the hours before a battle.

Once a couple of gallopers were fired at, a Highland outpost near a church forcing them to retire on the main body; but beyond this I recall nothing of excitement except when a picket passed within a few yards of me, and I had to clap down in the bents like a rabbit to avoid being seen.

The evening fell chilly. It was lucky that I had my greatcoat, for a raw mist floated in from the sea, and without the coat my teeth would have been chattering. In front of the English army a line of great fires had been kindled. I would have given much to be beside their ruddy warmth; but I had to make the best of my quarters, so I made a little lair in the bents, and, curling myself up in my greatcoat, lay down as far out of the wind as I could, and waited patiently for the sound of the firelocks. I should have been better in my bed, no doubt; but I was young, and did not know that in this life battles come to every man without his seeking.

THE TRUE ATMOSPHERE OF WAR.

WAR IMPRESSIONS OF AN AMERICAN GIRL IN FRANCE.

By EDNA ELLIOTT-CARR.

HOW long will it be, I wonder, before England, or even her wonderful city of London, fully realises the true atmosphere of war, the atmosphere of mourning, of sorrow, and of pain, which is approaching every heart of us under the shadow of the big gray cloud? At the moment London appears outwardly bright and unruffled, with its brave smile of light-heartedness and patriotism. One meets it everywhere—in the glittering restaurants, in theatres and music halls, in busy stores, bearing out the maxim, 'Business as Usual,' and, indeed, in the ordinary round of everyday life. So it was when I left for France a month or so ago; and, on my return, behold! the same atmosphere, not one whit less cheerful and sanguine. The truth is heard and believed, but scarcely yet realised to its full. No; we must visit France or Belgium, the countries of our Allies, to realise its actuality.

On reaching Paris, after a surprisingly calm and uninterrupted journey from London, I was immediately confronted with a hundred and one happenings which compelled me to realise the war. The beautiful French capital, so subdued and

depressed, difficult to picture, with its world-wide repute of incessant gaiety and irresponsibility! But so I found it. Its streets and boulevards well-nigh deserted, and its many closely shuttered shops bearing the now familiar bill stating that the chief and staff have gone out to fight. Even the café-life a breath of the past, and the night-life shut down; for 8, 8.30, or 9 p.m. marked the closing hours of cafés and restaurants; theatres and amusement houses being in complete darkness, with doors barred.

However, the city is now beginning to find itself once more, for day by day it is nearing its noise and gaiety. The shops are opening, some of the places of amusement also, and the citizens are very optimistic over affairs in general. Before I left, the boulevards were beginning to be crowded each day with the *chic* and fashionable, who had returned to their residences in the gay city. A number of the chief hotels are closed, but many have been transformed into luxurious hospitals, and are alive and busy with the tending of the sick and wounded entering them daily.

Sundays in the Madeleine. The sombre and

heavy mourning of the Frenchwomen suggests the effect of little black clouds amongst the congregation. Special prayers and sermons, each a petition for the heroes fighting for their country and those they love. Now and then a slight interruption, when a wounded man makes his way amongst us, with the aid of a nurse or comrade. Such a scene must fill our inmost hearts with deep emotion!

Outside, in the streets, there are constant glimpses of the now familiar khaki, in motors whizzing by, to and from the front; in groups on the boulevards, amidst a small company of admiring French; or in twos and threes, emerging from little side-streets, having lost their bearings, with small boys proudly accompanying and guiding them, and an amusing struggle for the language on both sides.

One of the saddest sights is the early morning funeral to be met almost daily in the streets of Paris—the lonely journey of a dead hero from his bed of suffering to the Garden of Sleep. One sunny morning, as I turned from the wide Champs Élysées into a side-street, I found waiting near the back entrance of a large hotel-hospital a small company of gendarmes with bowed heads, their banner bearing the *crêpe* ribbons of mourning. Near them a few passers-by were standing reverently looking on. I waited. The hearse drove closer to the door, and later bore away the coffin. No military pomp or display! A splendid hero had given his life for his country, and this was his simple funeral. Above, on the window balconies, some maids stood looking down, crying, and wiping their tears away with their aprons. This 'colonel' had lain only four days in the house of suffering, but in so short a time had been beloved enough to be missed. The gendarmes followed slowly, and in the rear a motor-car bore a military official. That was all! The sun seemed to cease shining, and the world looked cold and gray. A taxicab hovered in sight. I hailed it, and, entering, bade the driver accompany the solemn cortège slowly. I had a sudden wish to follow this soldier to his resting-place, and as I did so my thoughts were sad ones. How many thousands of such deaths could this war already account for, and how many thousands of hearts had it broken?

THE HOSPITALS.

Visiting many hospitals in which the sick and wounded are being nursed and cared for, I was impressed to an extraordinary degree by the buoyant spirits of the brave men, and the joking way in which they all, without exception, referred to their various injuries in answer to my inquiries. To me each man I talked with meant a sermon, and I think I never before so fully realised how proud Britain should be of its fighting man, lying in his bed handicapped by terrible wounds and sufferings, and yet smiling and happy, bemoaning

nothing but his present helplessness against his wish to be 'back again, potting at the enemy.' He is weakened in body, but never in spirit!

Everything is done in these hospital-palaces to render the wounded man all possible surgical and nursing skill, with every degree of comfort and even of luxury. His smallest want is supplied, and neither time, patience, nor expense is spared.

I always enjoyed my visits and talks in the hospitals, although, as I looked around the wards, the sight opened my eyes very widely to the cruelty of it all—the heavy human price that war demands.

A jolly Irish boy, one of the 'pets' of the ward in a certain hospital, was always smiling when I found him, and cracking jokes with his fellow-sufferers in his broad Irish brogue. His case was a serious one, and his sufferings at times intense, yet he could be so full of spirits! One of the nursing Sisters informed me that he had already undergone six surgical operations, and that in all probability he would undergo still more, and even then he would never regain the use of his legs. Another youth of only eighteen years sat propped up in his bed, with an expression of intense suffering on his flushed face; but he was able to give me a wan smile now and then as I talked with him. The evident pain and difficulty with his every breath was terrible to behold, for he, poor fellow! had been shot through the lung, and his recovery was very uncertain.

Sitting at the bedside, one afternoon, of a 'giant' belonging to the famous Scots Greys, I listened to his tale of Mons. He told me, with awed voice, and with tears very near his eyes, that the battle had been just a gigantic murder, and that only those who had fought on the battlefield realised it in its blackness. So many of the worst sufferings, I learned, had come from Mons.

Some of the sunniest afternoons I spent in taking the convalescents for motor drives in my friends' car. Sunken in pillows and wrapped in rugs, Tommy or Sandy or Pat saw Paris in this way for the first time, and these outings were as enjoyable to us as to them.

Besides the Paris hospitals, I journeyed out to many farther afield. One of these—a beautiful château—particularly appealed to me, situated in its own grounds, with ornamental lakes and terraces, and the sunshine lighting up the rich autumn tints of the trees. The sick and wounded there were in the very lap of luxury, peace, and contentment. I spent quite my happiest day there, but for the marring by one little black incident.

While I was being taken through the beautiful wards by the kindest of doctors, he specially pointed out to my notice two tiny cots. In one was a small boy suffering far too acutely to care

about the toys at his side, and in the other cot a still smaller girl of about two and a half years. The little mite was stroking a woolly toy dog, and she stroked him with her left hand, for the right hand and arm were missing. Strapped across her small pale face was an eye-guard hiding the unsightly gap, for her left eye had also gone. As my doctor friend told me the harrowing tale over these two little beds I was speechless. I could think of nothing to say. It so happens that the case was not one of the German atrocities; but unfortunately the family, in their small house, had unavoidably been in the range of the cannon some miles away during the fighting near Braisne. The cottage had been blown to pieces, the mother killed instantly, and the father now lay dying in this same hospital. The little boy had both legs badly hurt, and the amputation of one of them would be imperative; the little girl had lost her right arm and her left eye. Can any one think of a future for these poor little human wrecks? What does there seem left for them in life?

A VISIT TO THE BATTLEFIELD OF THE MARNE AND MEAUX.

It is perhaps a personal visit to one of the recent battlefields that can make one only too fully realise war and all it means, and this realisation was brought home to me very forcibly during the visit I made to the battlefield of the Marne.

Naturally it is a most difficult time to make such a journey, and the obstacles which must be overcome are numerous and formidable. However, I determined not to be discouraged, and I set out to interview various police and military officials, to whom I presented my necessary credentials. Whilst I found these officials, without exception, most courteous, it was made clear to me that their permission would probably be very difficult to gain. Fortunately in the end I was successful in my efforts, and started on my way with the desired permits and passport.

All journeys from Paris were slow and uncertain, with very few trains, and none guaranteed. Such was the journey to Meaux, the place now associated with the fighting of the early days of September last.

A number of French cavalymen boarded the train on their route to *les lignes de combat*, and we moved slowly out of Paris. From the carriage windows on either side suburban and peasant life seemed undisturbed. Here, at least, it was difficult to realise war; but later, when we were forced to remain stationary for the passing of a Red Cross train filled with wounded, or shunted for an artillery train on its way to the front, we opened our eyes to war once again. Toward the end of the journey our train slowed down to a crawling pace, carry-

ing us carefully over the temporary bridge of Lagny. The original bridge had been blown up, and many workmen were now engaged on its reconstruction. On both sides were notices warning us of the danger of putting our heads out of the windows owing to the nearness of the girder supports. Below, we looked on the narrow part of the Marne River and the wreckage on its banks. The old bridge near the mill was in ruins, and the little floating bathing-houses had been scuttled to prevent the Germans making use of them as pontoons. Every scene as we approached showed evidence of battle, and I felt already steeped in its atmosphere. At last we steamed slowly into the station of Meaux, and I made all arrangements for my visit to the actual battlefield and the surrounding devastated country.

Entering the quaint and somewhat ancient town of Meaux, I wondered how it had escaped the bombardment of the Germans, for surely the fine old thirteenth to sixteenth century cathedral would have appealed to them! However, they spared it; and the little town seemed almost normal again, as I drove through, and up the hill beyond, on to the village of Champéry.

Here, for me, commenced the saddest of experiences, for I was looking on the first of the rough and lonely graves of the fallen. I preferred to walk by them for a closer inspection; and, kneeling beside one mound in a ditch, I saw it bore a roughly made wooden cross, and at the foot of this some withered flowers, with a card on which was written the following: '*Simplex fleurs des champs offerts par leurs parfums à nos vaillants soldats.*—LOUIS ET ALICE.' This little touch of sentiment was evidently the work of the village children, and I thought it particularly sweet.

Another grave, perhaps a trifle less rough than others, bore an inscription on its cross, telling that the lieutenant-colonel of the French army buried there 'wished to sleep for always on this spot.'

Leaving the roadside, and walking toward the centre of the actual battlefield, I found a large square grave in which were buried four French heroes. There were four crosses, one at each corner, and on these were hanging weather-beaten tunics and caps, showing many traces of the recent battle. This one little bit went very near my heart, as it would to all lovers of animals; for by this grave I found the lonely figure of a small dog keeping watch, and daring me to venture too near. He allowed me to pat him after a while, but dejectedly refused the biscuits I fetched for him from the car. He seemed beyond all comforting; and finally I had reluctantly to leave him there to mourn his small dog-heart away and to starve his already emaciated little body. He looked such a pitiful little fellow, but it was beyond all human power

to persuade him to leave his post. I learned later in the next village that he had been the pet of these four dead soldiers, after they had rescued him from a burning barn.

Walking on, I saw hundreds of mounds, one very large containing twenty-eight bodies of the French; and from near this scene I have several mementos, amongst which are part of a torn sleeve of a French tunic; a portion of a German *Hausfrau* (or 'ready work-basket'), in the form of a piece of cloth with a marked tape attached bearing the official number of its owner, and a number of various-sized buttons sewn thereon; a German shell-case, now emptied of the shrapnel, which has caused such terrible suffering amongst the soldiers of the Allies; and the screw top of a smaller case belonging to French ammunition.

Larger mounds indicated the graves of faithful horses, and on all sides of these the ground was scorched and blackened from the effects of the oil used in burning the bodies of the animals before burial.

Some of the German graves had large numbers of bodies interred in them. They were evidently very quickly made, for they were extremely shallow and rough, with no cross on any one of them.

I noted that the French were mostly placed in individual graves, and on many of these had been strewn the tricolor flowers of the field. Another inscription I read was as follows: ' *Ici Repose Henri Brumeaux, D Infantry, Sergeant 282.*'

Indicative of the way in which haystacks have been used as shelter was the number of graves around them, where the sheltering men had been killed; and it is noteworthy that in so many cases the haystacks themselves remained quite unharmed.

All along my way the graves of men and horses were spread over the fields or in the grassy ditches, with the wild signs of the spent battle around them: ground upheaved, crops trampled and scorched, trees broken and hedges hewn down to give a clear firing view from the trenches of the ditch. In many of these ditches the Algerians had taken their positions during the firing. The French sign-post near by, made of iron, was so riddled with bullets that it was impossible to read its directions; and close to where I was standing was a thick growth of Indian corn, entirely spoilt owing to a fierce hand-to-hand bayonet fight having taken place in its sheltering thickness.

Now all seemed peaceful. Men were replacing the telegraph wires which the enemy had cut, and peasant women were labouring in the fields. The sun was shining; the sky was blue; but as I stood there, among those lonely graves, I again thought of the vast human sacrifice of this terrible war, and the relentless heart of its instigator.

ONE OF THE DEVASTATED VILLAGES.

Leaving the scene of the battlefield, I drove on, with evidences of the late struggle on either side of me, to the ruined village of Barcy. Here peace could now be found, but a peace full of sadness, for the few inhabitants who had returned after the fighting had found their village wrecked by shell and fire, and all that belonged to their simple home-life utterly destroyed. A few of the cottages had, curiously enough, escaped damage, except for broken window-panes. Outside these cottages stood the peasant women, with lost and aimless expressions, and their children played around the ruins of the school-house. Everything was at a standstill; no work for the women, no lessons for the school-children, and no service in the church, for, as usual, the enemy had worked more havoc in this picturesque little church than in the rest of the village. After the shelling it was the deliberate order of a German officer that it should be burnt, and all that remained intact in the interior was the old brass bell lying at the foot of the belfry. The schoolhouse, because of its vicinity to the church, had suffered much in the same way; and all that remained of some houses opposite was a heap of bricks and mortar.

Standing near was a poor old woman, who told me that she was rendered homeless. She was now eighty-three years of age, and had spent her whole life in this simple village. The telling of her story to me seemed to open her heart-wound afresh, for her poor old frame shook with sobs, and tears rolled down her withered cheeks. One felt a sense of absolute helplessness whilst listening to such tales of sadness, for of what use is the offer of sympathy or money when the cherished homes and possessions of these simple peasant-folk are lost to them for ever? Farther on I passed many such wrecked homesteads—windows broken, portions of roof blown off, large holes in the walls, and many other instances of the ravages of warfare.

One of the sights which sadden my memory was the little cemetery lying peacefully a short distance from the village. Here were trees burnt and broken, tombstones shattered, and the surrounding wall riddled with shot-holes. A number of newly made graves were outside this cemetery wall, and in these had been buried the bodies of the soldiers who had fallen in the fight. Inside the gates the sleepers had been laid to rest with reverence and in silence and peace. Outside, the fallen heroes had been placed in their crude graves in reverence, it is true, but in haste and amidst the din of war.

From this scene I returned to Paris, and ever since I have felt the war very near me. We have only to think of the many hundreds, and hundreds again, of graves that have been filled since this battle of the Marne, and of the many

wounded who have gone to the hospitals, to have the war brought right home to every one of us.

If we are men, and realise, we can act on

Nelson's famous words; and if we are women our realisation must come through the softer duties of womankind. We have thoughts, we have women's hearts, and we have sympathy!

THE STRANGLERS OF POLP.

CHAPTER IV.

THEN there was an end to such apprehensions as still lingered in the Duke.

It was a spacious two-windowed chamber of the kind technically known as a bed-sitting-room, its principal article of furniture an old four-posted bed with tasselled hangings, upon which lay in massive length (more than seven feet of this) Apollonius Kragatz, the Chieftain of Polp, his eagle-beaked profile, vast chest, intricately curled white moustache, and white beard reaching nearly to his waist, all shown up strikingly by the light of a round-globed lamp on a table by the farther side of the bed. His eyes were closed. He was dressed in a frock-coat, black trousers, and common shiny boots, with a peep of purple socks at the ankles. Thus lay in state this dreadful old chief of the Strangers of Polp in a Soho Street lodging over a laundry-shop!

Yet no, he was not dead; for scarcely was this startling impression of him registered in the Duke's brain when he marked a faint undulation of the chieftain's chest, telling of breath still in his vast body.

And then the young strangler of an hour ago came again into the scene, with a recurrence of those bashful confusions which had made him so interesting to the Duke at the Ritz, both before and after his attempt to murder.

'Ah!' said the Duke as softly as one in the presence of death, 'I rejoice that I see you safe, my boy. But what is the matter with him?' He approached the bed, and for a few silent seconds viewed the old chieftain's bulk. Then a whisper of admiration, 'So this is Apollonius Kragatz of Polp!' stole from him, and he glanced round inquiringly at the young man.

He understood then why Pedro Kragatz was so tongue-tied.

'Oh, don't have any fear of that kind, my boy,' he said, gently reproving in tone and look. 'I am by myself, of course. What must you think of me to imagine I could do a thing like that? See! I shall shut myself in with you alone. And now, what is it all about? I come expecting to have perhaps to box for you like a—Jack Johnson, let's say, and I find—Ah, but you must forgive. I forget myself. He is poorly, your father, then—very ill, I'm afraid?'

He turned again to the chieftain, and simultaneously Pedro Kragatz made a quick movement to the head of the bed. There, with his

lips close to the monumental old chieftain's ear, the young man uttered a glad-voiced proclamation in the Blenarian language. The Duke caught his own name in it, and that was all; but was soon enlightened about the rest of the communication.

Leaving the unconscious chieftain to himself, Pedro Kragatz stood up and explained, his eyes attractively bright with youthful ardour. 'I've told him you are here, sir; but it's no good yet, the poor old man! There was a quarrel between them, sir, when he said, "I am for the King Ulric," because—because you were so generous to me, sir, in letting me go. He could not at first believe what I told him, and then it seemed suddenly to change him into a different man altogether. He became so excited, and had words with—I must not mention his name, but he is a Blenarian from Geneva—and he lost his temper, and was choking that man with his own hands when his heart failed all in a moment, and he fell down on the bed. We all thought he was dead, but he will not die that way. When his heart has rested he will open his eyes, and, I think, be quite all right again. It is not the first time he has had these attacks. My mother has written to me about them, the poor old chap!'

The Duke nodded and nodded.

'Yes, sir, and he'll give his life for you from now, you'll see; the same as I will, if it can do you any good. I'm sure of that, sir. Because you didn't kill me like the rat I was when you had me in your power,' Pedro Kragatz went on eagerly.

'*Mon Dieu! Mon Dieu!*' murmured the Duke. He raised his hand to his forehead. 'I am not dreaming—no? You are like that in Polp, then?' he asked, with a smile. 'You change so pleasantly when the right button is touched—eh? Just tell me I'm not asleep too, like your father, my boy.'

'We're a shocking lot, your Majesty, in some respects—downright rotten,' said Pedro Kragatz after a moment's hesitation; 'but if a Kragatz of Polp says—'

'Ah, just so! I understand that, and it makes up for a great deal.' The Duke's smile increased in graciousness. 'You make me very happy, my boy, and I shall believe all you tell me, except what you say about being so rotten. But I think I must go now, while I am so happy about everything, and will leave you to

do what you can for your father. That is true wisdom—eh, young Pedro?

He held out his hand, and insisted on its being taken, not kissed as by an inferior. Next he touched and pressed his palm to the nearer of the huge Chieftain of Polp's own knotted hands. 'What a magnificent old gentleman!' he said. 'I did not think there were such Sons of Anak still to be seen.' And to the chieftain himself, 'We shall meet, I hope, soon, in Blenaria, my friend.—You must make him well, my boy, and let me know the first thing to-morrow if he is better. Now that's all, I think; so good-bye.'

The Duke pinched the arm of Pedro Kragatz caressingly, and strode to the door; then turned and gazed about the room. 'I am not yet quite certain that I have not dreamed it all, you know. You do not look like the kind of young man to—to——' He raised his hand to his neck. 'You think there is an end of that—eh?' he whispered, smiling and shaking his head.

Crimson with shame, Pedro Kragatz burst forth into passionate assurances on that point. Hitherto he had deemed it his duty to obey his father's bidding in everything, even to the taking of life and the surrender of his own life. That was the way with sons in Polp, especially the sons of such men as his father. 'But after to-day I have my senses the same as an Englishman, and by God and all His saints, sir'——

The Duke held up his hand. 'There, there! that's right; cheer up! You will make yourself poorly. I quite understand. It is what we have all to do in this rather difficult world—just keep our senses. Good-bye, my boy!'

Closing the door softly upon the young stranger, whose emotions threatened to choke him like a Blenarian garrotte, he descended the stairs in the dim rosy light of the lamp to the plaster effigy of the Chieftain of Polp's own particular saint. He reached the street without aid or hindrance from the *blanchisseuse's* urchin, and commandeered the first policeman he met for the speediest possible assistance back to the tarrying taxi.

'The Ritz Hotel, fast as a witch on a broomstick, my man!' was his gay order to the driver.

Having torn up the now useless note in the car, he folded his arms and seemed engrossed in the lights and traffic of the streets, save at one time only, when, with his hand to his heart, and the talisman still close there, he exclaimed, 'Yes, it is a power like no other to a man—a dear woman's faith in him!'

The journey over, he gave the taximan another golden reason to think well of him, and entered the hotel.

'Ah, my dear bull-dog!' he said briskly when Von Enselsing once more hastened to him

in the vestibule. 'Come! we shall eat our dinner with his Italian Excellency after all if we make ourselves hustle.'

All he said else until they were in his dressing-room, and Hans had relieved him of his heavy coat with glad eyes, was this, 'You are to ask me no questions, my Albrecht; but I shall tell you this without being asked: I have had an adventure. It was like something in a sensation story that fellows spin out of their heads. I don't know, though, that it was so exciting as it might have been. In the newspapers you will find every day much more exciting real things; just as unlikely ones too, although they are true. It is a century of improbable doings, this twentieth. Like Blenaria, that is to be our new Fatherland—eh, my good fellow! We must be patient with these people when we get there three or four days from now.'

'Yes, sire, we must be patient,' said Von Enselsing. He longed for the details of the so-called adventure; but, since he had no alternative, he bided the Duke's goodwill in the matter.

In the corridor the Duke broke into a song, and he was singing still, softly, as if for his own satisfaction exclusively, while he washed his hands, when Von Enselsing reappeared with a telegram.

'This has just come, sire,' he declared.

'Open it and read it to me,' said the Duke. But he held out his wet hands for it the next moment. 'No, give it to me.' As he guessed, it was from his and Blenaria's queen, and he soon looked up with a smile that was itself a sufficing answer to the inquiry in the aide-de-camp's eyes. 'Yes, all goes well over there, Albrecht,' he informed him. 'They have snow in Blenaria this afternoon, though. Just think of that—snow in May down there! I tell you what you shall do. Telegraph once more that all keeps well with us also. Say we have sunshine and spring promise here, in all meanings of the word. You see?'

'Very good, sir,' said Von Enselsing.

'Ah, yes; and there's something I was just thinking I would do,' the Duke continued, with a sudden laugh. 'You know that little lead cross of Altenfeld—"For Bravery," they called it—which the *bürgermeister* presented to me for pulling a little girl out of the ice three winters since when there was no one else near enough. It is the only decoration I shall wear to-night. It will be amusing to see the others ask themselves what it means—a little simple thing like that without any diamonds. My faith! there wasn't much bravery in just wetting my feet; but it is a fancy of mine to wear it, because you know we are going to a country where we shall have to make a show of being brave, whatever we feel like under our coats—eh? But don't you tell any one the story of the little lead

cross, or I'll wring your neck like—— By the Bones, yes! There, that's all. Go, my good fellow.'

The Duke turned and took up the soap-tablet

again. The sudden passing of his smile and its equally sudden reappearance after his pause were a little riddle to which, of course, neither Von Enseling nor the valet had the key.

THE END.

THE MONTH: SCIENCE AND ARTS.

THE PRITCHARD MILITARY HUT.

IN the housing of the Kitchener army, the difficulty attending the erection of accommodation for troops, hospitals, and other buildings required by the Allies has been overcome by a design displaying commendable ingenuity and simplicity. Considerable interest has been manifested in the military or medical hut devised by Mr Henry M. Pritchard, A.R.I.B.A., which has been inspected by officials from the War Office, the medical authorities, and others. The outstanding feature of the hut is its comparatively small cost; indeed, the inventor claims that a saving of 25 per cent. upon present expenditure on a building of similar dimensions can be effected. This hut measures twenty-two feet in length by fourteen feet in width, with a sloping roof fifteen feet in height at the ridge, and covered with thick canvas to ensure dryness; while ample ventilation and light are secured. The essential interior fittings are extremely ingenious, as they are placed where the most economical use can be made of available space. As the huts are collapsible, they may easily be taken from point to point when necessary. The hut costs about a hundred pounds, including the cost of erection. It is of sufficient size to accommodate fourteen men for sleeping, and in an emergency two extra men can be accommodated without discomfort or overcrowding.

ELECTROLYTIC DISINFECTION.

The complete sterilisation of goods at the laundry at a reasonable expenditure is a problem of considerable importance to the authorities who are charged with maintaining sanatoria and hospitals. The method hitherto most generally adopted for the disinfection of clothes is baking or washing in germicides. A mental hospital in the south of England has established a plant for the production of a hypochlorite solution for the purpose, and according to report the experiment has proved highly successful. The hypochlorite of soda is produced by the electrolysis of a 4 per cent. solution of common salt in water. The output of the electrolytic tanks is twelve gallons of the hypochlorite solution per hour at a nominal cost for electricity. The solution has to be diluted with nine times its volume of water before it is used. Such a solution is quite effective in the destruction of micro-organisms, and removes all stains. The

system is inexpensive, and does not appreciably affect textile fabrics.

RIFLE-FIRING IN THE DARK.

The activity of the sniper under cover of darkness has been responsible for much inventive ingenuity with a view to facilitating rifle-firing at night. Two ingenious devices have been perfected, one by a Glasgow staff-sergeant and the other by an Australian explorer. At night there is difficulty in directing the muzzle of the rifle upon the enemy, owing to the invisibility of the ordinary foresight. To meet this, the Scottish musketry instructor has fitted the ordinary service rifle with a luminous sight. No alteration in the service arm is necessary, and the night-sight does not interfere with the ordinary front-sight for daylight shooting. The new sight has been subjected to exacting tests, and has proved highly efficient, only four misses being recorded out of fifty-four rounds in a trial under difficult conditions; and it has been applied to machine-guns with equal success. The Australian invention consists of a quick sight electric flashlight, which is fitted close to the muzzle by a simple contrivance, the current being supplied from a small battery carried in the butt, to which the sight is connected. The light throws a T-shaped mark which provides an almost automatic aim, because the bullet strikes at the intersection of the two lines. The sight can be fitted to any firearm, and the flashlight can also be used for signalling.

TELEPHONING FOR BULLETS.

War is a stimulus to science, and this is reflected very strikingly in matters pertaining to the relief of the wounded. The search for and extraction of fragments of shells is no simple matter, although surgical endeavour has been facilitated by the perfection of the X-rays. But these are insufficient. A bullet may be located speedily, but the difficulty is to ascertain its precise position by the probe and lancet. As a result of study and investigation, a simple and effective method of discovery has been perfected, which may be described as telephoning for bullets. Ordinary telephonic receivers are clamped over the surgeon's head, one wire being led to a carbon plate, and the second wound round the knife, probe, needle, forceps, or whatever instrument is used. With this implement the search is made, and directly it comes into

contact with, say, a bullet, a distinct click is heard on the telephone. If the instrument is rubbed across the surface of the buried object a rattle is observed, and by following this clue it is possible to withdraw the bullet or fragment of metal. The idea is by no means new, inasmuch as it was employed for the first time during the Boer war; but the present campaign has served to bring it to a high state of perfection.

IMPROVING THE COAL-FIRE.

A British inventor has introduced an appliance which should appeal to the householder, as it is claimed to reduce the coal-bill considerably. The invention is applicable to any grate in which coal fuel is used. It consists of an incandescent fire-mantle of special design and composition to ensure long life, which is merely placed in the centre of the grate and surrounded by coal. By means of this mantle the complete combustion of the coal is assured, as it utilises in a scientific manner the heat energy created by the burning fuel, which, instead of escaping up the chimney, raises the mantle to incandescence. The result is the production of a white-hot mass in the centre of the fire, which continues so long as any of the coal is unconsumed. Naturally the presence of this seat of intense heat must bring about the complete consumption of all products of combustion, while at the same time greater heat is emitted. Not only is the smoke nuisance lessened, but the fuel burns more slowly. Thus pronounced economy in fuel consumption is inevitable. The mantle is virtually everlasting, and gentle handling is not imperative.

A NEW DOOR FOR STRONG-ROOMS.

'Safe bind, safe find,' runs the old adage; but nowadays, owing to the scientific safe-breaker and his resort to high explosives and the oxy-acetylene blowpipe, the contest for supremacy between the safe-maker and the safe-breaker has become abnormally acute. But the safe-maker has forged another stride ahead. The Chubb triple treasury door is able to resist every known form of burglarious attack, even liquid explosives and the blowpipe. One of the outstanding features of this door is the inclusion of what is described as the crane hinge, by means of which the last movement in closing the door is a direct inward drive; and as all edges of the door and frame are square, an air and water tight fit is secured. The door is no less than eight inches in thickness, and it is built up of layers of armour-plate, tough steel, and materials which are resistant to the action of the blowpipe. The door is of immense weight, as may be supposed, representing, together with the frame, six and a half tons. The locks, of the keyless combination type, are additionally checked by a time-lock, provided with four independent chronometer movements, which secure the door against opening after being closed unless one

knows the combinations used for setting the lock. This system is particularly useful to secure the door during the week-end, since it can be shut permanently for any length of time up to seventy-two hours. The frame of the door is made of extremely heavy cast-steel, built in one solid piece, thereby giving very pronounced rigidity to the whole construction. These doors can be adapted for use in any strong-room. The fact that they represent a decided advance in the safe-maker's art is borne out by the number of banks which have fitted their strong-rooms therewith.

A NEW AMBULANCE TOURNIQUET.

An improved tourniquet for ambulance work has been devised, and utilised on the Great Western Railway with conspicuous success. The outstanding feature of this instrument is that it can be applied or released instantaneously, whilst when it is in use the pressure is exerted directly downwards on the pressure-point only. This is a far more important feature than it appears from the cursory point of view, as the average tourniquet either restricts the use of the limb completely, which is a matter of considerable risk to the patient, or is secured by means of a spiked buckle on one side of the pad or block, the result being that upon the application of pressure the pad becomes displaced or the strap weakened when it is punctured. In the 'Western' tourniquet, as the latest device is called, the strap is not punctured, and there is no one-sided pull. This new instrument is simple in construction, and cannot get out of order, while there are no rubber parts to perish. It has the advantage of being hygienic, because all parts are washable; while the pad is non-absorbent. The construction of the contrivance follows such lines that it is capable of application by the sense of touch alone, which is a valuable feature when it is remembered that a tourniquet often has to be applied in the dark. The tourniquet is of the 'pad and strap' type. To the block, which may be of vulcanite or any other suitable material, a metal plate is attached, one end forming an eye, and the other an open hook. A special form of spikeless buckle is fixed permanently to the eye, while a detachable buckle engages over the hook of the metal plate when the instrument is in use. The strap of the tourniquet runs through the two buckles, the strap comprising two lengths of webbing placed one over the other, and stitched across at frequent intervals, the ends of the webbing being made thicker, so that it cannot be detached from the hooks. In application the loose clip is removed from the hook, the block is placed on the pressure-point, the strap is passed round the limb, and the loose clip replaced over the open hook. Pressure is exerted on both ends of the strap, and the block is forced directly downwards on the pressure-point, thus arresting hæmorrhage.

To remove or adjust the tourniquet the release tongues are pulled with an upward motion, when pressure is released instantaneously.

MORE ABOUT THE RIDDLE OF SPACE.

The attainment by the physicist of the lowest possible temperature (see article in our February issue, in which for 'Fahrenheit' read 'Centigrade') was not, *per se*, so much the goal as the demonstration of what happens when there is an entire absence of heat. Tyndall, in his monograph, *Heat as a Mode of Motion*, did not foresee or even suspect the behaviour of matter or molecules when heat was entirely eliminated; hence many of his deductions were erroneous. It is the presence of heat in the smallest degree that, in connection with our investigations of the ultimate nature of matter, obscures and confuses the results of our researches. The first fact demonstrated by the conditions that are manifested when all the heat is removed is that a great obstacle to the free passage of energy has been taken away, and an open door—or, to be technically correct, a frictionless state—arrived at, a state that always exists in 'space'; so that the passage of energy is perfectly untrammelled, and it traverses the great ocean of space without loss in its varied flights from suns to revolving planets, and from planet to satellite, the transmutation of energy only occurring when on its journeys it meets with matter in any form, whether gas or vapour, liquid or solid, except when they are at a temperature of actual zero. Then the 'laws of space' obtain. Before these low temperatures could be accurately measured a thermometer had to be devised by Professor R. Onnes. This was constructed with the aid of helium, in the form of a gas thermometer, capable, by the contraction of this gas, of indicating the low degrees reached. The greatest difficulty to be surmounted before these experiments could be conducted on a suitable scale was in obtaining a sufficient quantity of helium, amounting to several hundred gallons. It was impossible for Professor Onnes, with the apparatus at his disposal, to collect enough helium, and the price of what was obtainable in Europe from other sources was prohibitive, being at the rate of five pounds per pint! However, he was not discouraged, but caused inquiries to be made in the United States, where he obtained a generous supply of helium at a greatly diminished cost. One illustration only need be given to show the wonderful disappearance of 'resistance' in metals when all heat has been abstracted. Mercury is a very poor conductor under ordinary conditions, offering fifty times greater resistance than copper. Now, under space temperature conditions a wire of frozen mercury one millimetre in diameter will easily carry a current of one thousand amperes, sufficient to light two hundred ordinary incandescent lamps. An illustration of one of the numerous practical uses that arise from these far-

reaching discoveries is that storage-batteries and accumulators, which usually take many hours to charge, can be fully charged in as many minutes—an enormous advantage in cases of urgency. But the great vista that opens to the scientific mind is what wonderful results will arise from physical and chemical investigations conducted at these minus temperatures. It means revolution in every branch of science. In conclusion, these are the attributes of 'space.' It is illimitable, unchangeable. It is the only medium for the transmission of energy throughout the boundless universe without friction or diminution in any degree. It may be compared to what is known in physics as a vacuum, for the sake of demonstration or illustration. For the minus temperature that prevails in space separates the whole immeasurable universe into matter and space, the one ever changing its form, the other unchangeable and without limit! And yet it is held also that the all-pervading contents of space permeate all matter. Heat as heat is never present in the great ocean of space, nor light as light; they are only manifested in the presence of matter.

CHEAP FOOD FOR PIGS AND POULTRY.

In the olden days the common domestic animals were not fed indoors to the same extent as to-day. Even the pig and the fowl were turned out into the field or wood to find their own food. There is evidence of this in the names given to some of our common plants: goose-grass, sheep's parsley, cow mumble, hog's parsnip, sow thistle, chickweed, duckweed, &c. These were supplemented in the autumn by more fattening foods, such as acorns, beech-mast, butter-herbs, and rose-hips; then, as winter approached, the animals were killed and salted down. After all, this is common-sense. A gentleman has dissected the crops of the wild pheasant, partridge, and wood-pigeon; and, with the exception of just at harvest-time, no corn has been found, nothing but weed-seeds, green food, acorns, beetles, and such like. At the time of year when they are laying a nestful of eggs or rearing their brood there is no corn to be had. It is not generally known that all the thistles, together with the stinging-nettle, are very valuable feeding material. As the roof of the mouth of pigs is made of bone, they can eat even the boar thistle with impunity and the nettle without being stung. The small-holder is greatly handicapped in one respect. The chaff-cutter, at a cost of from three to five pounds, is quite out of his reach; so he generally contents himself with throwing his green food over into the fowl-run or hanging it up by a string. A neat machine is in use that fits on an ordinary pail, and cuts the food quite small or long at will, the knife working through a slit, so that it has great power, and does not get blunt, as is the case when used on a board. The food falls into the pail as it is cut; after which the whole is wetted and then turned out

into a box, and well sprinkled with meal in the ratio of one-sixth meal to five parts green food. This will grow and nourish all the frame of a fowl, duck, or pig, and the fat can be put on with extra meal later. A number of wild herbs, many of which the ordinary man would not think of using, are mentioned as good wholesome food for the pigs and poultry.

BENZOL AND COOKED COAL.

In his article in our January issue on 'The Domestic Fuel of the Future,' Mr F. Swann wrote that 'the domestic fuel of the future is likely to come to us as a by-product in the manufacture of oil from coal.' The matter was again referred to in our March issue, where mention was made of various British firms, including the British Coalite Company, of Barking, Essex, which have thrown light upon the potentialities of the low temperature distillation of coal as a source of oil as well as of an admirable domestic fuel. A *Times* correspondent has pointed out how this method of distilling coal has been forced upon the Germans to replace petrol. He says that the seizure of Galicia by the Russians, and the consequent stoppage of the supply of petrol, was one of the severest blows to Germany, which relies chiefly on motor transport for military purposes, and particularly for its aeroplanes and Zeppelins, not to mention the countless motors used for private purposes. It is unquestionably true that the situation was serious. For a time all private motor traffic was at a standstill. But now benzol, as it is called, which is easily and cheaply obtained in great quantities from coal, has taken the place of petrol. The coal is thereby converted into coke; and, with painstaking thoroughness, the German Government set about to find a market for the great coke-supply that was thus created. Locomotives are being converted to burn coke economically in place of coal, as are other steam engines and furnaces. So that to-day, notwithstanding the enormous consumption of benzol for military use, the supply is more than equal to the demand, and taxicab and other motor traffic has again resumed almost normal proportions.

KAPOK FOR LIFE-SAVING BELTS AND WAISTCOATS.

The wonderful utility of kapok has been lately brought prominently into notice. At least three varieties of garments are designed for the above-mentioned purpose. Gieve's waistcoat, the Boddy jacket (the invention of Mr G. M. Boddy), and the Miranda waistcoat have been tested and adopted by the Admiralty. The *Times* says there is evidence that some of the survivors of the *Formidable* owe their lives to one or other of these devices. The Miranda waistcoat, as made for the Admiralty, is of blue dungaree lined with holland, and derives its buoyancy from a quilted padding of kapok. This is a soft, silky, elastic fibre

found in the fruit-pods of *Eriodendron anfractuosum*, the silk-cotton tree. It resembles cotton in appearance and structure, but is softer and silkier, and has immense advantages over cotton, wool, or silk. It is produced in Java, Asia Minor, Africa, and India; it does not rot, is non-verminous, and is impermeable by water. For a long time the flossy kapok was used for stuffing cushions and upholstery, for which purpose its elasticity made it specially suitable. Of late years, however, its extreme buoyancy has brought it into use for life-belts and similar apparatus. Exactly one pound of kapok is used in each waistcoat, all except two ounces being in the front, and the mass is so distributed that the greater portion covers the upper part of the chest. By this means, whether the wearer be conscious or not, and whether he fall into the water head-foremost or otherwise, his face is brought above the surface. The total weight of the waistcoat is about two pounds six ounces. It is said to be far warmer than, and only one-tenth the weight of, wool. These properties have been further taken advantage of by Mr Boddy, who, with the help of a scientist, has discovered another method of utilising kapok in life-saving appliances which will in due course be made available to the public, and may effect an enormous development of our industries.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

FOR A SOLDIER'S WEDDING IN WAR-TIME.

O God of Love, of Whom our love when dearest
Is but a gleam to guide our hearts above,
When most we need Thy presence come Thou
nearest

In guardian love.

O God of Hope, give strength in time of sorrow,
Give courage that with darkest fears may cope,
Give steadfast patience for a fair to-morrow
To wait in hope.

O God of Peace, above the stormy weather
Make Thy voice heard, and bid the tumult cease;
And grant to these whom Thou dost join together
Long life and peace.

E. ADA TYACK.

. TO CONTRIBUTORS.

- 1st. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'
- 2nd. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3rd. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

Chambers's Journal

SEVENTH SERIES

A BAYARD OF THE BUSH.

By H. LESTER.

CHAPTER I.

SHE shrank dismayed before her first impression of Australia—monotonous dry levels, encompassing, yet remote. Through the uncertainty of her position, her life took on the same aspect. To the rhythmic clanking of the wheels, her eyes following the fleeting retreat of sundried paddocks, she attempted to reconstruct the past, to review her own action. Actual thought of the man she had married some months earlier in England she pushed hurriedly aside. He stood for things terrific. She could not even think of him as 'Mortimer,' or of herself as 'Mrs Chesney.'

They had parted—if that which she had never clearly recognised as contact could be called parting—not literally at the church door, but certainly a few hours later at her step-sister's house in Kensington. The only clear recollection she retained of that moment was the glance he had turned and cast upon her before stepping into her brother-in-law's motor, as if seeking something he had not as yet found. A sense of complicity in the unreality of it all enveloped her. Why had she done it?

That the Ingrams had pushed matters to the farthest degree compatible with decency she ruled out of consideration. Since the death of her father, the old colonel, she had lived in her step-sister's house, an alien and unnecessary presence. That they should further any chance of her removal, short of actually sending her penniless adrift, was natural.

She remembered that she had been vaguely attracted by a lifting sense of wider vistas and a more complete life. The easy assurance of the Australian, meeting all experience without surprise, lounging silent and unimpressed before the pageant of life in the Old Country as seen from the altitudes of Kensington, where he was staying, during his brief trip home, with wealthy Australian cousins, acquaintances of the Ingrams, had roused her imagination. Through contact with this quality of composed detachment in him, she, detesting the conventions, contractions, and pretensions of Kensington, prefigured Australia as a land of large simplicities, wide ideals, and untrammelled liberty. To escape to it from the suffocating oppression of Laura's

and Carstairs's aims and ambitions, and from a mode of life which she sensed as the gorgeously absurd, the opulently immaterial, had been a strong inducement; but was it the only reason?

Some subtle reservation of the spirit confused her retrospect. Her ignorance recalled the stir of some elusive emotion, without understanding the meaning of its fleeting revelation. Consciously she had not been swayed by the elemental force of love for the man himself; and with him how had it been? Looking back on his suggestion, it bore somewhat the air of a semi-commercial arrangement.

However their marriage had come about, she was aware that she faced now the vast emptiness of Australia, and the prospect of her life there, with a constricting sense of consternation and immense loneliness.

Mortimer Chesney had not contemplated marriage as a possible result of his trip home. He was, therefore, not prepared to take her back with him to a rough bachelor establishment in the bush. She had been left to follow when her future home had been made ready for her reception. Arriving at Port Melbourne, she was met by a young man who conveyed to her the intelligence that 'their client Mr Chesney had met with an accident which prevented his coming to Melbourne. He had wired to his agents to do everything for Mrs Chesney, and make all arrangements for her further journey up-country to Wangabool.'

That journey up-country alone brought to Janotha Chesney a culminating realisation of her position, which the desolate aspect of the vague little township of Wangabool did nothing to relieve. It weighed on her depression as something monstrous. A huddle of tin-roofed board-houses flung down in the midst of a plain stretching endlessly to no visible horizon. A broad, uneven track struck in apparently from nowhere, and swept out again into unbounded space. A wooden hut and a few planks composed the station, flanked by a couple of galvanised iron tanks. In the small patch of shade they cast was drawn up a strange vehicle—a shallow box, bearing a seat and a leather hood,

swung on leather springs. Harnessed to it with a modicum of gear, a pair of magnificent grays chafed and fretted beneath the controlling touch of a tall man on the driver's seat. The brim of a soft felt hat turned down all round formed an uneven halo about a handsome face. His clothes were badly cut, but hung about his supple figure with an effect of grace.

A being in blue dungarees, who represented the whole staff of railway officials, indicated him as 'Al Walker, sent by Mort Chesney to fetch her along.'

Jan's doubtful glance swept the conveyance and its driver. He met it with a look of easy assurance, lifting his battered hat and smiling. The blueness of his eyes and the warm friendliness of his smile compassed poor Jan with instant pleasure and relief.

'Get right in, Mrs Chesney,' he said, leaning down and holding out an assisting hand. 'We'll hitch up some of your traps, but most will have to wait till we send in the wagons. Guess you're going to start in furnishing all Wangabool, by the look of things!—Here, Bert, put those two on, and take the rest back to the sheds.—Now then, Mrs Chesney. Rather a long step. That's so!'

He gathered up the reins in lean, uncovered hands, flung a 'Good-day, Bert!' over his shoulder to the man in blue dungarees, who shouted, 'Right you are, Al!' and the buggy, with a heavy lurch, was lifted by the released horses from its ratty anchorage, and whirled on to the rough track.

'We are going quick as we can streak for home,' remarked the man. 'I reckon the township's hanging on to its veranda-posts to get a look in at you, but we'll have a good old chip on them by taking the bush-track. If Mort could have come along to fetch you instead of me there might have been a procession. But we'll hustle for home and supper. Guess you're fair tuckered-out with dust and heat and travelling. You can see our ho-tels and stores and private residences another time.' He spoke with the drawling nasal inflections of the born Australian. 'I'm going to do some driving,' he went on. 'Sit tight. When we are through with the creek the track's none so bad.'

The grays sprang to his indicating touch. To Jan he drove with the lightness, surety, and abandon of a young Roman guiding his steeds in a chariot-race. The striving grays responded gallantly, their naked flanks darkly sweating as they pulled the rattling buggy at a hand-gallop through tall tussocks of coarse grass, swishing and swirling, resisting their passage stoutly; over deep ruts; snapping broken boughs, across which they leaped; miraculously shaving the danger of stumps; swaying in and out amidst a jungle of scrub, grass, and timber. The way presently lay wide between a running line of post-and-wire fence bringing them to the creek,

its bed choked with a thick growth of ti-tree, wattle, and Australian honeysuckle; the bending filaments of the tanglefoot creeper dropping a golden-brown veil from bough to bough. The horses plunged down the banks into the apparently impenetrable thicket. Sand and clay and shallow deeps of yellow water they stamped through, dragging the straining buggy from a resisting compound of clay and mud and matted grass on to the comparative smoothness of a fairly level track.

'Don't drive like that in the Old Country, do they?' he asked cheerfully.

The tension of Jan's nerves relaxed. 'Are we near the station?' she asked.

He bent his blue eyes on her in a surprised question. 'Station! What station?'

'Mr Chesney's,' said Jan, in her turn surprised.

'Lord have mercy! There's no station to it. Doesn't run to that. No white-coated gentleman business about us. The boss is on land, sure, but it's way off from being a station. Kind of fruit and all sorts farm. There isn't a name exactly to it as I can hit on at the moment.' He narrowed his gaze, flicking a bloodthirsty fly dexterously from the off mare's flank. 'I reckon the Old Country's pretty ignorant about its brothers across the sea. No clear notion how we do live. They think we're all swaggies, or station-owners, with a bush-ranger or two knocking around.' He looked considerably down at her.

'Mort isn't anything of a palaverer,' he went on. 'He sets his mind on a job, and goes for it without any pow-wow. The silence of the Never-Never has got into him. I reckon he doesn't know just how little he does say. That land of his wasn't a smiling garden—it was as rough-set as this paddock; but we've put in some hard graft; and now there's twelve acres of lemons planted as straight as mathematics, ten of vines—wine grapes—ten of almonds, ten of apricots, and about thirty more apple and all sorts. The water comes from Nantymuck, our big water-reserve, way up in the Ranges. He pays fifteen pounds a year to the Water Trust, and can irrigate all he wants. He's pretty proud of his tank. I took the levels for that. Been out with a survey-camp in my time, and know about all there is to know at the field-work, but no hand in the office—not a draughtsman. It's a black-fellow's life, a surveyor's, but any bit of knowledge comes handy. I've been a blacksmith way back in the Won-Wonda district, and wool-sorter, and wattle-barker, almost anything you like to mention. Haven't had much education otherwise. I reckon you've tumbled to that already? No Geelong grammar or Melbourne University sticking on to me; nothing but what the old state school rubbed in. Mort,' he added, 'he's different. Been through every place of learning we have, stiff with education

he is; the homestead, back there, is fair furnished with books—his nose ain't ever out of one evenings; and yet he's the best sort I ever struck. I knew him for a mate first start off. You can't beat a bushman by much when it comes to scenting out a pal. A mate, we reckon in Australia, is the best thought God Almighty ever struck. He's one as will stand by through wet and through drought, when your pocket's lined with cheques, and when you haven't the price of a drink on you.' He broke off, glancing at the girl's still profile. 'You'll find I'm a nailer to talk, Mrs Chesney!'

She was thinking how appallingly little she knew about the man she had married, and the circumstances of his life. Laura and Carstairs had professed themselves perfectly satisfied as to his pecuniary position. Laura, who gaily pictured the Australian station to which Janotha was going as possibly different from anything she had ever known, yet quite delightfully so, had gathered her impressions probably from his Australian cousins, whose reminiscent talk of the past referred affectionately to dances, surprise-parties, expensive gowns, race-meetings, and 'Cup Day' at Flemington. His own brief references, Janotha remembered, had held the words rough, lonely, solitary; but, he had added, 'no real hardship'; and for the rest, he thought it possible that she might

even find a certain fascination in the bush. He had.

'That's a mortgage-block,' explained Al, pointing to a clearing in the scrub where stood the gaunt ribs of a roofless homestead, with sagging sheds, rotting beneath the dark shadow of huge gums. 'Some fellow's cleared from there, sold up. That's Australia for you! Here to-day and gone to-morrow kind of start. I've always tumbled into a billet myself someways. Been with Mort a good few years. Best boss I ever struck.'

He looked down at her, her silence apparently stirring some question.

'All this seems pretty strange to you, I reckon? "Land of sand and sin and sorrow!" as they say. But it's also the land of you-never-can-tell and you-don't-know-why. It's surprising the way Australia grips. It's got a plain face, but a mighty large heart.'

'A mortgage-block!' Had she mortgaged her life? The memory of her wedding, wearing an aspect distant and fantastic, recurred to her. A glint of satin, the heavy scent of white exotics, the shadowed solemnity of the sanctuary.

'Here we are!' cried Al cheerfully. 'Home, sweet home!'

(Continued on page 294.)

FREE AND INDEPENDENT CRACOW.

By Sir LUDOVIC J. GRANT, Bart.

AMONGST the cities which the operations and incidents of the great war have been bringing into special prominence, Cracow alone can boast a history altogether above the plane of civic chronicle. For a brief period of its existence the ancient and picturesque city on the Vistula enjoyed a dignity such as has never been the portion of Liège or Brussels or Antwerp, of Paris or Lille or Calais—namely, recognition as an independent member of the family of nations. Even Warsaw, its relative and rival, cannot lay claim to a like distinction. True, there was once an independent Duchy of Warsaw, as there was once an independent Republic of Cracow; but the duchy, being an extensive province which actually for a time included Cracow itself, cannot be cited as an example of a town, pure and simple, invested with political independence; whereas the Republic of Cracow was nothing but the town of Cracow and a few square miles of adjacent territory. In short, the republic was a genuine 'city-state'; and, at a season when the public attention has been forcibly focussed on the liberties and rights of the smaller members of the family of nations, it may not be without instruction to take a retrospective glance at the birth, brief life, and demise of the tiny Polish polity.

'The Republic of Cracow, born 9th June 1815, died 6th November 1846;' so, for the eye of fancy, runs the memorial tablet in the Val-halla of departed States. The date selected for the republic's nativity is the day on which was signed the great Vienna Treaty for the settlement of the map of Europe after the Napoleonic wars. It was to the Congress of Vienna, famous scarcely less for its dances than for its deliberations, that Cracow owed its existence as an independent State, and the 'obstetrical committee' (to borrow a phrase from *Sinister Street*) which effected the political bantling's birth included, besides the plenipotentiaries of Russia and Prussia, the weighty names of Metternich, Talleyrand, and Castlereagh. But to understand the circumstances which ushered in this interesting event it is necessary briefly to recall some earlier happenings.

During the last three decades of the eighteenth century a triple series of depredations had effaced Poland, and Polish territory to the uttermost acre had been parcelled out among Austria, Prussia, and Russia. The Partition of Poland, as these infamous transactions are called, exhibited the very essence of true tragedy. The chronic anarchy by which Poland had been torn asunder, in consequence of a radically defective

constitution, and the backward condition of the country generally, had placed temptations in the way of its neighbours, and had even to some extent justified intervention on their part in the interests of their own security and well-being. And so, with the sorrow which the helpless victim's fate inspires, there is commingled a half-suspicion that that fate was not wholly undeserved. At the final division of the spoils in 1795 the town of Cracow passed into the possession of Austria.

A few years later Napoleon was at the zenith of his activity as a jerry-builder of States. By the Treaty of Tilsit (1807) Prussia was forced to disgorge its Polish provinces; and these, with the exception of a strip made over to Russia, were formed into the Grand Duchy of Warsaw, and presented to the King of Saxony. Austria's turn came next. At the Peace of Vienna (1809) West Galicia, including Cracow, was wrested from Francis, and was added to the territory of the Grand Duchy. The Napoleonic arrangements, however, were short-lived, for the Grand Duchy had hardly been constituted when the Czar Alexander proceeded to conquer it. Thus, when the Congress of Vienna met in 1814-15 the *disjecta membra* of Poland had been mostly collected together into the powerful hands of Russia, and Cracow was for the moment a Russian town by the right of conquest.

Of all the matters which presented themselves for diplomatic settlement at the Congress, the question of Poland was perhaps the most important, as it undoubtedly was the most difficult by reason of the rival ambitions with which it was approached. Russia genuinely desired to see the Poles reunited into a nation and a kingdom, but was loath at the same time to lose its hold of the Duchy of Warsaw. Accordingly, the Russian scheme was that the duchy, with the possible addition of some parts of Poland which Russia had annexed in the eighteenth century, should be formed into a Polish kingdom, and that this kingdom should be attached to the Russian Crown—that is, its ruler should be the Czar. The chief anxiety of Austria was that Cracow should not be suffered to remain in the possession of Russia. Prussia hankered after the Prussian portion of the Duchy of Warsaw, and foresaw that if the Polish kingdom contemplated by Russia was formed there would be trouble amongst the Poles not included in that kingdom. But Prussia was willing to forgo its pretensions in respect of the duchy if Saxony, which it claimed by the title of conquest, were permanently assigned to it instead. What Great Britain and France primarily desired was to see Poland restored in its ancient limits as prior to 1772, so as to form an independent and intermediate State between the three great monarchies. France was also resolutely opposed to the annexation of Saxony by Prussia, and the

defence of the interests of the King of Saxony was a vital part of Talleyrand's policy.

Out of such a tangle of conflicting claims it was only by compromise that a final adjustment could be achieved, and the Vienna Treaty was the result of the spirit of compromise which ultimately animated the deliberations of the Congress. By its provisions Russia was permitted to retain the lion's share of the Duchy of Warsaw, and the duchy was to be formed into a State 'enjoying a distinct administration,' and ruled by the Czar with the title of the King of Poland. As the price of this settlement, however, certain concessions had to be made. The Duchy of Posen was separated from the Duchy of Warsaw and restored to Prussia, which also gained a portion of Saxony. Austria received back the Galician districts which it had lost in 1809; while, partly to pacify Austria, partly to satisfy Great Britain and France—whose idea of a Poland restored to complete independence was very imperfectly realised by the arrangements whereby Warsaw was united to Russia—Cracow was also eliminated from the duchy, and, in the words of the treaty, 'the town with its territory was declared to be for ever a free, independent, and strictly neutral city, under the protection of Austria, Russia, and Prussia.'

Such in brief were the circumstances in which the ancient capital of Poland was admitted to membership in the family of nations. By rescuing Cracow from the fate which overtook all other Polish towns and territories, absorption into one or other of the surrounding Powers, and by infusing into the little town the breath of international personality, the Congress was paying a sort of homage to the memory of Poland, and was preserving a microscopic memorial of its former independence.

For the student of political types, Cracow in its character as a distinct international entity presents several curious and remarkable features. We may instance, in the first place, the Lilliputian proportions of the 'wee Free,' which are all the more noticeable because of the Brobdingnagian stature of its protectors. While it lasted the republic was something less than a small State, as that term is generally understood nowadays; it belonged to the category of pigmy States or 'international atoms,' as a learned publicist has called them, of which the modern international society only furnishes a very few specimens. Those which are still extant are the Principality of Monaco, the Republic of San Marino, the Principality of Liechtenstein, and, oddest perhaps of all, that tiny survival of medieval constructive ingenuity, the Republic of Andorra in the Pyrenees. Needless to say, by reason of their minute dimensions, these are all doomed internationally to complete insignificance and impotence, yet it can hardly be denied that they are to be ranked as members of the family of nations.

Attention may next be directed to the somewhat limited character of the independence or sovereignty which the republic was vouchsafed under the constitutional arrangements embodied in the Vienna Treaty. True, Cracow was, as we have seen, declared to be 'free and independent' without any apparent qualification. But the language of diplomatic documents must never be taken too seriously, and this admonition is especially applicable to the terms 'free' and 'independent.' The very same article of the treaty which gave Cracow its freedom also placed the town *under the protection* of its mighty neighbours, and therefore it only acquired such a measure of independence as is enjoyed by 'Protected States.' This species (the latest example of which is Egypt, now under Great Britain's protection) consists of States which have been taken under the wing of more powerful States, on the understanding that the latter shall to some extent at least be entrusted with the management of their affairs. Over its internal economy, indeed, Cracow was given a fairly ample measure of control. It had all the apparatus of government for domestic purposes: an Assembly of Representatives, a Senate, a judicial system, and a municipal militia for the police and safety of the interior. At the same time, even the internal autonomy of the republic scarcely appears to have been complete, such matters as the tolls on bridges and roads, and 'the principles concerning the currency,' being handed over to a commission which was partly appointed by the three protectors. It was, however, in the sphere of international relations that the limitations upon Cracow's independence were most marked. Indeed, there are no indications that the republic possessed, or was intended to possess, any power of directing its foreign policy according to its own will. No doubt it was felt at the Vienna Congress that such a diminutive commonwealth, hemmed in as it was by its protectors, was not in a position to have any foreign affairs of its own, at least beyond its dealings with the protectors themselves. The constitution is silent on the subject of the army, perhaps because it was felt that the neutral character imposed upon Cracow made the maintenance of forces beyond the municipal militia unnecessary, and there is no mention of a Foreign Office or of arrangements for diplomatic intercourse with other countries. Great Britain maintained a consul at Cracow, but apparently was never represented there by a ministerial resident.

But of all the peculiar features impressed upon the little republic at its creation none is more noteworthy than its 'neutralisation.' In declaring the city of Cracow to be for ever strictly neutral, the Treaty of Vienna brought into existence what international lawyers call a 'Neutralised State'—a category which has been attracting public attention since the outbreak of the war because it includes Belgium and Luxem-

burg. What is more, it may be legitimately claimed on behalf of Cracow that it was actually the first specimen of this kind; for though the neutralisation of Switzerland was dealt with at the Vienna Congress at an even earlier date than that of Cracow, still in the case of Switzerland the arrangements were not finally completed until the Treaty of Paris in November 1815.

The statesmen who in 1815 hit upon the idea of endowing certain States with 'perpetual neutrality,' and those who in later years adopted and applied the idea, were animated by a two-fold purpose. It seems to be beyond doubt that they were thinking first and foremost of the interests of the larger members of the family of nations, and that they designed the neutralised State to act as a 'buffer' between powerful neighbours which would lessen slightly their points of contact and attack. But it was also hoped—and, as we know now, vainly hoped—that neutralisation would prove a shield and buckler to the small States themselves who were subjected to the process. The guarantee of neutrality obtained from the Great Powers was expected to transform them from possible despoilers into permanent protectors, and the little ones would thus get a tolerable chance of preserving their territories and their liberties intact.

Neutralised Cracow invites comparison with neutralised Belgium. The neutralisation of the latter was effected by three treaties or 'scraps of paper,' as the Germans prefer to call them, signed on 19th April 1839, one between Holland and Belgium, one between the five Great Powers and Holland, and one between the five Great Powers and Belgium. Article VII. of the first-named treaty is in these terms: 'Belgium, within the limits specified previously, shall form an independent and perpetually neutral State. It shall be bound to observe such neutrality toward all other States.' This article is annexed to the other two treaties, and is declared to have the same force and validity as if it were textually inserted in them, and is thus placed under the guarantee of the five Powers. On the other hand, Cracow, unlike Belgium, was not itself a signatory of the document whereby it was neutralised, for the simple reason that this document was also its charter of independence, from which it derived its existence as a State. But as in Belgium's case, so in Cracow's, there was in reality a series of treaties. The erection of Cracow into a free neutral State was originally arranged by articles in three treaties between Russia and Austria, Russia and Prussia, and Austria, Prussia, and Russia, on 3rd May 1815. The articles relative to Cracow were afterwards embodied in the Vienna Treaty, and the three treaties themselves *in extenso* were annexed to that treaty and declared to be integral parts of the arrangements of the Vienna Congress.

It is further worthy of remark that no express

duty was laid upon Cracow, as it was upon Belgium, of observing neutrality towards all other States, probably because such a requirement was felt to be unnecessary in the circumstances of the Polish town. A *quid pro quo*, however, of a different kind was exacted from Cracow, for the Vienna Treaty expressly stipulated that 'no asylum was to be afforded in the town or its territory to fugitives, deserters, and persons under prosecution belonging to the country of any of the three protectors.'

It was this stipulation that ultimately led to the extinction of the little republic. The shadow of impending doom began to fall in 1830. During the Polish insurrection which broke out that year the streets of Cracow echoed to the tramp of Russian, Prussian, and Austrian soldiers. A military occupation was set up by the protectors, despite the solemn undertaking which they had given in the Vienna Treaty that they would respect the neutrality of Cracow, and that no armed force should ever be introduced into it upon any pretext whatever. On this occasion Great Britain did not raise its voice in protest, recognising apparently that the step taken by the protectors was in some measure justified by the exceptional crisis which confronted them. Six years later the troops were back again. Cracow, it was alleged, had, in violation of its obligation, become an asylum for all manner of undesirable refugees, and a hotbed of political intrigues and conspiracies which menaced the peace and order of its neighbours. This second occupation lasted for four years, and before the soldiers were withdrawn many changes had been made upon the republic's constitution, whereby, though the forms of freedom were preserved, the government was in reality transferred to the agents of the three Powers. These proceedings caused not a little indignation in this country. During the progress of the occupation the affairs of Cracow kept the House of Commons busy on more than one occasion, and there was much outspoken denunciation of the violent measures adopted against a State 'which formed an integral part of the great community of Europe,' and 'whose independence it was of as much importance that Great Britain should see was not causelessly or wantonly disturbed as if the case were that of Prussia or any other powerful nation.' Possibly the British attitude may have conduced to the termination of the occupation.

But the final catastrophe was not to be averted. In February 1846 an extensive conspiracy was organised in Posen and Galicia, and Cracow became the seat of a central authority calling itself the Revolutionary Government. In the

opinion of the three protectors these circumstances constituted a real state of war on the part of Cracow. The destruction of the republic's independence had long been in their contemplation, as is proved by a secret treaty which they had signed some years previously. Now at last their resolve took definite shape, and on 6th November 1846 they signed a convention declaring that Cracow was to be restored to Austria, and to be possessed by his Imperial and Royal Apostolic Majesty in the same manner as before 1809. The date of this treaty, then, may be taken as the day on which the State of Cracow gave up the ghost of its independence, and sank back to the level of an Austrian town.

Great Britain and France, as signatories of the Vienna Treaty, both addressed protests to the Austrian, Prussian, and Russian Courts; and in the dignified document which he signed on behalf of this country, Lord Palmerston contended that the three protectors could have secured their internal tranquillity without destroying the independence of the State of Cracow, and that their action was in violation of the Vienna Treaty. The ingenious argument advanced by the protectors that they had created the State of Cracow of themselves on 3rd May 1815, and that the stipulations relative thereto, which they had arranged together, had merely been presented at the Vienna Congress for registration, was met by the reminder that these stipulations had been solemnly declared to be part and parcel of the Vienna Treaty itself. But when the protests were presented all was over, and the curtain had rung down upon the epilogue of the tragedy of Poland.

And now the curtain has re-risen on a new drama far transcending in the magnitude of its interest anything presented in the eighteenth and nineteenth centuries, of which the *dénouement* has still to be disclosed. Once again, but with divided purpose, the troops of Russia, Prussia, and Austria are converging on Cracow, and the little city and its destinies have again become one of the salient topics of the hour. If Cracow holds out, and the Teutonic forces ultimately prevail, a long farewell to dreams of Polish liberty. But if Cracow falls, and the final victory rests with the Allies, the prediction may be hazarded—in view of Russia's promise, and of the formation of a Polish National Council at Warsaw to foster and direct the widespread yearning for reunion—that ancient wrongs will at last be redressed by the restoration, not of a free and independent Cracow, but of a free and independent Poland to the family of nations.

THE BRIGHT EYES OF DANGER.

By JOHN FOSTER, Author of *On Old Speyside*, *The Bernardine*, *The Ship of Shadows*, &c.

CHAPTER XIX.—AFTER PRESTON—IN COVER IN THE BRACKEN.

WITH the shutting of daylight dead silence fell. I finished my provender, and waited until I wearied. In an hour I was yawning my head off. Never a sound came from the watching camps. In another hour my head nodded, and the fates of nations concerned me not. I slept. Nor did I waken until early morning, when I found to my chagrin that the whole diagram of the landscape was blurred. A mist, thick as a blanket, chilling to the bone, had crept up from the sea, and, between its agency and the dark of the morning, I feared that I should see little of any fighting. But there is a use for everything, we are told, and the mist that day turned out to be the Pretender's chief ally.

Once, as the morning wore on, I thought I heard a few carbine-shots; but I could see nothing from my hollow, so I went boldly forward, and, finding a high sand-dune, climbed to its top. Here I fared somewhat better. In a lift of the mist one of the sun's early rays glinted for a moment on the long steel line of the English muskets. The grayness thinned as the sun struggled over the horizon; and my eyes, growing used to the half-light, picked out from the hazy outlines in front of the Royalist position what, at my first glance, I conceived to be a long hedge. I was trying to place it in my mental map of the arena, when I suddenly discovered that it was moving with all speed under cover of the mist. The 'hedge' was the rebel army. I had scarcely grasped the situation when half-a-dozen field-pieces were fired from the English right wing. The Highland advance hovered for a moment. The bark of the English field-pieces was followed by a great rattle of musketry from their infantry; and, almost as quick as I set it down here, the next thing I saw was the charge of the Highlanders.

There are scores of chronicles of the fight at Preston. If I differ from some of them, I am only recording what I saw. Whether it be that the mist favoured the Highlanders, that their attack was in the nature of a surprise, or whether their system of closing, getting hand-to-hand with dirk, claymore, and targe, was helped by the ground and the light, I cannot tell. The plain truth is that from the moment the Highlanders got to close quarters (and they charged with a valour that wrung admiration from me) the Royalist cavalry wheeled about like poltroons, and their infantry, robbed of support, wavered, broke, and either escaped, surrendered, or were cut down. It was not a battle. It was a rout; and I, an Englishman, think black shame to say so. The whole affair barely lasted five minutes.

But strange things happen in war. Though there are degrees of bravery, the man wholly without fear has yet to be born. Since that day I have learned much of men's conduct in the field. I have seen brave regiments mastered by reasonless panic; men, each of whom, if facing known odds single-handed, would scorn to give an inch of ground, yet in mass, seized by vague fears, broken and scattered like sheep.

I stood for a minute or two, amazed at the swift decision of affairs. There was a scurry of hoof-beats, cries wild and harsh, or of terror; a welter of flying men. Something hummed like a great vicious insect over my head. I ducked automatically. The stray bullet doubtless was never meant for me, but it briskened my wits. I was down the dune in a twinkling, and ran, never drawing breath until I reached the sand, where I slowed down to a walk, intending to make for Musselburgh and get my horse as soon as I judged myself safe from the notice of either the hunters or the quarry.

There were but few people on the sands, and all of them far out towards the sea. None were making for Edinburgh, for those of the Royalists who escaped made off eastward. Indeed, Cope himself was the first one who arrived at Berwick, and with such expedition that he was greeted by my Lord Mark Kerr with the caustic observation that he was the only General heard of who was the first to bring news of his own defeat!

I had gone but a little way along the sand when, to my surprise, I heard myself called by name, and in a little bight of sand that ran to a point in the dunes I beheld Walter Irving. I was mightily glad to see him. Two swords, like two heads, are better than one. Had I met any rebels, these gentry, flushed with their first victory, might have stood upon no ceremony. Besides, I was sorry for having shown temper with Walter, and wished to tell him so.

'I heard at the "White Horse" that ye cam' out to see the fight,' said he, 'and I hurried after with what speed I could; but I lost trace o' ye at Musselburgh, so I spent the night on the links. I'll warrant ye did the same,' he said, with a glance at my clothes.

'Indeed I did,' I answered; 'but I only saw one charge. The mist played an ill trick on me.'

'A waur trick on Johnnie Cope! There was but one charge from beginnin' to end. The hail business took less time than I have seen the watch clearin' a change-hoose.'

I sat down beside him, and we discussed the affair and its consequences. In a break in the talk he told me, a little shamefacedly, that he was sorry if he had presumed somewhat the other

night; but he had meant well, and hoped I would think no more of it.

I was just going to ask him to forget it, and I told him so. It was blithe, he said, to see my face and hear me speak as I did. 'Tis as good as a cordial,' quoth he; 'and, talkin' o' cordials, I feel as boss as a drum. Let us push on for Edinburgh and breakfast.'

I told him I purposed getting my horse at Musselburgh; and forthwith, in great amity, we took to the sands again. The sun marching steadily on his round was spilling molten silver over the sea, disengaging the islets on the Firth and the Fife hills from the morning banks. A finer day never broke, but I had no heart for it. Black shame at the rout of my countrymen, and the thought of brave men lying stark in the bright morning, kept me tongue-tied; and Walter was, for him, unusually silent.

We had come in sight of a curve of sand glittering like a yellow sickle in the distance, its farthest point joining a spit of rocks that rose gradually to a green-topped bastion. I was staring at it, a thought growing within me that brought the blood to my face.

My companion stopped suddenly. 'Where did ye say the house o' The Garth was?' he asked, laying a hand on my arm. 'Ye spoke about a wall o' rocks an' what not. Look! What say ye?'

My thought grew to a certainty.

'What say ye?' he repeated.

'The place itself, as I live!'

'Are ye armed?'

I showed him my pistol.

'I carry one too,' said he, whipping it out, his lethargy gone. 'If ye are in the mind, the twa o' us might take a keek at the place. Ye've whetted my curiosity. Lord, it looks quiet enough to be a—a graveyard!'

I needed no stimulus from him. Fate, it seemed to me, lurked beyond the dark shoulder of the rock. From where we had halted on the sands there was no sign of the gaunt house, but I knew that it lay in the dip below the brackens that crowned the little cliff. Hidden, voiceless, mysterious, the place beckoned me. A little stab of pain touched me when I remembered—did I ever forget them?—the word 'coward' and the curl on Mistress Charlotte's lip.

We went cautiously forward. Behind the rock we got a full view of the exit from the cave, the rock still plainly wet from high-water mark.

'Is that where ye escaped? 'Tis a risky jump,' he whispered, measuring it with his eye. 'But ye were lucky. Ye would have fared worse if ye had been caught!'

The words were barely out of his mouth when we both stopped dead. Somewhere a footstep sounded. Irving caught my wrist, and dropped silently to his knees under cover of the rock, pulling me down along with him. The footstep

came nearer, sounding above us on the path from the house along the little cliff. It paused for a moment. We exchanged glances and looked to our pistols. Another moment and it passed—the sound of a man walking lightly and rapidly along the path eastward and away from us. It died away, and without a word, on a common impulse, we rose, and, crouching, went quietly and swiftly up the path and peered through a screen of bracken. Some one, back towards us, was hastening along the path. I knew the slim figure at once. It was he whom I had seen welcomed by young Mistress Charlotte.

He looked back once towards the house, and kissed his hand gallantly. From my lair in the bracken I could not see the windows. But well I knew to whom the kiss was thrown. He was carrying a gun carelessly under his arm, went straight towards the spot on the cliff-top where I had first seen him clamber up, and lowered himself over it and out of sight.

'My lady has got a mate, then?' whispered Walter.

'Come, let us leave this place,' I said to him savagely, and would have risen had he not caught my wrist.

'Canny! Have ye lost your senses? Leave we will, and the sooner the better; but that house has eyes. We'll gang warily, and—nodding his head seaward—'we'll see what's happenin' over there first.'

We wriggled under cover to the little hollow in the cliff-top and peered over. The youth was crossing the sand towards the fringe of the sea. Straight opposite a little vessel swung lazily, her sail a dab of sepia on the bright sheen of the water. He stood still for a minute or two, and then put the gun to his shoulder and fired into the air. It was plainly a signal, for there was nothing for him to fire at, not even a sea-bird. I covered the vessel with my glass. A man in the stern rose and waved something white twice or thrice over his head in answer to him; whereupon he turned at once and came back towards us. We crept back into the bracken, and presently he came up over the rock and hurried along the path back towards the house. We gave him ten minutes, and followed; but not a sound or a sign of life came from The Garth. We lay hidden, watching for half-an-hour, when my companion made a sign, and we stole off stealthily through the bracken. Once in the wood we broke into a run and came back to our hollow at the cliff-top. Walter held his hand out for my glass, and spied the little ship steadily.

'No name!' he said; and as he spoke she was put about, and made off eastward down the Firth.

There was little use in our prowling longer around The Garth. The day was wearing on, and we were both tired and hungry.

The tide was at the flow, a barrier to our

getting across the gullet of the Cove; to make a détour round The Garth was to take needless risk of being seen; so we made our way across country southward at a round pace, and in an hour struck the post-road where a press of country-people was hurrying to the town. From behind us the wind still carried sounds of shouting.

I got my horse at the alehouse at Musselburgh, where we had a tankard and what not, and there they told us that Sir John Cope had lost a great number of men, all his baggage, and five thousand pounds in money.

We took the saddle in turn, and reached

Edinburgh in time to see Clan Cameron swinging into the town, pipes and drums exulting in the stirring quick-step, '*The King shall enjoy his ain again.*' I had marked their gallantry in the field; and now, elated beyond measure, they marched through the streets flaunting the colours of Sir John Cope's dragoons, captured in the fight. The pavements were thronged with gaping citizens. The air rang with shouts of the victors. '*Claymore! Claymore!*' came from a thousand throats; and never a Royalist, myself included, had a word to say.

It was high tide with the Chevalier.

(Continued on page 290.)

JUDGE LYNCH, THE ORIGINATOR OF LYNCH-LAW.

By A. G. BRADLEY.

UNDOUBTEDLY the two most conspicuous words contributed in modern times to the English language through the medium of a family name are 'lynch' and 'boycott.' It is, moreover, a coincidence that, though a century divided the individuals who acquired such fortuitous immortality, they were both Galway men by residence or extraction. Both, too, were comparatively obscure.

Captain Boycott, the Anglo-Irish land agent, found fame within easy memory merely as the first victim of a system of persecution that became a recognised weapon in the Irish land war. The name of Judge Lynch, a Galway settler in Virginia, was imprinted in the dictionary not a few years ago, like the other, but rather by a lingering tradition which, like many others, was distorted by time, and did not mature and take root in its present sinister form till long after the death of the supposed truculent American.

Charles Lynch, whose name is now synonymous with a barbarous contempt for the criminal law, was no wild, bloodthirsty Irishman, as even Americans often imagine, but a simple, God-fearing Quaker and worthy gentleman; a deservedly respected chairman of magistrates in Bedford, a back county of Virginia, before the Revolutionary war; and late in that struggle colonel of the local patriot regiment. Instead of a ruthless executioner of Tory partisans, as the vulgar tradition has it, Lynch was, on the contrary, a merciful and orderly soul.

Even in those violent times, when in the Carolinas and elsewhere 'Tories' and 'Patriots' were committing deplorable barbarities on each other, the record of Charles Lynch, Justice and colonel, was like that of the district which he controlled, free from anything of the kind. The Tories of the county, being in a minority, naturally engaged in schemes for reasserting the authority of the Crown. The leaders of one such enterprise, after a long trial, were sentenced by

Lynch to imprisonment: a relatively mild decree in the war-wracked state of the country and the fierce division of parties, and mild indeed compared with the doings elsewhere. This was in 1780, and the said Loyalists were fairly convicted of making war on the Commonwealth of Virginia, then threatened by Cornwallis's armies. The sentence was morally justified, beyond a doubt. They took their chances like either side in a civil war, and possibly thought themselves fortunate in getting off so cheaply. Technically, the prisoners should have been sent for trial to the higher court of the State; but Virginia then, under Jefferson, was quite disorganised by the Cornwallis peril and domestic dissensions, so Lynch and his court had no choice but to settle the matter themselves. After the war some of Lynch's opponents threatened a suit against him for what was technically an irregular proceeding. The State legislature, however, of which he was a burgess, took the matter up, and formally exonerated Lynch from all pains and penalties for such justifiable irregularities, at the same time complimenting him on his action at a time of imminent peril. But the mere fact that a State legislature had condoned such things at a crisis had no little effect upon the minds of rude frontiersmen in after years. The precedent was remembered by men very different from the law-abiding Quaker, and in situations having no resemblance to the War of Independence. As the rude frontier of civilisation pushed gradually westward, its pioneers, always prone to heady actions, justified many a high-handed deed and possibly many a brutal murder by quoting the irreproachable Lynch as an example, till the details of this particular case had been long forgotten, and his most worthy personality had become a symbol of infamy throughout the English-speaking world. Lynch's very obscurity, outside his little corner of America, has been his undoing, if indeed unmerited posthumous obloquy matters much to an obscure individual. Our famous

historical bogeys, King John, Richard the Third, Henry the Eighth, and all the rest of them, at any rate did much to earn their unenviable notoriety; but even they have had their white-washers. Poor innocent Lynch has, in a symbolical sense at least, grown more odious with the march of time, and never was more loudly and frequently invoked as a name of horror than in the present generation. He has no defenders, poor man, being nothing but a name once deservedly honoured, and so far as I know without living descendant. I wonder what he would think—or dare we say what does he think?—of it all. For my part, having in the long ago lived for years within sight of the scene of his labours, including that of the brief incident which made him famous, I have naturally taken a particular interest in this maligned revolutionary soldier. Fortunately he and his family have left a far worthier monument of themselves to posterity than that of adding a term of ill-omen to the dictionary. In short, they founded the nucleus of a now thriving city. Lynchburg, in Virginia, is not exactly a world-famous place, though in a sense it might be called so, for wherever Virginia tobacco is dealt in (and where is it not?) it is an outstanding name. For over half-a-century, indeed, it has been one of the best-known centres of the American tobacco trade. Now, comparatively few Irishmen outside Ulster emigrated to America in the eighteenth century. Lynch's father, however, being that paradoxically sounding product, a Galway Quaker, was shipped early in that epoch as an indentured servant to a Virginia planter. When free of his bonds he removed from the aristocratically administered eastern to the western and wilder portion of the colony, where poor men had a good chance of prospering, and, as in his and many other cases, of 'founding families.' He acquired land on the Upper James River, built a house, and started a ferry which by the time his sons were grown had become the nucleus of a town automatically bearing the family name, and with increasing importance changing it from Lynch's Ferry to Lynchburg. I know nothing of the first settler. The very site of his house had for long been obscured by streets in the days when I used to ride in there to buy supplies—dealing regularly, by the way, with the great-grandson of the Tory whose imprisonment has given immortality to the Lynches, and at the same time prevented him from actively serving the Crown and suffering expatriation like all those who did. None of the Lynches themselves, so far as I know, survived in my day, though as a Christian name theirs flourished in many local families who had been connected with them.

Charles Lynch, our hero, the son of the immigrant, like most Quakers, waxed and flourished. He was a prominent leader in the sect, and acquired lands of his own in the county, as well as slaves, his brother retaining the original

estate at the ferry, with its growing fortunes. This western county along the foot of the Alleghanias was not like the older and eastern half of Virginia. It had been settled through the first half of the eighteenth century mainly by Ulstermen, with an element of Germans, Quakers, and others who had fled from unfair legislation or personal persecution in their own countries. It was democratic, while eastern Virginia was aristocratic, and purely English in administration.

The two elements clashed in the colonial legislature, then elected by the vote of freeholders only. Lynch, who held a royal commission as colonel of his county militia (equivalent to our Lord Lieutenant), was a prominent supporter in the Lower House of the western democratic interests, though sufficiently conservative to oppose all extension of the franchise! The propinquity of the Indian frontier made the position in these parts a responsible one. But when Lynch accepted it he had to retire from the Quaker brotherhood, the bearing of arms being against their principles. But the pacificist, with all his virtues, was in a sense out of place on the western frontier in those old days, for the simple reason that he had to look to his neighbours for protection. To a man like Charles Lynch, this side of the family creed, when strong men were needed, no doubt appeared intolerable. Quakers were expelled from Anglican eastern Virginia in colonial times on both social and political grounds, so they found refuge among the hardy spirits of the frontier counties, mainly Presbyterians, Baptists, and Lutherans. Ulstermen or 'Scotch-Irish' were, however, the main support of this western frontier of colonial America, their scheme of life and the part they played in the making of the United States being the very antithesis of that of the Catholic Irish, who came later, and, crowding the cities of the East, have become the chief element in their notorious political degradation.

Lynch, though of Galway stock, had all the independent and strenuous qualities of the wilderness-conquering Scotch-Irishmen to whom every good American admits so vast a debt. All the Scotch-Irish then clustering thick along the western frontiers of the Atlantic States either fought for or sympathised with the American cause in the War of Independence. By ruinous trade laws and still worse discrimination against their Presbyterian creed, they had been driven from Ireland in thousands, bearing deep grudge against both the British Government and the Dublin Parliament, who shared equally the odium of having stripped Ireland of the cream of her people. It was a regiment of mounted riflemen, composed mainly of these people from his own district, that Lynch led in the southern campaign against Cornwallis. He fought in most of its battles, and was present with his eldest son by Washington's side at the final surrender at Yorktown. After the close of the war, Colonel

Lynch, according to the printed records of his county of Bedford, led a life of honourable utility both public and private till his universally lamented death in 1796. Such, in brief, is the true record of a man whose name, by a strange distortion of facts, stands in our language for a form of punishment that most of those who speak of it regard with loathing and horror.

It would almost seem as if this innocent wight were destined by some irony of fate to further and quite recent association with the particular crime for which he so unjustly stands sponsor; and I will conclude this paper with a brief relation of how this came about.

Now Lynch's own State, Virginia, had never in my day been as yet disfigured by any instance of lynch-law as now understood. In most of the other Southern States, however, it had been then, as now, a frequent occurrence, the victims being generally negroes; while in the West, as every one knows, it was a not uncommon substitute, rightly or wrongly, for legal methods that were feebly administered or ill provided for. But when at last a case of lynching did occur in old Virginia, it was the most singular one that probably ever occurred in the United States; and quite fortuitously, but actually, it took place in Judge Lynch's own county.

This was some twenty-five years ago, nearly a century after Lynch's death, when his name had become a mere perverted tradition; and, strange to say, the deed was done in defiance of the very county court over which in its infancy he had so long and honourably presided. As if to emphasise the coincidence, it may be noted that there are now nearly a hundred county courts in Virginia!

But if ever a lynching could be partially condoned, it was surely this one. The victim was not a negro or a poor white man, but the son of a gentleman and an ex-Confederate General, holding a respected position in the locality. This, indeed, is what makes the case unique in the whole savage record of rough justice. Furthermore, the authors of it were not rowdies, but quiet young farmers in a region which had never been even remotely concerned with such proceedings.

Now the aforesaid General was cursed with a worthless son who lived at home and showed little aptitude for anything but loafing around bar-rooms. Pistols were then frequently carried in the South, particularly by young men in country towns. Not that they were often used in Virginia, whose people were peaceable and sober folk; and when shooting did occur, it was usually stimulated by the heady atmosphere of the saloon. Still, the unfortunate tradition lingered that a serious quarrel, with insults, should be settled not by the comparatively honourable method of duelling, but by shooting a man at the first opportunity, after warning him of the intention. How an otherwise ex-

cellent and really peaceable people of English blood can have constructed such an un-English, vulgar, brutal way of settling a 'difficulty' in place of the duel, if fight they must, thousands have asked wonderingly and in vain. Anyway, the very few serious quarrels which occurred in Virginia were thus settled; for juries, intimidated or cajoled by personal influence, either refused to convict or passed mere trifling sentences on the murderers, for such in truth they were. The brutality and unfairness of these 'killings,' rare though they might be, together with their virtual condonation by judges and juries, caused the better-class people of a State which prided itself on gentility and domestic qualities to think that such a code was a disgrace; and it was high time. Two or three recent cases of acquittal or merely nominal sentence had caused them to think more furiously. But the course of the law and personal feeling were mixed up in the South, when persons of tolerable position were involved, to a degree inconceivable to Englishmen. There seemed really no cure, when, to the amazement of the public, lynch-law stepped in and gave the lax courts a warning which proved beyond doubt a most effective instrument for their reformation. The crime in question was an exceptionally gross one. This degenerate son of a worthy sire drew his pistol in quite a trifling altercation in a bar-room, and killed the other party to the dispute, a respectable young farmer. This was in Lynch's old county town, and the murderer was promptly locked up in the very jail that the famous judge had used a century before. Bail was refused, an unusual step in such affairs in those days, to the indignation of the murderer's friends and relatives. This was ominous, and the first hint that the public patience was exhausted. The usual methods, however, were set in motion. The prisoner's 'friends' at once busied themselves in working on the rather easily perverted sympathies of influential people. The General approached the leading physician of the town with the request that, as an old friend and neighbour, he would pronounce his son insane. He had come to the wrong man, however; for the doctor—who at that moment was mayor, and had fought under General Lee's eye throughout the war, and had been a personal friend of that great man—had ideas above the common ruck. He gave me an account of the interview, and I cannot set down here the emphatic reply he gave to this cool request to perjure himself for a worthless criminal because he happened to be a neighbour and socially a gentleman. The General was characteristically furious at this refusal, and warned the doctor to be armed the next time they met. The doctor, a laconic, fearless man, and a keen sportsman, said he reckoned he could shoot straighter and quicker than the other, which was undoubtedly true, and the matter ended.

But the impression gained ground, nevertheless, that another miscarriage of justice was at least probable. The victim's friends and neighbours, plain farmers living in a distant corner of the county, took counsel together and decided upon a course utterly unprecedented in that district.

Early on the following morning, before day-break, twenty young farmers rode rapidly down the quiet main street of the town, seized the keys of the jail, and carried the prisoner off into the country before any one realised what had happened. At sunrise the murderer was discovered hanging to an oak-tree bordering the highway a mile and a half from town. As the said tree belonged to me, and was within sight of my windows, I was not sorry to have been absent at the time of

this gruesome incident. Rightly or wrongly, the affair ended here. Rightly or wrongly, the better part of the community were thankful that the administrators of the criminal law of the country had received such a salutary lesson. No man of good social position had ever been lynched before or has been since in the Southern States.

[It is to be observed that while the derivation of the term 'lynch-law' given in the foregoing article is quite a probable one, others have been suggested, notably one which traces the term to Lynch's Creek, in South Carolina, which (to quote the New English Dictionary) 'is known to have been in 1768 a meeting-place of the "Regulators," a band of men whose professed object was to supply a want of regular administration of criminal justice in the Carolinas.']

THE RABBIT-WARREN.

By B. PAUL NEUMAN.

I.

TWENTY years ago, or more, there stood in Chancery Lane an old ramshackle building composed of several houses which had gradually been transformed into one. The result had been an extraordinary network of narrow passages and a surprising number of staircases. So complicated and tortuous was the place that it well deserved the name that was often given it—the Rabbit-Warren. In the Post-Office Directory it appeared as Bell Chambers.

In one of the crookedest corners of this ancient building, and approached by three flights of stairs, there was a door on which, if the day were exceptionally bright or the gaslight over the door were lit, you might read the name 'Mr H. M. Moore,' and under it, 'Mr George Crookshank.'

Mr H. M. Moore was an ancient barrister, a small, smooth-faced, white-haired old gentleman, with hardly any work except the composition of a monumental book on Real Property Law. He occupied the room nearest to the outer door. In the long, narrow clerks' room next to it was a folding bed, in which Mr Moore slept. Beyond this was a third room, occupied by Mr George Crookshank.

This young gentleman was in appearance a strong contrast to his landlord. He looked a good deal less than his twenty-five years, was of a pleasant, fresh complexion, with an engaging smile, regular features, and curly brown hair. His manner was at first a little shy and hesitant, but when fairly started he could talk to very good purpose. He was curiously alone in London. His father and mother were in India, and his only relation in England was an aunt who lived just outside Worcester, and with whom he generally spent his holidays. As to his abilities,

they were far above the average; but, both at school and afterwards at Cambridge, he had been careful not to injure his health by overwork, and his record was respectable rather than brilliant.

In due course he entered his name at the Inner Temple, took rooms in Bedford Place, and was called to the Bar.

Up to this time everything had gone smoothly for him; but a few weeks before his call he received a letter from India telling him of his father's break-down in health, and begging him to be as economical as possible. He was still reading in the chambers of a Chancery barrister, and he had been looking out for chambers of his own. He had fully intended taking a room in New Square; but now the cheapest must suffice, and he thought himself lucky to have found his room in the Rabbit-Warren at thirty pounds a year. He was of a sanguine temperament, and had little doubt that, somehow or other, briefs would find him out. In any case, the quiet of Bell Chambers would afford him the opportunity of reading hard and making up for those hours of ease the remembrance of which was beginning to worry him.

Two or three consent briefs and one or two 'cases' did trickle in from family friends, all of whom too obviously treated him and his opinions in the spirit of genteel comedy. The barrister with whom he had read sent him one or two drafts to 'devil' for him; but his second term was worse than his first, and the third than the second. And then Mr Moore intervened.

II.

It was on a sunny June morning that the old gentleman knocked at his door. Charlie, the

office-boy, was out, he said, and he had to go over to Fleet Street to see Baxter the publisher. Would Mr Crookshank kindly look after the chambers while he was out?

'Certainly,' George Crookshank answered; 'with pleasure.'

Instead of going, however, Mr Moore came inside and looked round with the benignant smile he usually wore. 'It's a pleasant room,' he said, blinking with his short-sighted eyes; 'the double windows make it different from other rooms, and so does the piano.'

George was able to assent heartily. The room was narrow, and had a window at each end. One window looked over a flagged yard on to a high dead wall. The other was only a few feet distant from the window of another room, probably part of the Warren, evidently a clerks' office. As for the piano, that had been a sore point with George ever since he took the room. Mr Moore had stipulated that it should remain there, as he had no room for it anywhere else, and he valued it, 'on sentimental grounds,' he said, with a strange little simper. George had not even the consolation of knowing whether it was kept in tune, for it was always locked. There was a music-stool with a drawer underneath the seat; but this was a very unobtrusive piece of furniture, and in a dark corner of the room excited no remark.

'Not very professional, I'm afraid,' remarked the young barrister, looking at the instrument.

The landlord still smiled. 'In these days a little eccentricity is a real help,' he said. 'Do you know much about copyholds?'

The change of subject was so sudden that George was a little taken aback.

'Not what *you'd* call much,' he answered. 'I had to look them up once or twice when I was with Weaver.'

'I wonder whether you'd verify some references for me? I've got the proof here of my chapter on copyholds. The cases I've marked are in reports that I haven't got. You go over to your Inn library sometimes, don't you? If you'd check the volumes and pages and summaries I'd be very grateful.'

George promised, and did the work at once; though it took him a good deal longer than he expected. Mr Moore was delighted, and joyfully accepted the young man's offer to do some more. From that time the relations between the two became much closer and more friendly. They were often in each other's rooms, and had long talks, in which, however, all the confidences were on George's side; it was only afterwards that it struck him how very reserved the old man had been.

The monumental work was to be in three volumes, and the first volume was now passing through the press. Day after day George went down to the library and made notes and corrections. At last, on the very eve of the long vacation, the final proof had been sent in; and, so far as vol. i. was concerned, the work was

finished. It was on a Monday that the last instalment was posted; and the same afternoon, about four o'clock, as George came back from the courts in wig and gown, Mr Moore followed him into his room. The young man noticed that he looked unlike his usual sleek, demure self. His cheeks were quite a violent pink, and his eyes shone bright behind his spectacles. His voice, too, was hardly recognisable.

'I've got a visitor,' Mr Moore said, 'a niece of mine that I've never seen before. We're having a cup of tea just now. Come in as you are. She's so anxious to see a barrister in all his glory, she says. Come along. Charlie can bring in a third cup.'

The old barrister seemed so anxious about what was, after all, a trifle that George, though he did not greatly relish the idea of being shown off to a well-preserved country spinster, felt it would be churlish to refuse. 'Certainly I will,' he answered. 'I'll bring the cup in myself. I must just send off a telegram.'

'Don't be long, there's a good fellow,' said Mr Moore, and shuffled along the passage to his own room.

Thither, in a minute or two, George Crookshank followed; and when he opened the door he could hardly believe his eyes, for, instead of the dowdy little country spinster he had pictured to himself, he saw, transforming the dingy room, the prettiest girl he had ever shaken hands with. So astonished was he, and so ashamed of his treasonable thoughts, that the ceremony was over, and Mr Moore's mumbled introduction too, before he recovered even a little self-control.

Then he heard Mr Moore asking, 'Well, Helena, what do you think of the uniform? Is it becoming, or the opposite?'

The girl looked up at George with laughing eyes. 'It's very picturesque,' she said. 'I can't imagine any one looking commonplace in it—or ignorant,' she added, as an afterthought.

'That's why some of us wear it,' George answered; 'I for one. But, if you don't mind, I think I'll be commonplace and comfortable.'

'Yes,' said Mr Moore, 'take them off; they're cumbersome things.'

So George threw his wig and gown on a pile of Bevan's Reports, and held out his cup to be filled by the stranger, who had drawn a dusty chair to the table, and sat with the tea-tray in front of her.

'And what do you think of London?' asked the old gentleman.

'At first,' answered the girl, 'I thought it was rather dreadful—so big and crowded and dirty. But I'm beginning to change my mind; and it makes a great difference having found one of my own kin. I don't feel so dreadfully alone.'

The old man stretched out his hand and laid it lightly on hers. 'Yes, my dear,' he said, 'it's a true saying, after all—"Blood is thicker than water."' Then he turned to George. 'This

young lady, Crookshank, comes from Australia. She is studying music.—The piano, I think you said?' he added, looking at her.

She nodded.

'We have an instrument in chambers, haven't we?' he went on. 'May we come into your room and have a look at it?'

These questions were addressed to George, who declared that nothing could give him greater pleasure. Indeed, the idea of seeing his room lit up by that bright, pretty face was very pleasant to him.

'It looks a little out of place,' she said when she saw the instrument, 'and you've put it in the corner like a naughty child; but it makes this room more human than the other. Do you play, Mr Crookshank?'

He shook his head solemnly. 'Lawyers never play,' he answered; 'with us it's all work.'

'That's why we're such dull boys,' said the old man with a soft chuckle. 'Try it, my dear. It was a great favourite with your aunt. I couldn't bear to part with it.'

She looked at the old man with a quick glance of sympathy that gave a new charm to her expressive face in George's eyes.

Mr Moore, after some fumbling, produced a small key and opened the piano. George brought up the stool and dusted the keys with a hat-pad.

'Not too loud, my dear,' said her uncle. 'It's rather early, and some of the neighbours might not like it.'

'They ought to be grateful,' said George, as, after a little nod and smile to the old man, she struck the notes with a firm but gentle touch.

The expression of Mr Moore's face became ecstatic. 'Ah, that lovely Chopin!' he exclaimed; 'your aunt used to play that, but she hadn't your touch; she'd have been the first to say so. Thank you, my dear. Only three minutes, but the purest bit of pleasure I've had for years. What do you think of the piano?'

'It's a bit out of tune,' she answered; 'but it has a lovely tone—lovely.'

'Do you think so? I'm so glad. It is yours, Helena—from your aunt; it is just what she would have wished. I felt it when you were playing. Take the key.'

The girl jumped up from the stool, put her hands on his shoulders—there was very little difference in their heights—and gave him a hearty kiss. 'Do you really mean it?' she exclaimed. 'Oh, thank you, uncle dear, a thousand times! But can you spare it? And won't Mr Crookshank miss it?'

'Mr Crookshank will be only too glad to be rid of it, stool and all,' he answered; 'and I shall like to think that it is being of use again. So we shall all three be pleased, which shows that it is an ideal arrangement.'

An hour later, when George was leaving chambers, Mr Moore opened his door and put

his head out. 'Can you spare a moment, Crookshank?' he asked.

'Certainly I can,' George answered. He secretly hoped that he might find the fair stranger still installed, but as soon as he stepped inside the room he saw that she was gone. The old man went back to his seat at the table, and George noticed that, instead of the usual reports and note-books, the writing-slope was covered with letters, envelopes, and one or two sheets of draft-paper.

With his back to the light, Mr Moore sat blinking at the tall, good-looking young man, and for a moment was silent. Then he said, with a curious, half-apologetic little smile, 'It's upsetting, isn't it, a sudden visit of this kind?'

'Rather a pleasant kind of upset, I should call it.'

'Ah yes, so it is, in a way. But, you see, you're young, and you don't know what it is to have a great, still past behind you, silent as the grave. That's a very just phrase, Crookshank; at least I thought it was, until this morning. And then, in a moment, to see it all leaping into life again! It's a very strange experience—bewildering.'

The old man passed his hand across his forehead and frowned as if in some great perplexity. Then he began again. 'Family quarrels are terrible things. This girl's mother was my favourite sister, and yet when she died we hadn't spoken or written to each other for twenty years or more. It was about her marriage. We all thought she was foolish and headstrong and obstinate; but I don't know—I really don't know. Seeing this girl has made me doubt; she's wonderfully like what her mother was. And then, when I married, my wife was all for peace, but I was very strong-willed. And now this girl is my only kin, so far as I know—the only close kin, at any rate; her father's married again, and she has some half brothers and sisters, but they are nothing to me. She's very pretty—almost beautiful, don't you think, Crookshank? And she played that Chopin just right; that brought back the past too.'

He looked down and remained silent so long that George felt embarrassed, and surreptitiously looked at his watch. The old man evidently noticed the action, for he raised his eyes, and, looking kindly at the young man, said, 'Good-night. I've kept you too long already. You see, I look upon you quite as a friend. You've been exceedingly kind and helpful to me, especially over the book, and I can assure you I'm not ungrateful. But, after all, blood is thicker than water, isn't it?'

And again he smiled that strange smile of apology.

III.

The next morning George Crookshank had a great shock. A case on which he had advised when in Mr Weaver's chambers was down for

hearing first on the list in Chancery Court II. Hence he came down unusually early. When he opened the outer door his first impression was of a crowd of people in Mr Moore's room, and one of the crowd was a policeman. As a matter of fact there were only four. Two of the faces were familiar. The caretaker of the Rabbit-Warren he knew, and Charlie, though the boy looked so scared as to be hardly recognisable. The policeman and a stranger were bending over the chair at the writing-table.

Mr Roota, the caretaker, came across and whispered, 'Poor old gent! The boy 'ere found 'im when 'e come this mornin'. 'E was frightened, and called one of our girls, and she the p'liceman, as I was out for a minute or two. I sent for Dr Paterson. But 'e's been gone hours, by the look of 'im.'

'The oil-lamp is still alight,' said George.

'Bless me! so it is.' No one had noticed it.

They laid the body on the bed, which was undisturbed, in the next room. Charlie and the doctor were sent off; and the policeman, after announcing that it was an 'inquest case,' also left.

'Now,' said George, 'we'll leave everything just as it is, and lock the door. Ah yes, here is the address I wanted, on this envelope. It is his niece; she came here yesterday. The excitement must have been too much for him.'

'The doctor said it was 'eart,' put in Roota.

'Well, I'll write at once to this lady,' said George.

The address was in Montague Place, a boarding-house, he guessed. On second thoughts he sent a telegram, 'Your uncle has had a seizure—serious, I fear,' and followed it by a letter. The telegram brought her about noon. George opened the door. The moment she saw his face her own fell.

'Ah!' she exclaimed, 'I was afraid it meant that. Is he really gone?'

'Didn't you get my letter?' he said, forgetting that it had been written only an hour or two before.

'No,' she answered, 'only your telegram. But I could see from your face.'

He took her into his room and told her all he knew. She went alone into the room where the old barrister was lying, and when she came back the tears were rolling down her cheeks.

'Now,' he said, 'can you look round in his room, and see whether there are any papers of importance?'

They went into the room together. The lamp was still burning dim and yellow. With a little shiver George turned it out.

'What are we to look for?' she asked, almost in a whisper.

'He told me last night that you were his only near relative. You ought to see whether he has left a will, and if so, who the executor is.'

'That might be it,' she said, pointing to a legal-looking document spread open on the slope.

By its side was a sheet of draft-paper, open, but without a word of writing on it. George gave a glance, then took up the first document and handed it to her silently. She read it—it was very short—and her cheeks flushed as she gave it back to him.

'It's for you to read. Did you know?' she asked.

'Having no near relatives,' he read, 'for whom I feel any obligation whatever to make provision, I give and bequeath all my property of whatever kind to my young friend George Crookshank absolutely in acknowledgment of the kindness and attention he has shown to an old man. If my work on real property is unfinished or unpublished at the time of my death, I hope he will arrange for its publication.'

The testator appointed Mr John Saxton, solicitor, of Bell Chambers, executor.

When he had finished reading the will the young man looked up, and consternation was plainly written on his face. 'I hadn't the least, not the faintest, remotest idea of such a thing,' he stammered:

She looked full at him, and his eyes were as clear and as honest as her own. 'You evidently hadn't,' she said; 'but, after all, it isn't so very extraordinary. He felt quite alone till you came and were kind to him.'

'It's absurd, ridiculous, preposterous!' he exclaimed. 'I did absolutely nothing but pay my rent and look out some references. Besides,' he went on, looking down at the table, 'it's quite clear what he was going to do. He had got out his old will because he wanted to make a new one. Look here; do you see this fresh sheet of draft-paper? He was taken before he could write it out, but it's just as clear as if he had put it down in black and white.'

'But that's his will at law,' she reminded him.

'Yes, at law,' he admitted; 'but nothing would make me take a penny under it. I understand now the last thing he said to me.' And he quoted all he could remember of Mr Moore's farewell speech, '"Blood is thicker than water." That's quite plain. He was going to put you in my place.'

She looked at him very kindly. 'I'm afraid you won't get on in the world,' she remarked.

'Because I don't want to behave like a thief?' he asked. 'I know what you would do.'

'Then you are clever, after all,' she exclaimed.

'I suppose we ought to find this executor, oughtn't we?'

'Yes,' he answered; 'I know the man. He's downstairs on the first floor. In any case, the piano would be yours. You'd like to have it at once, wouldn't you?'

'Yes, I think I would, if you're going to let me keep it. They said I might have one in my room where I am staying.'

'I'll see about that at once,' he declared. 'You shall have it to-morrow.'

IV.

In spite of Mr Saxton's scruples, the piano and stool were duly sent off to Montague Place the next day, and then a search was made to find out what property the old barrister had left. A schedule of investments, chiefly gold bonds, was discovered; but of the bonds themselves not a trace. There was a small current account at the Union Bank, but nothing was known of the securities.

'It looks as if the will doesn't much matter,' George Crookshank said to the girl. 'The cash at the bank will pay the funeral and law expenses, and the furniture may bring in anything from fifty to seventy pounds. I'm afraid that's about all you'll get.'

'You'll get, you mean,' she answered. 'You know it's yours, every penny of it.'

'I know whom he meant to have it, and I won't touch a penny of it; that's flat.'

'Neither will I, then; and that's flat too.'

They looked at each other and smiled—which showed that they were getting on. It was no wonder, for so many little points seemed to arise on which he had to consult her that they were always making appointments. She didn't like going to the Rabbit-Warren, and he didn't care about calling at the boarding-house, so they generally met on neutral ground—the British Museum, the National Gallery, or one of the Parks. There, after the point had been discussed, they usually had tea, and then walked toward Montague Place together.

'It will have to go to charity,' he declared.

'I dare say there's a Home for Decayed Barristers,' she said.

'Or a Musical Benevolent Fund. I shall be seeing Saxton on Monday,' he added as they said good-bye; 'if anything fresh crops up I'll drop you a line.'

Early on Monday morning, however, Charlie knocked at his door and announced, 'Miss Rivers.' He sprang up joyfully to meet her.

She was evidently excited, and when he held out his hand, instead of her own she gave him a long packet she was carrying. 'Look!' she exclaimed, 'what I found under the music in the music-stool!'

He opened the packet and found five gold bonds of American railways.

'The numbers on them in pencil indicate how many there are of each kind,' she explained. 'I didn't bring them all; they would have made such a big parcel.'

He made a rapid calculation.

'They must be worth at least eight thousand pounds,' he said; 'possibly a good deal more. I'm so glad they were in your music-stool!'

'Oh, that's an accident!' she answered. 'They belong to you, of course.'

'This time,' he remarked, 'there *can* be no doubt. He gave you the piano and the stool, and the stool evidently was his cash-box.'

'He would have taken them out if he had lived; there can be no doubt as to that,' she declared.

'I don't for a moment think he would. He was going to leave you everything by his new will.'

'That's only guess-work, and I feel quite sure it's wrong. I think he might have been going to leave me something—a hundred pounds perhaps.'

'That's funny,' he said. 'I was just thinking that he might have meant to leave me something like that. Suppose we each take a hundred and then settle about the rest.'

'It seems too much for the Decayed Barristers,' she remarked.

'Such a lump would only embarrass the Musical Benevolent, I'm afraid,' he sighed.

There was a pause.

'It seems to have had that effect on us already.'

Her voice was quite low, and he shot a quick, eager glance at her face, which was half turned away.

When he spoke again, it was with a curious little note of hesitancy.

'Suppose we make ourselves joint-trustees of the money?'

'Trustees?'

'Joint-trustees.' He laid a strong emphasis on the first word. 'For life, you know.'

He caught her hand. Her cheek flushed scarlet, but she made no effort to withdraw her hand.

'Then we shall have to go to one of your old judges, sha'n't we?'

She tried hard to keep her voice up to the ordinary business level; but, like her face, it betrayed her.

In a moment he drew her to him, and slipped the other arm round her waist. 'No, my dear,' he cried; 'any parson can do the job.'

NIGHT.

THE sun is setting. 'Gainst the western sky

A row of pines their purple crests uplift;

And, as their wind-tossed branches change and shift

Athwart the splendours that behind them lie,

Flash evermore faint messages of light

To the gray East; where, far off, lies the sea

Crooning herself to slumber. Silently,

Dusk claims the valley; but upon the height

The dusky green of woodland still is seen;

And the dulled gold of whin. Then swiftly, lo!

The mists, that hover o'er the river, lean

To meet the waiting night; and all is dark.

Yet faint within my heart, methinks, even now,

I hear, at Dawn, the carol of the lark.

MARY C. CHRISTIE.

Chambers's Journal

SEVENTH SERIES

SAVE THE SCRAPS!

By KATHARINE BURRILL.

IT is perhaps somewhat superfluous to remark that the nation is at war; though you do occasionally meet self-centred, unimaginative folk so immersed in their own petty concerns that the great things of life pass them by, and they do not 'heed the rumble of the distant drum.' As it happens, the drum is by no means so very distant, and with every rataplan comes a little nearer, bringing home to us a number of things that we never thought of before. If we have all been just a little too comfortable, the awakening is all the more rousing; and surely there is no doubt about our *now* being thoroughly awake, with every man (and woman) 'doing his bit.'

As a mosaic, with its gorgeous colours, beauty of design, and accurately fitting pieces, contains 'bits' of all shapes and sizes, so each man's achievement varies with his capabilities and opportunities; in the great mosaic of life none of the small pieces are to be despised.

A cookery-book may not seem a very epoch-making achievement, if our minds are fixed on Dreadnoughts and Zeppelins, and we are 'thinking in continents;' but a wise and sensible cookery-book, that will teach us food values and how to make the best use of our resources in war-time, is a valuable addition to the house-keeper's library.

The poet sings for us, and we are properly grateful for his inspiring song; the cook prepares our food, and it is no disparagement of poetry to say that if we are truly hungry a greater meed of praise and gratitude will go to a good cook! The novelist opens up for us new worlds; with him we range the forests of romance, or enjoy ourselves hugely at suburban garden-parties; he makes us laugh, he makes us cry, he makes us see with new eyes, and he makes us *think*. It would be impossible to estimate what we owe to the writers of novels. When the novelist condescends to cookery we feel we owe him a great deal. We do not know how Mr Ernest Oldmeadow, in his *Home Cookery in War-Time* (Grant Richards), has managed to gain such a wonderful knowledge of cooking, and yet write his charming and well-known novels. Like the accommodating piece of furniture that was 'a bed by night, a chest of drawers by day,' he also 'contrives a double debt to pay;' so perhaps he writes novels during the 'wee sma'

hours' of the night, and concocts his delicious stews (out of cheap bits of meat like 'skirt' of beef) and delightful soups during the day. At any time his cookery-book would be a joy, it is so unlike the usual cookery volume, that bids you 'take' every sort of viand and condiment and pot and pan that you do not possess! To-day, when we are all Mrs John Gilpin's sisters in frugality, his book is a real help. As the days go on, and the butter jumps up and the sugar goes—like the swing—'a little bit higher,' we will welcome all he says about simple *hors-d'œuvres* that fill up the gaps, and rejoice that he sees no necessity to have sticky, jammy sweets, or expensive confections of gelatine and cream with confetti trimmings. Mr Oldmeadow's description of a *pot-au-feu* makes you hungry to read it. Why do we ever have dried-up or greasy roasts when we *could* have those satisfying compounds of meat and vegetables, all stewed together in a nice, attractive casserole? If the war only teaches us to cook by stewing and simmering, so as to waste nothing, and to use every atom of left-over vegetable, and to show a little intelligence over the composition of our meals, we shall have learnt *one* good lesson, anyway.

It rather cheers my Scottish heart to find a certain similarity between our barley broths and thick hotch-potches and the soups Mr Oldmeadow recommends to our notice. A great many people, whose sole ideas of soup comprise a very ornate 'party' soup and a nasty, fatty, watery liquid called 'brown' (and it never *is* brown, but generally a dusty, slate-pencilish gray!), will never believe till they study his cookery what perfect soups can be made, and out of so little. No one is to be commiserated as poorly fed who has a good basin of soup and a 'chunk' of bread. In fact, a great many of the dishes we eat we should be very much better without; if stern necessity sends us to a one-course meal, it had better be an Oldmeadowian soup and slices of whole-meal bread. And, by the way, I suppose, we have all realised already how the staff of life lends himself to waste; what a fatal tendency he has to develop into hard crusts; how he turns from an honest loaf into sneaky little bits and ends, and wishes to make us believe that his true

home is the ash-bin. Since the war I should think there is hardly a household in the British Isles that has not studied the bread question, and become sceptical over the doubtful economy of leaving slices of bread to go stale, so that, heavily dressed in butter and sugar and sultanas, they may become bread-and-butter puddings. When the B.-and-B. pudding requires two threepenny eggs to give it a Squeers-like 'richness,' far from being cheap, it is a very expensive comestible indeed. In nothing can there be made a wise saving more effectually than in bread. If the teeth of the family are reasonably sound every one should be made to eat his crusts; otherwise he deserves the meal of chaff ordered by 'Mr F.'s aunt' for Arthur Clennam, when she thrust her crusts upon him, and ejaculated, 'He has a proud stomach, this chap. Give him a meal of chaff, I tell you. Let him eat up every morsel. Drat him! give him a meal of chaff!'

'Mr F.'s aunt' was a stern and uncompromising lady (we all know she 'hated a fool'); but when she wanted crusts eaten instead of wasted, and 'every morsel' of the chaff banquet consumed, she was indirectly on the right tack. It is always maddening to see food picked over and turned about, and left; at the present time it is positively criminal to leave an untidy plate. I believe that mysterious person 'Major Manners' is responsible for our not finishing up our helpings of food; but surely 'the Major' was only intended to have the remains of gravy! Certainly in war-time 'the Major,' like many other people, must go on short commons. Having successfully economised in bread, we can make another saving in milk, for milk is very often a fruitful source of much waste. The tiniest drop of milk is so often an addition to various dishes that there is surely no need to let any of it turn sour and be thrown out; even *sour*, the milk can be used for certain scones and cakes. Mr Oldmeadow has no mercy on cooks or housewives who waste milk and bread; and I do not think he has much time for those who are too lazy or too ignorant to take a little trouble. He is also very severe over those who resent washing-

up. He says—and quite rightly—to cook successfully you must not be too sparing of clean cups and bowls and spoons (especially spoons!), and all these needful implements and vessels must be washed and dried; the wise cook washes, dries, and puts away as she goes along.

Mr Oldmeadow points out to us the many joyful possibilities of rice and the various forms of macaroni, and what may be made of sago and tapioca without resorting to the usual British milk-pudding—a pie-dish full of milk—a handful of some farinaceous compound thrown in, and the result a mere question of the oven's temper and the cook's memory.

If *Home Cookery in War-Time* is purchased as a help in a time when purses are lighter and food-stuffs dearer, the surprising result will be that, though less is spent, the meals are infinitely better and full of a pleasing variety. The saving on the bread-book (I trust that wicked fraud the bread-and-butter pudding will be unmasked!) will enable the housewife to lay out a little on *hors-d'œuvres*, to the infinite joy of the elderly and intelligent; less expenditure on indigestible and sugary puddings will allow far more money for fresh, wholesome fruit; a little careful planning will mean a better dietary all round.

Perhaps in the future we may look back to the war year as the year in which we all learned to save and be sensible, as the year when we were taught how to prepare the *pot-au-feu* to hold Henri the Fourth's Sunday fowl! When the eighteenth century toasts were going round, we remember it was not only 'the maiden of bashful fifteen' and 'the widow of fifty' who had glasses raised in their honour; there was also a toast 'to the housewife that's thrifty!' Could we have a much better 'cause for a glass' than a desire to 'drink to the lass' who is looking well to the ways of her household? Wise is the matron and wise the maid who, looking wistfully upwards to hail the palms of victory, yet tends the plants in the cabbage-patch, not forgetting that most useful little shrub, the pink-flowered thrift!

THE BRIGHT EYES OF DANGER.

CHAPTER XX.—THE PROWLER.

NEXT day came the affair of the red-haired man. Had it not been for his flaming shock of hair, that caught the eye at once, I doubt if I should ever have noticed him. Beyond his ludicrous thatch there was nothing to remark on his appearance, except its meanness. He was a short, squat, ill-favoured-looking underling, hovering about the 'White Horse' courtyard, apparently an obvious lounge. Once I had seen him grooming a horse (very leisurely, I thought), and had put him down

as a hanger-on—a seeker of odd jobs—at the inn.

Perhaps my lawyer friend's warning to keep a lookout for knaves made me notice him; but if I chanced to go to my window the man was sure to be about; and, as the day wore on, it seemed to me that he positively haunted the place.

I had a much-needed rest in the afternoon; and when I awoke towards evening, and looked out, there he was again, sitting on a stable trough, pipe in jaw, doing nothing, bone-idle;

a stale eye occasionally lifted to the inn windows. In a world that gives nothing for nothing, it is always an interesting speculation how a man can live without means and without working. I almost felt vaguely inquisitive about him.

I met him in the courtyard once or twice, when he stood aside to let me pass civilly enough, barely letting a shifty eye rest on me. Nothing was known of him at the inn beyond that he gave the name of Kay, that he was a Highlander, and that he occupied a room over the stables. What actively roused my curiosity, if not my suspicions, was my meeting him suddenly later in the day on the stair. He had come up so quietly that he nearly walked into me as I stood round the corner of the staircase. Plainly startled, he turned incontinently on his heel, with a mutter in his throat.

Now, if the creature was watching me there was something evil afoot, something lurking in shadows, afraid of the light. My thoughts put a thousand shapes to it, until my nerves were taut, for it is one matter to face the machinations of an enemy, but another to be obsessed by an unknown, unseen foe. I determined to make short work of the situation, keep my wits on the alert, and watch the watcher. I had little doubt Master Prowler (as I had christened him) would be loafing about. Sure enough, he was on the other side of the street when I went to the door! I had put on hat and coat as if I intended to go some distance, and walked smartly until I turned the corner. Once round, I ran at top speed down a wynd that led me by a crooked way to a side-door of the 'White Horse.' Dashing upstairs, I peered cautiously under a valance by a window that took in the breadth of the courtyard. Presently my man appeared, a wary eye raking the neighbourhood. He paced up and down, a puzzled frown settling on his face, and then sauntered out of sight in the direction of the back-door. Plainly he thought that he had missed me, and a quick thought came to me that my absence was perhaps what he sought. On the instant I went to my own room, locked the door, and, taking the key out, waited.

Night was on the threshold, a night of gusty wind and hurrying clouds, a night that promised to fall dark and starless. I lit no candle, and in about ten minutes a light and stealthy footstep sounded on the stair, stopping suddenly at the end of the passage. Very quietly I bent down, pistol in hand, and put my eye to the keyhole. It was my man; and, if I can read a human face, he was on the prowl. He held a candle in one hand, sheltering it from the draught with the other, and stood listening intently. Apparently he satisfied himself, for he tiptoed to my door, so near that I could see the buttons of his coat and hear his guarded breathing. He knocked very gently, waited for a minute, and knocked again lightly. His hand clasped the handle of the door, and began to turn it cautiously. I

had him wholly at an advantage so far as light went, for his candle picked him clearly out to me, and my room was in darkness. He knelt down. Holding my breath, the key in my hand, I waited until I thought his eye had found the keyhole. Then, filling my lungs, I suddenly bawled through the keyhole, '*Bungler!*' slipped the key into the lock, and flung the door wide open. It was done in a twinkling. He had not even time to rise, but stared up at me with a smothered yell of terror, the candle shaking in his hand. I got between him and the passage.

'Inside!' I pointed to the room. He obeyed like a dog, and I locked the door behind us.

'If you raise a hand I give you my word I shall wing you,' I said. I had covered him, and there he stood, his throat gulping, his face the colour of paper, beads of sweat on his face, his eyes travelling from mine to the pistol. 'You understand?'

He gave an inarticulate gasp, and nodded.

'Now, my friend, how came you here? Who sent you to watch me, and what do you want?'

He had difficulty in speaking, but contrived to tell me, in a marked Highland accent, that he was a poor man, that there was no harm in him towards me; but I cut him short, asking him his name.

'Duncan Kay,' he said, 'and it iss out of Speyside I am.'

'I think you are a liar; but go on. What do you want?'

'I wass seekin' Mr Layton from England. It iss a message that I have for him.'

'You have been watching me. Why?'

'I could not pe sure that it wass yourself, sir, and I did not wish to break speech with you in the street. There iss other folk might pe watchin' too. I carry a letter.'

He fumbled in his coat, and produced a sealed letter. 'It iss from my mistress.'

At these wholly unexpected words I laid down the pistol (to his manifest relief), and looked him squarely in the eye. He looked back stolidly at me, but a sudden suspicion leaped in me. I threw as much indifference into my voice as I could muster, and, taking the billet from him, said, 'Ah! When did she send you with this?'

'This forenoon, at The Garth.'

Here was a lie. I had difficulty in keeping myself from kicking him downstairs. He had been prowling round the 'White Horse' all day, and could not have been near The Garth. Masking my anger, I nodded carelessly with a 'So!' and broke the seal of the letter.

The handwriting was a woman's, small and clear, though hurried. It ran: 'I beg Mr Layton to keep away from this house of The Garth for the present. To set down more here would be unwise; but if he will send by word of mouth a reply by the messenger, saying whether he will still be at the "White Horse" in the Canongate in two days from now, Mr

L. (if he wishes to do me a service) will receive another letter from me by the same hand, and one that will redd up much, and may keep skaith from him and the writer. This is written in great haste. I beg the favour of an instant reply.—C. M.’

This was all, but it sent my thoughts off at racing speed, and keeping any excitement out of my voice, I asked him, ‘When did you first go to The Garth?’

‘It was yesterday only, sir,’ said he, and the whine in his voice did not lessen my instinct to go warily. ‘I came with some Speyside men to join the Prince, and carried letters to my mistress from the North.’

The rascal had told me one lie already. Whether this was another I could not tell. Liar or merely fool, I would watch him. Cunning should meet cunning. A man cannot always choose his weapons.

I sat me down and wrote a pretence of an answer. As the man’s intelligence seemed limited—in case I had made a mistake and the letter was a genuine one—I did not care to trust him with a verbal message. The gist of my reply was that Mistress Charlotte Macdonell’s wish was a command, and that I would remain in Edinburgh at her service. The note was not to my mind; but I dared not say more, and, after much revision and recasting of it, I sealed it and gave it to Master Prowler.

‘Hand your mistress this reply immediately,’ I said. I counselled him to take a good look at me, so that the next time he had a message to deliver he need not be under the necessity of tracking me through the streets or peering through keyholes; and, giving him a sixpence, I bade him be gone.

I listened to his step on the stair, and then, clapping on my hat, I slipped quietly out by the side-door into the street, and from a dark corner watched for his appearance. He came out by the front-door, without looking behind him, walking so swiftly that I was hard put to to keep him in sight.

It was now dark. There were crowds of people afoot, and many revellers. Huzzas from the Jacobites, drunken snatches of songs, and a great clatter of voices came from the change-houses. The streets were full of people, many of them reeling, for the Jacobites had been celebrating their victory, and discipline was worse than loose.

I mingled with the crowd, but never lost sight of my quarry. Presently he slackened his pace and turned down a side-street, and there, opposite a high ‘land,’ he came to a stand. I heard a low whistle; on its heels an answering one, and a tall figure of a man, well muffled up, joined him. I crept as near as I could, to about twenty paces from them, well in the shadow of the houses opposite. The red-haired one handed the taller man something, and the two heads were

soon close together. I could hear their hoarse whispers, but could catch no word except one; but it set a seal on my suspicions, for the word was ‘Garth.’ They crossed the wynd where a window threw a yellow patch on the darkness, and bent their heads over something. A faint little chuckle reached me. I had an odd sensation of having heard it before, and was wondering where, when the tall man, tossing a hand up, sent a flutter of scraps of paper into the air. The little white arc capered in the window’s light for an instant, and broke into a shower at their feet. The tall man looked up and down the wynd, and with a curt nod as of command, he turned away and went swiftly down the slope. The other waited until his companion went out of sight, and then came across the street towards me.

To remain standing, or to leave where I was, meant my being seen by him. In a second I slipped to the ground and lay huddled, to all appearance one of the town’s revellers sleeping off his potations.

The knave came past me, close enough to kick me had he cared to, but went on his way without as much as a hint of hesitation in his step.

I lay still until the footsteps had died away, and then slowly got up and lurched down the wynd, to all appearance as fuddled as any drouth in the city. The yellow patch of light marked the spot where the two men had stood, and scattered on the ground were about a dozen little scraps of paper. I had them in my pocket in a trice, made my way up the slope, joined the crowd on the street, and made straight for the ‘White Horse.’ There I locked myself in my room, lit a candle, and held the scraps of paper towards it. The writing on them was my own! They were the pieces of the letter to Mistress Charlotte that I had written not half-an-hour before! I sat staring at them, blackness and anger on my spirit. Here was treachery revealed; but, amidst my fury at the discovery, a thought froze me, a thought that for the moment struck all others dead. I took out her letter and read it again. Had she—could she have sent it, phrasing it deliberately to lure me into danger? Perhaps those in league with her were at this moment ripening their scheme, laughing, no doubt, at the poor fool Edmund Layton. The affair wrought an actual physical weakness in me. I came nearer self-pity than I have ever been. Things had come to a parlous pass when a Layton sat, head in hand, with a swelling heart, staring at a girl’s letter. And yet—and yet—there was honour and tenderness in her heart, or, I told myself, these virtues were not in this world. Why had the man Duncan Kay gone straight to a secret meeting, and given my letter to the other man? Why had I been shadowed? Question after question chased each other, until my wits were fairly at a standstill. Was I beaten? I could see no farther into the

shadows. True, there was one way out of it: the advice given by my lawyer and by Walter Irving, 'Saddle for Westmorland.' But I was a long way past considering that way out of the affair, or indeed any way except one. Westmorland would never see me until I had gone to the root of affairs.

The mystery of it all, the thought of the paltry attempt to fool me, maddened me. Had I been an older man, or one with a cooler head, I suppose I would have slept over my decision, and this tale would not have been written; but I was past hesitation. The letter I

had received asked—nay, begged—me to remain where I was. On the spot, I determined to take the diametrically opposite course—namely, to go back there and then, and find out for myself, if I could, what business was afoot at The Garth.

I wrote a letter to Mr Peter Scott. I did not tell him of my design, but merely said that I was going out of Edinburgh, and enclosed a letter to be opened by him if I did not call for him by Wednesday morning.

Much might happen in three days.

(Continued on page 306).

WAR BENEATH THE WAVES.

SUBMARINE MINES.

By W. O. HORSNAILL, A.M.I.Mech.E., A.M.I.E.E.

FLOATING mines in the form of barrels filled with gunpowder were used in the Crimean war and in the American Civil War, but with little effect, owing to the ease with which objects on the surface could be seen and avoided, and the uncertain action of the firing devices then available. The genuine submarine mine was first used by the Germans to protect their coasts and harbours during the Franco-Prussian war, and mines have served a similar purpose in every war since that time; but it was not until the struggle between Russia and Japan that 'contact' mines were sown broadcast on the open sea.

There are two kinds of submarine mines—namely, the 'observation' mine, which is fired by an observer on shore, and used mainly for the defence of harbours; and the 'contact' mine, which is self-contained, and explodes when bumped into by a ship.

Both sorts of mines consist of a steel watertight case containing a charge of gun-cotton or some other explosive, the devices for exploding it, and a block of iron or concrete, known as a sinker, to which the mine is moored by a wire rope. Mines are mostly spherical in shape, with a diameter of three to four feet; and they are provided with watertight lids, fixed on with screws, for giving access to the inside.

Observation mines are laid down in the entrance-channels to harbours, and they are connected by electric cables to a station on shore, where the officer on watch can explode any mine by pressing a button. This officer has a map or chart of the harbour in front of him, on which are marked the positions of the mines by distinguishing numbers. If the channel is a narrow one, single mines in the middle at intervals are sufficient to afford protection; but in a wide channel the mines must be laid in rows across it, otherwise a hostile vessel might creep through at one side without being seriously damaged by a mine in the middle. The mines in each row for wide channels are exploded together, owing to the

difficulty of finding out the exact position of an approaching vessel. The rows of mines in such a case are laid in line with the observation station, where instruments are fixed to indicate their position. It is, therefore, quite easy to tell when a vessel is over a row of mines, but it is much more difficult to ascertain her position along the row; hence the plan of exploding the entire row at once.

This type of observation mine lies at the bottom of the channel, or is moored to a sinker at a sufficient depth to clear all friendly ships passing through. The electric cable connecting the mines to the shore is similar to that used for submarine telegraphy, which consists of a copper wire core surrounded by gutta-percha and sheathed with steel wire, the latter forming a protection from damage, while at the same time giving great strength. This cable is used for mooring the mines to their sinkers in place of the wire rope needed for contact mines, which have no electrical connection with the shore.

The chances of getting a hostile vessel exactly over an observation mine are remote, and she may even be half-way between two mines. This feature, together with the depth of water, demands a heavy charge of explosive if serious damage is to result, and observation mines carry anything between five and fifteen hundredweight of gun-cotton.

The advantage of observation mines is that they do not obstruct friendly traffic; but this form of mine offers no protection during fogs, when vessels attempting to navigate the mined channel cannot be seen. To overcome this drawback, small spheres containing the electrical contacts are moored to the observation mines, and float above them near the surface, where they may be struck by passing vessels, a blow from a ship completing the electric circuit from the shore and exploding the mine. This arrangement is known as the 'circuit closer' system, and is really a combination of the contact mine with

the observation mine; but it will be noted that electricity is still supplied from the shore; hence such mines can be rendered harmless by switching off the current, and they can also be exploded from the observation station independently of the contact devices. No obstruction to traffic is caused by this system, as the electric supply is turned off for friendly ships, and the contact spheres are not large enough to be damaged by vessels bumping into them. The circuit closers simply act without any effect on the mines, and reset themselves. In a fog the electric current is left on, so that any vessel running into the circuit closers will be blown up although she may not be seen from the shore.

Sometimes a wide estuary is sown with observation contact mines of this type along each side, leaving a narrow channel in the middle protected by ordinary observation mines.

The ordinary contact mine suitable for sowing on the open sea is exploded by electricity when struck by a passing ship; but instead of having electric current laid on from the shore, a supply is obtained from a battery in the mine itself. Contact mines are, therefore, quite out of control once they are laid; and if they are sown in waters used by the ships of all nations, friend and foe are alike blown up.

Naturally, *floating* mines would be practically useless, as they could be easily seen and avoided, searchlights being operated to show them at night. Contact mines are, therefore, weighted to float at a depth of nine to ten feet below the surface, where they will be hit by any warship larger than a destroyer.

The acid for the batteries inside the mines is carried in separate chambers, and only allowed to flow into the cells just as the mines are being laid; consequently no electric current is available for exploding the gun-cotton until the mines are in the water. The actual contact which completes the electric circuit and explodes the charge is generally made by a pendulum when the mine receives a violent blow.

As contact mines are touching the ship when they blow up, very much smaller charges of explosive are effective than is the case with observation mines, and these charges generally vary between seventy-five pounds and two hundredweight. The size of the German mines which have drifted ashore, however, appears to

indicate that their practice is to use a much greater weight of explosive.

Mines are laid by vessels specially built for this purpose, or by old cruisers which have been fitted with racks and laying-gear. A mine-layer carries from three to four hundred mines on rails or racks along the sides, these racks being curved downward at the stern, where the mines are slid over into the water.

The sinkers are ready under the mines with mooring-ropes of the right length to suit the depth of water. By these means a large number of mines can be quickly laid over a wide area.

Such contact mines as have not exploded during a war must be taken up after hostilities are over, or they will form a continual source of danger to shipping; also, where mines have been sown on the high sea, the nation against whom they are aimed naturally wishes to remove them with the least possible delay. The operation of taking up mines is known as 'mine-sweeping,' and it is carried out by vessels in pairs with a wire rope between the two, which is dragged along the bottom. The mine-sweeping ships are from two to three hundred yards apart, and to keep the wire rope down iron sinkers are hung on at each vessel and lowered down the rope by a separate cable, thus keeping it on the bottom at each end. As the mine-moorings are caught some of the mines knock against each other and so explode, but usually they have to be hauled to the surface by shortening and tightening the wire rope after the sinkers have been pulled up. Once on the surface, the mines are shot at and exploded by light guns.

Fishing-trawlers of about one hundred and fifty tons are used for this work, which is decidedly risky. The bottoms of these craft when light—that is, without a load of fish—only go down about six or seven feet into the water, so they easily pass over the mines without touching them.

The gun-cotton used for mines and torpedoes is in the form of compressed slabs, which are so hard that they can be planed, sawn, or drilled like pieces of wood. A charge is built up of a large number of these slabs, which contain a considerable percentage of water to render them safe for handling. The firing is started by an electric spark which explodes a detonator of fulminate of mercury in connection with a primer of gun-cotton, which sends off the main charge.

A BAYARD OF THE BUSH.

CHAPTER II.

SHE saw a long, low board-house with a corrugated iron roof, surrounded by a wide veranda, the whole raised on short piles. Out-houses of rough unbarked logs, and great galvanised iron tanks, ribbed and steely, loomed in the background.

A certain order was lent to the irregular group of buildings, cast immediately in the surrounding desert of dry grass, by the marshalled lines stretching to right and left of the plantation.

The blossom of the almond, just shed, whitened the ground about them like lightly fallen snow.

A regiment of lemon-trees stood yellow against the clear blue of the sky. A yet larger plantation of apricots filled the background; between them and the almonds were some acres of dwarf vines, just now pruned to mere stumps. A rough circular pond, which the man Al had referred to as a tank, lay in the foreground.

It had been a selection taken up in the old days, when, for a shilling an acre and the additional necessity to improve the land up to another shilling the acre, man began the work of cultivating Australia. After twenty years the land became the selector's property. For the first six years it could not be leased; the selector must either live on it or within five miles of it. It had long passed beyond those early limitations when Mortimer Chesney bought it.

'Home!'

She tried to feel stirred. Lately she had sometimes said the word to herself, trying shyly to focus its meaning, just as she had even more shyly said the word husband. Now, without any definite sense of thrilled emotion, she faced the one, and was about to be projected into the presence of the other.

She was conscious only of feeling rather sick. A shout from the man Al of 'Jamieson!' produced a servitor in a flannel shirt, braced trousers, and a flop-hat, who slouched up negligently and took possession of the horses and buggy.

'Now, Mrs Chesney, you come right along!' said Al.

She followed his easy, lissome figure on to the veranda, and along it towards a half-open door. She paused helplessly on the threshold. Momentarily a silly desire to keep the man Al between her and Mortimer Chesney during the pending interview assailed her.

'Go right in,' he said encouragingly.—'Here you are, boss!' he called. 'Here's the missus!'

Stumbling awkwardly over an unsuspected step, she became aware of a bare room, with board walls which seemed to be closing in upon her.

A rough dog came slowly forward, bristling and growling.

On a plain narrow iron bed lay the long outline of Mortimer Chesney. His tired voice met her hesitation, 'Will you come round to this side? I cannot turn.'

Chilled and remote, her brain took in with unnatural clearness the details of the moment, but it refused to guide her action. What ought she to do? Bend down and touch that pallid, unshaven face? Her lips had never yet met his. She couldn't. It was impossible.

He had, for coolness, pushed back the coverings, and her glance fell abashed before the bare lines of his strong throat.

'I—I'm so sorry,' she faltered, standing well away from the bed, her eyes unconsciously dilated and fearful. He seemed to her at that moment a complete stranger. 'You have been hurt?' she added weakly.

He held out his hand.

The room was insufferably hot. A drone of buzzing flies blundering about the window and bumping their bodies against the ceiling sounded a dreary monotone. A battered palm-leaf fan lay on the quilt, and a glass of some dull-gray fluid—barley-water she learnt later—stood on a chest beside the bed.

She laid her gloved hand lightly in his for a moment, an evanescent touch which slipped from the grasp with which he essayed to detain it.

'Yes,' he assented, 'I have been hurt.'

His eyes, above the stubble of many days' growth, looked her quietly over. She felt that his appraising glance took in the quality of her appearance, and found in its fineness something disappointing, alien, and forbidding. Removed from the setting the Ingrams had created about her, she realised that he was seeing her afresh, and perhaps putting to himself the question which throbbed in her own ears: 'Why did I do it?'

After a little further talk between them, a civil, meaningless exchange of nothings, he dismissed her with a certain gravity, as if there had fallen upon him some devastating certitude confirming a doubt which, however forlorn it left his hopes, must be met with the manners of their kind.

In a bewilderment of pain, Jan passed from his room on to the veranda.

A coarse-looking girl, in a bright-blue blouse, her hair piled in numerous cylindrical rolls, handling curiously a coat Jan had left in the buggy, nodded affably. 'How do you do, Mrs Chesney?' she said familiarly.

Jan passed her without a glance, pressing blindly towards the man Al lounging against a veranda-post.

'What must I do?' she asked, her white face appealing unconsciously for guidance in some deeper necessity than the mere desire to be shown her room.

'You come along, Mrs Chesney,' he said cheerily; adding authoritatively to the girl in the blue blouse, 'Now then, Irene Smithson, you go and start that supper as quick as you can streak.—Real sensible of you not to stay long, first go off, with Mort,' he went on, leading Jan in the direction of her room. 'If you haven't had much truck with sick men, Mrs Chesney, you're going to get a new view of Mort quick and lively. Doc Robertson was out from the township yesterday, and says he's getting on real smart. He'll be up and about before you can say knife. Kind of unfortunate its happening so just at this time.'

He stood aside to let her pass into a bedroom which showed primitive efforts at decorative arrangement, revealed in a buoyant dressing-table draped with pink-glazed calico and spotted muslin, and stiff lace curtains at the window tied about the middle with bright-pink bows. Running the whole length of one of the plain

board walls was a beautiful wardrobe of Australian gidea-wood.

'Like it?' asked Al, standing interestedly on the threshold, with a hand on either jamb of the doorway. 'It's taken a bit of doing. Tying those pink bows was the worst job I ever struck, and getting that contraption of a wardrobe from Wangabool and setting it up took the best part of a week. The boss chose it in Melbourne. There ought to have been the whole caboodle—dressing-table, washstand, and so on, to match; but that's like Mort. He doesn't take in more than one thing at a time; though he's a dead nailer on its being the right thing of its kind as far as it goes. Now you want to get off your hat and give your hair a bit of a fluff up before supper. It will be along in a brace of shakes. I'll jog the Smithson girl to get a move on.'

Miss Irene Smithson, standing over a wood fire in an iron stove gray for want of blacklead, met Al's adjuration to 'get a move on' by a thoughtful continuance of her occupation of frying chops, which spat and frizzled beneath her ministrations, emitting a powerful odour of burning tallow.

'I reckon that's style!' she said, jerking her head in indication of Jan's room. 'She ain't like any woman I ever set eyes on, though I've seen a many prettier; and that high-handed way, not so much as a word flung to a dog! English, I should suppose. Hasn't taken my fancy, I must say!' Miss Smithson delicately touched the rolls surmounting her eyebrows. 'She don't do her hair much. But that coat! for all it's so rough seeming, it's lined sheer solid silk through and through.'

'Just bale that pan a bit off the fire, my girl!' said Al, with irritation. 'You're given to serving cinders instead of chops.'

He went on to the little room at the back which was his. 'There's too much sheer solid silk about this set-out,' he observed to himself. 'Mort's gone and made one of his blind, bad blunders, that's sure. Reckon he's struck a snag round this bend of his flowing river. One of the broody, sensitive sort she is, skeered to death of me, and the old buggy, and the scrub, and the whole look of things, including the boss. No wonder Mort's been about as lively as his own funeral since he came back from the Old Country.'

That first roughly served meal remained for ever in Jan's memory. Through the poignancy of deeper feeling, she felt a shiver of distaste for its material discomfort. There were many incongruities in the appointments of the table and the furnishing of the room. Enamelled tin dishes and thick china cups were dominated by massive silver candlesticks, majestic as anchored battleships in the wide expanse of tablecloth; and the bareness of the room which enclosed them in board planking was broken by rows of well-bound books, amongst them old editions in tooled leather.

It was a relief when Al took her out to the coolness of the wide veranda, and placed her in a long canvas chair with broad, flat wooden arms.

'A squatter's chair,' he told her. 'Made so that a tired man can hang his legs across one of the bars, and keep a long drink handy on the other. You just sit there and rest while I fix up the boss.'

'Can I do anything?' she asked nervously, facing the despairing dread she felt of a second meeting with her husband.

The man's blue eyes met hers with candid surprise. 'Well! I should say!' he ejaculated. 'But I'll waltz in first.'

He left her looking out on the level line of lonely paddock fronting the homestead. A post-and-rail fence enclosed a certain space outlining the suggestion of an embryonic garden, indicated by a couple of roughly dug beds. Beyond, the plain of rank yellowed grass rolled to a blue line in the distance which Al had spoken of as the Ranges.

Some graceful pepper-trees drooped beside the house, standing outlined against the delicious blue of the sky. Farther away a group of dark gums broke the monotony of grass and sky.

The eternal *cronk, cronk, cronk* of the bull-frog punctuated the stillness, its ceaseless monotone expressing the extremity of a vague sorrow. The dry rattle became to Jan a maddening, or soothing, accompaniment to the mood of the moment. To-night she heard in it the raucous call of harsh circumstance. This was the life to which her strange marriage had brought her!

Al returned, padding softly over the bare boards in old tennis-shoes. He began speaking before he reached her, his tone both explanatory and apologetic. 'Mort is a bit played out, Mrs Chesney. He's been in a fair fever all day. I guess you'd better go along to your bye-bye, and start in bright and early in the morning.'

Jan rose unsteadily. It was one thing to dread seeing him herself, but that he also desired not to meet her again unnecessarily drove the blood to her face. Before her sudden flame of colour Al's eyes perplexedly sought the points of his dilapidated shoes.

'Good-night!' she said hastily. He was still staring at his shoes when she came swiftly back upon him, holding out a wicker flask of eau de Cologne and some handkerchiefs. 'Perhaps, if you put some of this in a basin of water, and soaked the handkerchiefs in it, it might be cooling, if he's feverish.'

She thrust the futile things upon him. He looked long at them helplessly.

'Poor little coon!' he murmured softly. 'Hope to glory she's got some grit in her; if not, the Lord have mercy on us all!'

Al returned to Mortimer Chesney, bearing Jan's contribution tenderly. 'Your wife's sent these along,' he said, with a touch of restrained reproach. 'Smells good right through the cork;

and these hankies as fine as a bush cobweb, real high-toned. Monogram and all. I'll put them here handy.'

He dropped them on the lumpy pillow. Chesney did not so much as open his eyes.

Al, propping his back against the open door, thoughtfully filled his pipe. 'Women,' he said, smoking meditatively. 'They'd take nine weeks' growth off a man if one started in to try and understand them. So stand off! Look-at-me-if-you-dare! And yet, think I'd hand myself over to any man same as they do, as trusting as a kangaroo pup? No, sir! There's the new missus. One of the white-lily sort—you can see it sticking out a mile; don't imagine she really knows a man when she sees him. How do you suppose the first sight of a ten-days' growth on the chin and a neck without a collar strikes her? She's bound to have had a fair old start.'

Chesney's voice cut abruptly through the darkening room. 'It's hardly an *Æschylean* tragedy!'

'Oh, come off that, Mort!' returned Al impatiently. 'What's given you the hump like this, anyway? It's no time to be thinking of yourself. You've gone in for responsibility, and all that; there's no sort of use slinging chunks of your rotten writing-chaps about. You're up against it, and have got to take right down hold with bare hands. I never thought you had any understanding with women. You've no way with them, certain.'

The indignation of his appeal met the heavy silence of the room.

'I ain't one much for poetry, and fine feelin', and such truck. You supply this camp with all that's needful in that way. But I can see the king-bolt's got jolted someways out of this wedding-shay, and you'd best pull up and shove it in quick and lively.' He shifted his position and dropped metaphor. 'You've gone bald-headed, in your usual style, Mort, for the tip-top best without considering; like that blessed gidea wardrobe we had to lift the roof off almost to get in. There's going to be some lifting of roofs about this too.' His voice softened and dropped to a lower note. 'She's all off her tracks—regular bushed! Tragedy!' he added after a long silence. 'Seems to me there's tragedy enough with a woman around as miserable as a bandicoot!'

Still the silence within the room remained unbroken.

'There's ways,' Al went on presently, 'we men can get upsides even with women; but don't start in thinking you're going to understand her, for there you'll slip up. Get her to understand you. That's your only chance. The track of a 'guana in the grass ain't more hid than the heart of a woman. And don't you reckon to get at that by being dignified, and controlled, and every sort of an unnatural cuss. She'd a deal rather see you perform. I always reckoned you was meant for a dumb-mute; but that won't count against you, not with a woman, if you'll act so as she can savvy you're otherwise a live man.'

There came a growl through the room. 'Dry up, or quit!'

Al stepped lightly on to the veranda with a laugh. 'Well, done for your fleece mate!' he said with the sardonic venom of the celibate.

'What's the matter with this marriage?' he asked himself, arranging a shake-down on the veranda, within hail if Mort wanted anything during the night.

'Whom God hath joined together! Pretty poor job in joinery, anyway. I'd lay any odds Mort's messed things, trying to jam human nature between the covers of some high-toned book. Those writer-chaps make me tired. Not one in the herd knows life, or, if he does, he shies off from putting it on paper. I reckon it can't be done by any human mortal. Life, wrote out in long words and black ink! when the ways of men lie between a shiver and a shake every time.'

He stretched himself contentedly on his hard bed.

A light gust of wind flung into his nostrils the dew-wet scents of night, mingled with the impalpable fragrance of almond-blossom and the pungent, acrid smell of eucalyptus. He drew it in with a deep breath.

'Who's going to sling that, and the feelings it gives a man, on to paper?' he thought drowsily. 'Or Mort's wife?' he added dreamily. His eyes closed.

Through the solemn stillness of the moonlit solitude the *cronk, cronk, cronk* of the frogs went on, with its burden of nameless sorrow.

(Continued on page 311.)

DUELLING IN THE GERMAN ARMY.

By RICHARD THIRSK.

WHEN a German officer loses his 'honour,' he must perforce redeem it in a duel; otherwise he is ostracised and cast out of the army as a coward.

According to the code of rules laid down for the guidance of duellists, an 'affair of honour'

is strictly limited to a quarrel between 'gentlemen,' the word invariably emphasised by italics or inverted commas. In common practice this quarrel is generally over women, wine, or what usually accompanies these—gambling.

The German army, jealous of its reputation,

sternly forbids its representatives to bring before a civil court differences of opinion or grievances arising from one or other of these causes; they have to be submitted to the test of the sword or the pistol, and the innocent has often to risk his life in giving the 'gentleman' an opportunity to recover his lost 'honour.' It is notorious that the majority of men killed in duels have been the victims of those who have in the first instance done them an injury.

One of the few exceptions to this rule was a major of Uhlans, stationed at Strassburg, who came scathless out of seven duels, in which he killed two of his opponents, permanently incapacitated three, causing them to leave the service, and slightly wounded the remaining two. This major, a man of unimpeachable character, as the writer can vouch, had the misfortune to be married to a neurotic woman who thought as little of his honour as she thought of her marriage vows. Hence the seven duels, fought in the course of sixteen years, with brother-officers whose relations with the *Frau* major had at varying periods become open scandals. For the sake of their only child, the major refrained from having recourse to the divorce court; but when the daughter, coming under the influence of the mother, turned against the injured father, he ended his earthly troubles by a bullet.

It must not, however, be inferred that because duelling is an everyday occurrence in the German army it is entered upon in the light-hearted fashion of German students, who, in their *Mensur*, or students' duels, think as little of hacking at each other as they do of playing tennis with a friend. Such *Kinderspiel* (child's-play) is not permitted in the army. A duel is a serious business, fraught with far-reaching consequences; and, as the conditions necessitating a duel may arise out of the most trivial incidents, it behoves men in uniform to be constantly on their guard, particularly when they show themselves in public places.

Here is an instance of how a young lieutenant's career was ruined through no fault of his own. He was boarding a Berlin tramcar, when a workman, in the act of alighting, jostled him. The Berliner, by the way, is not particularly noted for politeness. Words led to threats; whereupon the workman behaved in a most un-German fashion—he boxed the lieutenant's ears. By this time a policeman had arrived on the scene, and promptly took the workman to the police-station. A court case followed, giving publicity to the affair, which thus came to the knowledge of the lieutenant's superiors. They told him that since his honour, and likewise the honour of the army, had been sullied, a duel must be fought with the offender. But, as the workman was not a 'gentleman,' and therefore incapable of giving 'satisfaction,' a duel with him was an impossibility. In the end, after a vain appeal had been made to the Kaiser to quash

the case, the lieutenant was obliged to resign his commission. Having pronounced its decree, the *Eherenrat*—an unusually honourable institution for Germany—could not go back upon its word, could not even tear up the 'scrap of paper.'

The *Eherenrat*, or council of honour, is a duelling court to be found at all military centres, and is composed entirely of officers, who meet in secret conclave. Its functions, apart from the fact that it draws up the code of rules respecting duelling, savours somewhat of the comical. After condemning a man to fight a duel, and even deciding by what means he is to try to kill his opponent—whether by sword or pistol—the same *Eherenrat* sits in judgment on the victor for the harm he has done to the unfortunate 'gentleman.'

The Kaiser is *ex officio* the supreme head of these councils of honour, and takes a very practical interest in the reports of the deliberations submitted to him. While his exalted position in the State places His Majesty above duelling or the possibility of being challenged, just as his titles place him above the law, he nevertheless professes to be a passive duellist in the sense that he encourages the practice on moral grounds, as he phrases it. Besides making his officers punctiliously careful in their conduct, and enforcing them to act on all occasions like 'gentlemen,' in the Kaiser's own words, 'it [duelling] is an ever-watchful eye always upon them [the officers], guarding their personal honour and also the honour of the German army. It likewise makes my officers courageous, accustoming them to the thought of facing death, which is the true aim and object of their vocation.'

Soon after giving expression to these extreme views, the Kaiser was virtually made a laughing-stock by the anti-duelling party, which is composed mostly of those who have been bereft of near and dear ones as a result of duelling. A pamphlet published by this party pilloried the *Eherenrat* as a crude survival of barbarism. The writer, who had the temerity to sign the pamphlet, had lost a son in an 'affair of honour.' He had at one time been an officer of the reserve, and the president of the *Eherenrat*, representing the regiment to which he had formerly belonged, sent him a challenge. By way of baiting the *Eherenrat*, the pamphleteer raised various legal objections; whereupon he was threatened with degradation and ignominious dismissal from the army. A lengthy correspondence ensued, which was ultimately made public; and, after a final appeal had been made to the Kaiser to intervene, the writer of the offending pamphlet professed his willingness to accept the challenge.

It should be explained that, in its haste to defend its honour, the *Eherenrat* had failed to make any investigation as to the writer's identity. Imagine, therefore, the brave president's surprise when he, a swaggering captain

of hussars, was confronted by a feeble old man upwards of eighty years of age! Needless to say, that duel was never fought. Nevertheless, the *Eherenrat* found it necessary to vindicate its honour by making a show of turning out of the regiment a man whose name had not been on the army list for more than twenty years.

Various learned professors are in the habit of expounding at great length the psychology of duelling. One explanation of the extraordinary vogue may be the comparatively small value placed upon human life in Germany. Another, and more potent, explanation is to be found in the mawkish sentimentality of the nation, which has induced it to establish such extraordinary standards of honour that men, and even school children, do not hesitate to destroy themselves if they feel that they have been thwarted or ill-used.

This curious trait of character in the German was emphasised in a duelling tragedy that created unusual interest in military circles some time ago; but public interest was not excited, for the simple reason that the affair was never satisfactorily explained. The hero—if there be an element of the heroic in duelling—was a Captain von Stein, stationed at the fortress of Wesel, near the Dutch frontier. A son of the pastor, Lieutenant Shramm, belonging to the same regiment, had wooed and won a local beauty, whom he was on the eve of leading to the altar. In accordance with German custom, the wedding guests, mostly officers and their womenfolk, assembled at the house of the bride's parents in time to celebrate the *Polterabend*, as the evening preceding a marriage is called. There was the usual feasting and merrymaking that mark such an occasion; and, the hosts being people of means, the guests were encouraged to drink freely of the heady wines of the Rhine and of France.

When the party broke up in the early hours of the following morning, to return next day in time for the celebration of the nuptials, the younger men, deciding that sleep was not necessary for them, since they were well primed with wine, adjourned to the hotel Zum Schwarzen Adler, where they continued their carouse. Though the party was lively, it soon tired of drinking and singing, and approached perilously near to the yawning stage. By way of diversion, Captain von Stein and the bridegroom, naturally the most important member of the convivial party, wrestled for a throw. In one of the bouts the latter had the misfortune to rip open a seam in the captain's best tunic. This so annoyed Von Stein, a quick-tempered man, and drunk withal, that he straightway boxed Shramm's ear.

Up to this point the bored spectators had paid little or no heed to the wrestling, but the sounding smack on the ear was like a bomb dropped in their midst, silencing them. The bloodthirsty element, the honourable members

of the company, decided that such an 'ungentlemanly' act could have but one sequel—a duel. They formed themselves into a temporary *Eherenrat*, and, after maudlin deliberations, condemned Captain von Stein and Lieutenant Shramm to exchange shots at a distance of twenty paces until blood was drawn, decreeing that the duel was to take place at dawn, within an hour of the time of passing sentence.

In a German garrison town the regulation duelling pistols are always ready to hand. When these had been procured, a couple of motor-cars were commandeered to drive the duellists, accompanied by their seconds, to the Heide, a large moor outside Wesel, used as a terrain for military manoeuvres. Captain von Stein protested in vain that he had merely boxed the bridegroom's ear in fun, and that he did not wish to shoot a comrade on his wedding-morn. His seconds warned him that as the affair had already gone so far, they were there to see the business through, and that if he refused to fight he knew the penalty. A suggestion that the duel might be postponed until after the honeymoon likewise fell upon deaf ears.

Since there was no escape from the terrible consequences of his drunken act, the captain, somewhat sobered, magnanimously decided to shoot into the air. Thus resolved, he faced the bridegroom at a distance of twenty paces.

According to the decision of the *Eherenrat*, Shramm had to fire the first shot. Unfortunately his pistol missed fire, which counted to him as his round. The captain was then ordered to fire; and instead of shooting into the air he misjudged his aim, dropping his hand too low before pulling the trigger, and the bullet found its billet in the bridegroom's groin, causing him to stagger and collapse on the heath.

On ascertaining the seriousness of the wound, Shramm's seconds hurried him off in a car to the nearest military hospital. Doctors were hastily summoned, only to pronounce the bridegroom beyond their skill. He died without once recovering consciousness, within a few minutes of the time when, but for the duel, he should have met his bride at the altar.

In due course the captain was brought before a white-gloved court, which passed sentence of six months' detention in a fortress, a form of 'honourable punishment' meted out to 'gentlemen in misfortune,' and in no way to be confused with imprisonment. A duellist confined in a fortress suffers few privations, and at the end of his term returns to his former duties more of a hero than a criminal.

Captain von Stein, however, saw little of the heroic in what he had done, and when he rejoined his regiment his brother-officers were grieved to find him changed. He had become moody and morose, and, instead of being the life of the mess as formerly, he made no secret of his dislike for society.

At first this was condoned as the reaction on a sensitive nature prone to brood on the past, to magnify the misfortune of having killed a friend in a duel, for which, in the eyes of the law, he had already paid the full penalty. Therefore they did their best to humour him, confidently expecting that in the course of time he would forget his sorrow. After the lapse of a few months, instead of getting better, his nervous condition became so serious as to give rise to grave alarm, and he showed signs of developing suicidal tendencies.

Change of scene and various other 'cures' were tried without success. Ultimately the doctors struck upon the brilliant idea of matrimony; if his parents could induce him to marry, he would then have some object in life other than brooding over his troubles.

Accordingly it was arranged that the captain should marry a cousin for whom he had cherished an affectionate regard about the time of the duel. Though inclined to protest when the idea was first mooted to him, he ultimately yielded to the advice of his people; and, as the girl was full of sympathy for him in his affliction, the two were formally betrothed amid the usual rejoicings and drinking that mark this important event in Germany.

At the captain's express wish the wedding was fixed for an early date. His betrothed, so it was concluded, had begun to have such an influence over him that he showed signs of again becoming normal; and as the wedding-day approached, his relatives congratulated themselves on having at last discovered an effective cure. This wonder-working influence was even more pronounced at the *Potterabend*, when the captain was the life and soul of the party, replying in humorous vein to the long-winded

speeches, and charming the company with sentimental love ballads set to those melancholy melodies so dear to the heart of a German at moments when he feels gay. In fact, the captain was so elated that it was only with difficulty the bride, who on the morrow was to be his wife, could persuade him to leave her and return to the hotel where he had his quarters.

No little surprise was occasioned on the following day when he failed to put in an appearance at the church. While the bride waited for him messengers were sent in haste to the hotel, where they learned that he was still in his room. As he did not respond to their repeated knocks, it was ultimately decided to force the door.

On entering, the messengers discovered the object of their quest stretched at full length on the bed, dressed in gala uniform, as though he had carefully prepared for the wedding and then lain down to sleep. Their cheery greeting, intended to wake the sleeping captain, called forth no reply. He lay motionless, and the suspicions of those who had come to fetch him to his wedding were aroused by the sight of blood-stains on the quilt. A closer examination revealed the ominous fact that he held a pistol in his lifeless hand.

Slowly the horror of the tragedy dawned upon the awe-stricken spectators. No one in the hotel had heard a shot, yet it was painfully evident that Captain von Stein had chosen to depart from this life in the same manner as he had despatched Lieutenant Shramm, and by the same pistol which he had used to kill his comrade on his wedding morning. Honour was indeed satisfied, and two brides had waited in vain on the steps of the altar for bridegrooms whom they would never see.

THE HUNT.

A WAR NATURE-STORY.

By F. ST MARS, Author of *On Nature's Trail*, &c.

THE silence of evening lay upon the scene—upon the dull oaks, the duller pines, the little burnished stream that laughed all to itself down there among the thickets; and there was nothing alive there, absolutely nothing, if you except three coal-black crows beating slowly, in ominous line, across the valley.

Then the wolf came. At least, he was there, standing just on the edge of the thicket, motionless, close to the stream. Once he lifted his head and sniffed at the breeze; but, save for that, for three minutes he did not move. Then, lean, gaunt, and gray, he slouched into the open, down to the stream, and drank.

Then suddenly his head went up. There had come no sound, no sight or sign—nothing. He

knew, nevertheless, and slowly his head sank, his body stiffened, and he began to draw himself together.

Presently, among the buttressed tree-boles, it was as if stars shone. Only for a moment. Then there was a faintly burning gleam, a hint at something light, a ghost of a shadow, and it was gone, and the wolf after it. It was first the eyes, then the vanishing light rump, of a roedeer.

The crows had just flapped out of sight, but the silence of evening still lay upon the oaks and the pines, the deep valley, and the polished stream. Not a living thing, it seemed, existed there; but the twigs were still swaying where the wolf had passed, and up above, among those

buttressed tree-boles, bodies showed and a twig cracked. It was Russian skirmishers advancing cautiously.

There was a pause while the men came toward the stream and lay down there. One drank almost at the spot where the wolf had lapped only a few seconds before.

Then a young officer crept off cautiously downhill, along the stream, alone. One scout had not returned. He was not satisfied with the reports of the others. From bush to bush he crept, bending double, until finally, on the edge of cover, he pulled out his prism binoculars and searched the opposite hill across the gorge. Then he crept back to his men, spoke swiftly, and one of them, turning on his knees, signalled back with his extended arms, 'No enemy in sight.'

A messenger took the signal, and translated it to a field telegraphist, who flashed it to the General at headquarters a mile or so away. The army, it seemed, could advance across the valley with safety.

Down the slope slid the wolf on the trail of the roedeer. There was no particular hurry, because the animal did not live that he could not run down in the end, though it might trick him. Nevertheless, his speed was amazing. He seemed to take the rough ground, the boulders, the long grass, the deep yawning thickets, the hollows, the low branches, as if they were all a race-track. Nothing appeared to check him. Nothing could stop him. He just kept on at his easy, loose, leggy, wolf's lope, head down, tongue lolling, nose glued to the scent of the beast which, of course, he had long lost sight of; for the roe is the most clever of all deer in the hunt, up to every known and unknown trick of the trade, and as difficult to run down as a will-o'-the-wisp.

The wolf ran mutely, chiefly because he was alone, I think. Only did he make an anxious little whimper, as a dog will in hunting a rabbit, when he was checked where the roe had run back on its own trail, or galloped in circles, or flown—jump would be too clumsy a word to use in regard to the fairy roe—from side to side, or leapt over a fallen tree-trunk and leapt back again. But if the roe was a past-master in playing with its pursuer, and in laying the most puzzling trail on earth, the wolf was a past-master too in unravelling and puzzling out trails, and although often brought to a check, was never actually for more than a few seconds at fault.

He managed on the whole to drive the trail with a fine speed, and to keep his quarry and himself going not too far apart. There is a point about this, because he knew, as all hounds do, that if the quarry gets too far ahead the scent fades and runs out, and there is nothing left to follow.

Up the hill he loped, long and low, as a wolf does—thanking his luck, perhaps, that this was a good scenting evening; for he was very hungry,

that wolf—till at last he came to the scattered plantation of young growth, with bushes and bracken between, as I have said; and here a strange thing happened. The trail suddenly broke where the little deer had made a great startled leap, and then executed a wide bend, evidently at full speed.

Next moment the wolf was sitting on his bushy tail in his effort to stop rather more than instantly; and there was a good reason. He was looking, through the bushes and bracken of course, straight at the helmets and shoulders and packs of a regiment of German infantry lying prone on the ground. And at that moment, though naturally he did not know it, the binoculars of the young Russian officer, on the slope opposite, were focussed on that very spot, and saw, as we are aware—nothing.

The fraction of time that the wolf took to grasp the situation, check, and get into his stride again was about as long as we should take—those of us who are so frivolous—to wink. Nobody saw him, and he made no sound. But, then, nobody saw the roe either, and it made no sound. They were, you see, wild things, and always at war. That is where they differed from the troops. They had a highly perfected system of not being seen. They had to. Otherwise they could never have survived to be there at all.

At the end of the young plantation the wolf took up the trail again, and hunted it into the wood. He had one ear cocked behind him and one in front. Certainly he was ill at ease, but he could scarcely be more on the alert than usual, because that would seem impossible.

Anyway, he did not sit down on his tail a second time when, in the heart of the wood, another gap in the trail told where the little deer had given a second leap of fear to one side. He merely swerved, and without so much as a fractional pause continued his way, at slightly increased speed, on a wide detour. There were reasons—I don't know quite how many, but some hundreds—and the wolf had seen them: a regiment of Uhlans standing silently to their horses in a series of glades in the wood.

And at that moment, as we may believe, the binoculars of the young Russian officer on the far side of the gorge opposite were searching over that very wood, and had seen nothing therein.

The wolf rediscovered the trail on the far side of the wood, and carried it along again across the broken, bare ground. But his heart was in his mouth and his tail between his legs the last half of the way. He fairly flew over the ground like a hunted cat, and he only went forward because it seemed no more risky than going back. The trail zigzagged like a snail's track; and there were good reasons, for at every swerve he noted a pit, carefully screened by cut brushwood, and in every pit, out of the tail of his quick eyes, he had time to see the tops of the helmets of German artillery soldiers and the grinning mouth

of a field-gun, all staring across the gorge together.

And we are fully aware that even at that instant the binoculars of the young Russian officer, reconnoitring in advance on the far slope, only saw him (the wolf), and nothing else.

Though he might have been no more than a fleeting cloud-shadow, the wolf feared that the helmets in the pit might have seen him, and fear lent speed to a beast already a very wild grayhound. He fairly tucked up his tail and ran for it, so to speak, going over the bare top of that hill like a hunted cat over a wall. All thought of the quarry had, I fancy, vanished from his brain—for the time, anyway.

Next instant the wolf was sliding forward with doubled body, all four legs stuck out in front, and his tail waving wildly in the dust. He had almost run bang into the roedeer coming back up the hill toward him, going like a six-inch shell.

But that was not the point. He knew it when the little buck, taking no more heed of him than to execute a lightning zigzag to let him by, shot straight on, back over the hill-top. When the hunted fear not the hunter it is time for the hunter to look to himself; man, or some great calamity, must be nigh.

As a matter of fact, the point was a battery of howitzers—all crews standing to the guns, and nothing hidden this time in any way, because the hill hid them—set out in a nice, neat line some little way down the slope, which on this side was perfectly bare, and ran down to a road. Howitzer guns, as you probably know, are peculiar in that they can fire round corners, or, rather, over the tops of hills, at that which is out of sight on the other side. They are rather handy at times such as—well, such as this.

Did that son of a she-wolf sit down to howl or scratch or admire the view? No, sir; he removed. That is, he was gone, and the manner of his going was so instantly instant that he and the roedeer crossed the skyline, going back by the perilous way they had come, almost together, and it did not need a chorus of file-edge German laughter at their heels to hurry them. After all, a wolf is but a wolf, and a roedeer is but a deer; and neither was designed by nature to have anything at all to do with modern civilised (?) warfare. What would you?

The Russian General received the message, 'No enemy in sight,' when he was, as has been said, but a mile from the skirmishing line. He glared through his powerful prisms down to the gorge. Then, instead of giving the order to advance, as every officer expected, he—shook his head.

Next instant that General was whirling in his car to the point of reconnaissance, and on the way he was trying to think what he should do

if he were in the enemy's place. He thought, and—shook his head again.

Then he crept down through the skirmishing line, and, almost on hands and knees, joined the young officer, who had returned to his point of vantage behind the bushes lower down. *Mon Dieu!* but that was a man! In his spare time before the war, when he was not studying to hunt Germans, he was a famous hunter of big game.

Behind the bushes he put up his binoculars and stared at the slope anew, and the first thing he saw was the wolf and the roedeer, almost neck and neck, coming down over the broken ground toward the wood as if all the unemployed demons in hell were at their heels.

And then he laughed. That huge man, into his enormous beard, laughed. He knew that carnivora and their prospective prey do not race thus—so to speak, almost arm-in-arm—without something powerful in the form of a fright to shake them off their bed-plates, as it were. And what would frighten them to forget their instincts in that way? Swift as thought, the General reviewed them in his brain—fire, flood, earthquake, and *man*. Ah!—and *man*. Just so. Not one man either, probably.

Then the General crept back to the skirmishing line, and spoke swiftly; it sounded rather like the remarks of an angry leopard. I don't know quite what he said; but before he had reached his car the order, 'Aeroplanes will ascend,' or the Russian equivalent for that same, had been signalled back from the spot, and the field telegraph was flashing it to the Flying Corps miles behind.

The gray wolf reached the wood, dodging all in and out between the masked pits—each with its grinning gun and its cluster of helmets pointing at the far slope—like a quickly drawn, flickering gray line; and another line, the roedeer, took the wood too, but twenty yards away. Neither stopped to ask questions. Neither wished to avoid or meet the other. Cover was what they most ardently desired, and cover was what they found in the wood. Peace also they craved, but peace the wood did not give.

The wolf—crouched low among the bracken, tongue lolling, ears cocked, peering about—was aware of the stamping of an impatient horse somewhere among the shades, of the *champ*, *champ* of a bit somewhere else, or a snort in another place, and of low voices that startled a hidden wild boar into a grunting, crashing, precipitant retreat. Also he heard the remarks of a fox, who said that man was near. Not that he needed the information; his nose, his wonderful nose, had already told him all about that.

And at that moment the Russian General, hidden among the scattered trees and bushes on the far slope, was creeping back to the skirmishing line.

The wolf turned and slunk aslant the slope among the tree-boles, a nearly invisible outline in the semi-twilight that always reigned among the trees. Then, peering under a bush into a glade ahead, he had a very nice view of a spurred top-boot at about two yards' range, and that wolf had spun on himself and evaporated before you could cry, 'Oh my!'

The wolf turned and slunk aslant the slope another way, till a bush in front of him became suddenly violently agitated; and, looking up, he beheld a horse browsing while he had the chance, as cavalry chargers soon learn to do in a campaign. That wolf retired like a miser when the hat comes round. After all, it was no business of his. Men alive and sound, except as plagues to be avoided, never were profitable business of his. Men wounded or dead—well, what would you? He had to live somehow, not being born a vegetarian.

The man who invents a silent aeroplane engine will assuredly make a fortune, or the man who gets hold of the patent will. The wolf heard the unmistakable droning throb—a sound not unknown to his ears since the war started—almost before any other creature in the wood heard it, except the roedeer, and he stopped. He just stuck right there on a dead centre, so to say, staring about. I don't know why the noise affected him so, save that he did not seem able rightly to tell where it was; and animals—not birds—seldom look up. Next he broke into a loose trot, threading the maze as a city clerk does thick traffic, and fate ordained that this time he should look up.

What he beheld was a Russian military aeroplane, as it were a butterfly, crossing a gap in the delicate frosted tracery of top-twigs high overhead, and he dropped so instantly and utterly flat that the ground might have been slid from under his very feet in that moment. But it was not the aeroplane perhaps, after all, that acted upon him thus. It may truly have been another thing that happened in that instant too.

The report of a heavy German field-gun shook the quiet, echoing wood like a clap of thunder, rolled all round the neighbouring hills, and died in far-away rumblings. Came then the shriek of a shrapnel-shell, and the burst; and the drone of the aeroplanes rose an octave or so, as the hum of a wasp does when it is angry. But it was too late. The aeroplanes had seen all, everything, and had signalled everything back. The Germans feared as much. That is why they fired.

Then clap on clap of gun-thunder from the sunken pits on the broken ground up above the wood, and the hum of the aeroplanes rising higher and higher. And then, and then, without a second to prepare one for the shock, there irraptured an infernal thudding, pounding, shattering roar from across the gorge, on or behind the opposite

slope. It was the Russian guns, batteries of them, which had come into action, knowing—thanks to the aeroplanes—that is, to the General—that is, to the wolf—just precisely where to fire on the nice, tight little force of the enemy, so deftly hidden and arranged to ambush and cut them up.

Nothing that I could tell you would describe the sound of those guns in action; nothing that I could imagine would fit in to compare with it. Heaven knows what the wolf thought, or if he thought! Anyway, for the space of a few minutes he did not move. Then he saw several things happening so quickly that they all appeared to come about at once. He saw a tree behind him half-vanish in a cloud of smoke and burst into flame. He saw—now he was on his feet and racing hard downhill—in a glade an awful tangled confusion of men and horses, a plunging, snorting, pounding whirl, vainly trying to mount and get away from the shells that were vomiting stabs of flame and thick smoke all among them. He saw, as he checked for a moment on the edge of the wood, little bursting puffs, as it were of cotton-wool, all here and there among the sparse scrub and slight plantation; beheld men spring, in rows and ranks and masses, from the bracken and brushwood, and start to run uphill; watched the shells suddenly puff out among them, and, as the smoke drifted, noticed that there was only fiercely burning bracken, and no men, where the smoke had been; saw the waves of men rushing upward split into gaps, the gaps widen, the men stumble and never get up again; and heard, as it were in a dream, the neighing and screaming of horses, shouts, curses, and reverberations of explosions, as the artillery on the open ground above vainly tried to clear itself from the sunken pits that were no longer a secret, but a death-trap.

Then that wolf stuck his head down and his ears back, and ran for it. No words could tell how he appeared, because he didn't appear, except in flashes, so to speak. He just became a succession of somethings crossing open spaces or openings among the bushes, like a flickering gray line. How he avoided braining himself a hundred times against gnarled tree-bole or gray boulder, he and the wonderful Nature that made him alone know. Nor can any one understand in what manner he failed to dislocate his neck against the legs, or spit himself a score of times upon the bayonets, of the broken and amazed troops whom he met in his path toiling desperately and hopelessly up the slope. Windfalls he took like a bird, boulders he negotiated flying, bushes might have been cobwebs by the way he cut through them straight as a gimlet, and rows of ducking, dodging, half-stunned, partially blinded men he went through, snapping, snarling, slashing, all in a breath, as forked lightning goes through massed thunder-clouds. I don't know what the troops thought. They never said. Perhaps they never remembered, their minds being for the

moment full, to the exclusion of all else, with getting away from those hellish Russian shells. Once a shell burst behind the beast, and he went straight through the air, quick as one of the shell's own swords of flame; once one sent the ground dead ahead of him into the sky, and he skewed round on such a wonderful slant that he hit the legs of some one toiling above and to the right of him, and the two came downhill, rolling and spluttering together; and once a tree above him took unto itself smoke and a noise instead of a middle, and the top-half of that tree fell, with a rending crash that you could barely hear, only just a foot behind his madly tucked-up hindlegs.

As he streaked down the bottom of the gorge, the bushes and thickets streaming by as they do when seen from a railway-carriage window, he was aware of the slope on his left rustling to the stealthy advance of thousands of armed men, and of one continuous bubbling roar behind the slope where the guns were. On his right the whole hill was a smoking, fiery hecatomb, the woods ablaze, the bare ground a reeking cauldron, up from which, like ants that swarm from a burning nest, the German troops were crawling over the skyline, where the shells were spouting and flaming like fireworks.

But the big wolf was not alone in his retreat. Every thicket whispered of a hurrying body; every bush swayed after the passage of something that had but just brushed against it; the damp places showed footprints still filling with water. Now it was a momentary picture of a mighty bristling head, gleam of tusks, red, tiny, wicked eyes, and flecks of foam—a wild boar. Again it was a crash, a whipping of boughs, a great reddish body, antlers that show at the twelve tips, and swaying boughs hiding all—a stag going like the wind. Yet again it was a spitting, swearing, fiery-eyed something, bounding like some electrified ape from spot to spot—a wild cat terrified out of all its nine lives.

And then, 'twixt one gasping breath and the next, it was all over; the fight had swept beyond the gorge, the hill barricaded out the noise, and the wolf was galloping on alone, with the maddened wild folk, all removing at full speed, all seeking, and succeeding as only the wild folk can, self-effacement as they removed.

The wolf, coming round the bend of a game-path, suddenly uttered a funny little frightened yap, just as if somebody had hit him with a whip, and shot straight up and onward into the air. There had been nothing to warn him. He had rounded the bend, and was upon the dark furry form lying flat in his path before, we conclude, he could think. But the wild folk do not stop to think; if they did there would be far fewer of them in the world alive to-day. They act first, and think after. And he, the wolf, being unable to check his terrific momentum, sprang wonderfully into space.

The bushes at the side received him with a crash, he stumbled, recovered, made to bolt on, and at the same instant he caught the taint of the beast that had been in his path. In a second his forelegs straightened, his head went up and back, and he slid forward on his bushy tail in a little shower of broken twigs. Then he calmly got up and slunk back.

It was the body of the roedeer, which must have got in the way of a bursting bit of shrapnel. The beautiful silky-coated little deer was lying quite dead in the game-path.

The hunt was at an end; but neither wolf who had succeeded, nor poor graceful little roedeer who had lost, ever knew, ever guessed, that but for the hunt a Russian victory might—probably would—have been a Russian 'regrettable incident.'

Thus, then, without being aware of the fact, truly, but surely for all that, both animals had paid that debt which they owed to Russia, one of whose noblemen had preserved their races for years, and kept them, at great cost, safe from extinction in that place.

But, as the Russian General said when everybody congratulated him afterwards for being possessed with second sight, and he became known as 'the man with the X-ray eyes,' 'You can say what you like. It is to those two wild beasts that you owe your thanks. If they had not warned me I should never have known.'

CONTENTMENT.

I WANDERED down the wild sea-beach,
With stretch of sinuous sand
Which bound, as far as eye could reach,
The ocean to the land.
The curlews and the razorbills
Flew fearless out to sea;
'Would I could leave behind earth's ills,'
I mused, 'and be as free!'

Anon, as through the lanes I went—
The twittering hedgerows round—
A robin's song its sweetness lent,
Which kept my heart spell-bound.
'Ah me, to be a bird,' I thought;
'Theirs is the happiest life,
Free as the winds, and caring naught
For our grim world of strife!'

Once more I wandered by the shore,
Now storm-strewn and severe;
There lay the birds, their brief life o'er,
Flung by the tempest here!
I sought the lanes, in sheer dismay,
My robin pert to find;
But only feathers, red and gray,
A hawk had left behind!

And this is true—as true as came
The lesson to my heart:
Ah, what is wealth? Ah, what is fame
In which peace has no part?
Contentment is our greatest gift;
Without it, who is free?
The soul of man its strength can lift;
In it is liberty!

ALFRED SMYTHE.

Chambers's Journal

SEVENTH SERIES

THE NORTH SEA COAST.

By WILLIAM T. PALMER, Author of *Odd Corners, Odd Yarns, &c.*

TO-DAY the eyes of all Britons are on the North Sea coast. In a normal winter few persons beyond lovers of outdoor nature or owners of shipping think much of the six hundred miles between the Pentland Firth and the Strait of Dover. It is a coast most varied in scenery, the chalk-cliffs and sandy shores of the Forelands giving way to the oozes and marshes of the Medway and the Thames estuary, following on up the creek county of Essex to the Broads or brackish meres of Suffolk and Norfolk. Then eastward by a shore backed by dunes or sand-cliffs to the Wash, an indefinite place where tideway and river are so much alike, and north by the sands of Lincolnshire to that great arm of the sea, the Humber, penned in behind the tongues of hard shingle which make up Spurn Head. Northward again is a sandy shore up to Flamborough Head, whence forty miles of grim cliff carries the coast to the mouth of the Tees. Durham is a county of good, if narrow, harbours; then comes coaly Tyne, where a world of shipping is for ever on the march. Northward ho! one soon leaves the land of the merchantman and trader, and the coasts of Northumberland become very quiet indeed. Here are the Farnes, with millions of sea-birds ever about their stacks of rock, and the Holy Island, where the brent geese first strike our shores. The coast is not really wild up to St Abb's, where there are more cliffs sacred to the guillemot and puffin and razorbill; and then comes that mighty slash which Nature dealt at Scotland, and nearly cut her in two—the Firth of Forth, with the Bass Rock, the great haunt of the gannet or solan goose. Fifeshire coasts are proverbially sandy, for is not that the county of St Golf? Then we are on the Tay, a long, narrow waterway extending through quiet countrysides up to Perth. From Forfarshire northward the coast varies much, though on the whole it is rocky; its little rivers provide small fishing ports, the home of a very hardy population, the shore here lined with forest where the capercaillie calls, there shelving up in bleak, cold parishes to the forest-bound Grampians. And in Sutherlandshire—what nature-lover can hear the name without a thrill and a sweet thought for Charles St John, most genial of sportsmen and naturalists?—the wanderer on the shore can see the curious slot of the wild red deer among the paddle-marks of

swans and geese, ducks, scoters, and divers. But wherever you go, and at whatever time of year, there is a tang, a cheeriness in the air which speaks undeniably and unmistakably of the one North Sea coast.

How many happy winter days has one spent on that glorious frontier, and what hours of incident! The night when, on a pile of wet rushes, one lay and soaked while the wild swans whooped and whistled and clanged overhead; or that day when, without an instant's warning, the sea-fog fell and cut one off, miles from sound land. For an hour one seemed to grope in the white smother, trying this way and that, at every turn stopped by gray channels of tidal water, quietly, inexorably advancing; and behind the curtain of mist wailed the curlews, the ducks gabbled or barked or grunted according to their nature, and there was all manner of sounds from divers and waders. The keenness of the observer was quite overborne by concern for safety before the first soil-stained spit giving way to tufts of sea-grass was reached; and from that point one bade defiance to the soft-hissing tide.

Then there was that morning, after a week of storm, when the sands were dotted with wreckage and the slain. There is one cove in a rock-bound shore into which the currents seem to bear all the flotsam and jetsam of a score of miles. There this morning one finds dead birds in knee-deep piles; and what a medley there is: land-birds by the hundred, sea-birds by the score! Although Nature has marked out her two great periods for bird migration, large flocks of birds, sometimes entirely of so-called resident species, are on the move at all sorts of times and seasons. This is the factor which effectually bars all solutions of the problem of migration on ordinary general principles. There are more casualties during a storm from the east-north-east, that favourite quarter for winter gales, than at any other time. Birds are not able to fly far in front of a storm; the wind, ruffling their feathers from behind, allows cold and rain to reach the skin and to produce cramp and death. A westerly gale, unless very powerful, cannot greatly delay the flight of even such weak birds as the goldcrest and the common wren. A pile of dead birds is a particularly melancholy sight. Drenched with the sea, loose with death, the

plumage is pitifully bedraggled; and even the divers, whose feathers are so short and close that in life they feel like fur, are unkempt. There are usually a few petrels in such a pile, and guillemots, puffins, razorbills which undoubtedly have been struck from the rock-ledges by the bouncing surf. A great skua stretches across the sand, a pile in itself; and at times one finds cormorants, gannets, gulls, with on one occasion a heron. Now and again some careful longshore worker will find a prize in these piles of dead; but I would rather be the Lincolnshire naturalist who notes the living presence of a Continental blue-breast in the crowd of tired finches which this morning dropped like stones a score yards from the tideway.

Then—another idyll of the North Sea coast—the evening when one heard the booming sound of a bittern, and, murderously inclined, went indoors for a gun. The trio of collectors' agents did not relish the charge of snipe-dust which most unexpectedly swept down the dike in which they were concealed. But, alas! the bittern was away at dawn from that square of seashore marsh, and my hopes for a nest or more in the county were at an end. But it did, thanks to my intervention, escape alive; still, the following season my family of ruffs did not. The brown rat is a terrible curse, and almost human in its desire to feast upon any creature which happens to be scarce in the locality.

There is a phase of the North Sea coast's bird-life which one never forgets—nesting-time on the cliffs. I came to the shore rocks after many a climb for the nests of eagles, ravens, buzzards, and peregrines, and my experience almost proved my undoing; for rocks which for centuries have been washed by storm-waves are often broken and unsafe, though their nature be of granite itself. The only safe method is by the rope from above, and it is wonderful how easily, by aid of simple tackle, one man can raise or lower another at the end of a long rope. How the affrighted birds wheel and scream; how their beaks gape and grab, their wings threaten and fan! The nests of sea-birds are, as a rule, vilely malodorous. The golden eagle, king (scavenger) of the mountains, is in comparatively sweet quarters.

The nights of February see the wild swans settled on our coasts. In shooting years one waited patiently in the rough shed by the tide-way, waited until the frozen straw tinkled and crackled underfoot. That was sport. But now it is more customary to go armed with field-glass and camera, and to forget both in the delight of wild birds in full view. I envy the man who has never seen a flock of wild swans or wild geese rise from the water and wheel up and up until a course for a safer place can be made. Think of it in retrospect: the little band of birds, moving on with the tide, ever on the feed, with a sentry bird going hungry and on the alert. Then the quick, low gabble—danger! The birds float nearer together; yes, there is the enemy! An instinctive squat back on the waters, an outstretching of necks, a leaping, a splashing, the whirl of wings, and the ripples slope away from the point where the birds floated a moment before. The little knot of birds, so close together that one expects their wings to foul, is off. After their first beat they curve back almost to overhead, but too high for any details to be visible. Now, think of that, one's first experience, and envy the man to whom it may occur for the first time to-morrow, when the sun is setting behind the snow-covered hills, and the restless tide is flowing like a ribbon of blood to the west.

One would like to write much of the men of the North Sea coast, men with harsh Norse dialects, with the giant frame and square face of the typical Dane, families French or Dutch or even Cornish. There is the Gaelic fisher of the northernmost counties, the dour, hard Scot of the Moray Firth, the gentler types down the south of Scotland, merging into English of the various counties. But though varying so much in trade and language and outlook, there still remains a stolidity wholly admirable, a common pluck and obstinacy, among the North Sea folk. How from Pentland to Dover they will hail you with news of some rarer bird seen at the fishing-ground, and how difficult it often is to avoid a voyage on a rough, cold day in an open boat to clinch some bit of information, 'Jan says it is, but I says it isn't!'

THE BRIGHT EYES OF DANGER.

CHAPTER XXI.—THE WATCHER WATCHED.

THE drums of the Town Guard were beating the ten o'clock round when I led my horse out through the narrow funnels of the town. A wind was rising, hallooing overhead, the swinging signboards complaining in its rough grip. The sky, a crooked riband bridging the tall 'lands' that flanked the streets, was discoloured and charged with scurrying rain-clouds. Sedan-chairs carried fair occupants

homeward, their flambeaux lighting up their path making fitful little dabs of colour in the dark. A few warning drops of rain fell. On the causeway sounded hurrying feet and the click of pattens. The threat in the weather-signs was clearing the streets.

The Jacobites, after Preston, had little need for guarding the city. There was but one Highland sentry, a yawning lout, posted at the Port,

more for form's sake than utility. Some small silver banished his scruples, if he had any, and I left him hiding the coins in his sporran, a pleased grin on his jowl.

The road was villainous, cut up by unaccustomed traffic of foot, hoof, and wheel, a weariness for man or beast, so that I dismounted and led the horse, ploughing on head to wind, till I got me into the valley below the town. Here the wind abated somewhat; but a raw air caught my throat, for a haar had stolen stealthily from the Firth up over the Lang Dykes, till the hollow below the great ridge of the town was blurred, mist hanging round it like a gray plinth, the Castle Rock set on it, a black and amorphous brooding shape. The unstable fog crept and curled fantastically. In a caprice of the wind it would lift for a moment, and a hundred eyes, the lights of the dark rampart above the valley, leaped into definition, to be as suddenly obscured, reminding me greatly of Westmorland, where the wind sweeps the mist around the fells as swiftly as the drawing to and fro of a curtain. The great mass of the Castle Rock might have been a ridge of Shap Fells, the swish of the ruffled ripples of the Nor' Loch the voice of a Westmorland beck.

But the present moment called. Casting all such romantic notions behind me, I went on, the horse *clomping* the wet road beside me, now and then giving my arm a friendly nuzzle. I had many tedious flounderings in the dark before I came to a part of the road where I thought it safe to mount. Even then I trusted as much to the good beast's intelligence as to my own horsemanship; but she jogged on steadily, and met with no mishap.

The weather changed its mind again; the wind ceased, and the rain, that up till now had been but half-hearted, grew to a fusillade. The sound of it on the trees and the stubble, steady and incessant as a stream, filled the hollow of the night. It was black dark. Not a star had I for company. I think I would have welcomed the Accuser of the Brethren had he appeared, but never a soul but myself was afoot on that sombre road. I could not see a yard in front of me. It was almost as though I had been suddenly stricken with blindness. Twice my horse stopped dead, flinching from the stinging rain. I dismounted again, for I could make no speed in the saddle. My thoughts were labyrinthine, leading me round and round the affair that had come into my life, but drawing me not a yard beyond conjectures and shaking doubts. But the mere physical effort of walking, the relentless assault of the rain, and the play of my muscles braced me, and gradually eased the disquiet of my thoughts. Added to this, I felt a subtle sense of danger, a premonition—and there was a strange joy in it—that I was soon to be in the full tide of life. The solitude, the dark inscrutable woods around

me, that were so silent, yet that I knew were full of lurking wild presences of the things that move by night, so far from daunting me, spurred me onward, so that with every step I took my courage mounted. At a turn of the road the voice of a swollen burn told me my whereabouts. I knew I was near the wood that lay south of The Garth, and in another half-hour I had reached it. I had not spoken to a soul except the Highland sentry since I had ridden out into the dark. I would have given something for Walter Irving's company.

Tethering the horse safely in as sheltered a place as I could find, I took the path into the trees, and, feeling very much alone, groped my way cautiously forward. The darkness was inky. The clamour of the rain on the branches drowned all other sound. I gained the coppice near the house, dived into it, and crept quietly to its edge. The dark prevented my seeing its outline, but I knew that The Garth stood in front of me. Straining my eyes into the darkness, at last I made out two very thin blades of light, faint, almost invisible, in the upper storey. They came from the shuttered window at the south-west corner. I lay on the sodden ground watching them, pondering over my next move. In truth, I knew not what to do.

In the city's heart, amidst light and voices and the environment of one's kind, my resolve had been shaped; but here, in the dark, tense solitude, lying in the undergrowth, with no company but my beating heart, face to face with stark actuality, I own to an alteration of my perspective of the business. Every moment that passed was paralysing my initiative.

A trifling thing roused me into action. A cold, wet hand touched my cheek, and I leaped to my feet, ice on my spine, to find that it was only a branch of a tree!

Ashamed of the trick of my nerves, I chafed the life into my chill hands, felt for the butts of my pistols, and went forward slowly step by step into the blackness. I had not covered six yards when my foot caught something soft, and I fell face downward on it. It was wet and hairy. Smothering a wild desire to yell, I pressed the muzzle of my pistol against it, and felt it with my free hand. It was a dog, from its size probably the great hound that had bayed at me on the day when I first saw The Garth. It never stirred, and I knew, somehow, and at once, that the poor beast was dead. The body was still warm, but I could find no wound, nor was there any trace of blood.

The chill significance of the discovery peopled the darkness with a hundred stealthy shapes. Something had happened, perhaps at the moment was happening, behind the mask of the gaunt house. Not a sound was to be heard. I stole forward on tiptoe, ears and eyes on the strain, and began a stealthy circuit of The Garth.

Starting from the west corner, I groped my way yard by yard close to the wall. My progress in the dark was infinitely slow; but when I turned the corner at the back I knew where I was. There was the path, and beyond it the stable out of which I made my dash for life. I waited and listened for long, but there was nothing to be heard but the weeping of the September night and the hollow voice of the sea.

Slowly I began again my circuit round the house, crouching till I came to the east wall—that is, the one nearest the entrance to the cave. I could hear the snarl of the shingle as the spent waves ran back. Another half-dozen yards and I should have circled the house, when I stopped dead. A faint and pungent odour reached me. I sniffed the wet air. Beyond doubt it wafted tobacco, and rank stuff at that; yet it was ordained to be the costliest brand imaginable for one man. Keeping very still, I made out a figure close to the pillar of the door. Every now and then he peered round him, his whole pose advertising wariness. Plainly, he was on sentry-go. Flattening myself against the wall, foot by foot I drew gradually nearer, and watched the watcher. Whether he heard me, or imagined he did, I cannot tell, but on a sudden he wheeled round, saying in a curious constrained half-whisper, 'Who is there?' and took a small lanthorn from under his coat. He drew the slide, and a narrow ray cut into the dark. As he held it above his head, his face, peering into the dark, was lit up, showing me as plain as in daylight his every feature, and above them a flaming red shock of hair. The watcher was the man who had brought me the letter to the 'White Horse'!

A cold torrent of rage lifted me, and threw me at him before he had time to turn. I heard the clink of the lanthorn as it fell, but I was at his throat before he could utter a sound beyond one gasp, and next instant I had him on the ground. I could see the whites of his eyes as I gradually throttled him. His hands caught my wrists, and for a desperate minute he strained at them. I held on to his throat, literally like grim death, for a cry would have roused his masters. He loosed one hand, and made a desperate clutch at his armpit; but it never reached the knife he sought, for I took one hand from his throat, just catching his arm in time to jerk it down under my knee, where it lay pinned to the ground, useless. Wrestling days in old Westmorland had given me—thank God!—mighty arms and quick resource. I had my hand back to his throat again, and never lessened my grip for an instant. Fully three minutes sped before I felt his other hand loosen and fall limply off my wrist. When I stood up panting, and put my foot on the smouldering lanthorn, a little convulsive shudder ran down him, and he lay very still. Not a word beyond his 'Who is there?' had been uttered, and I do

not believe that in the dark he knew who I was. When I bent down, a couple of minutes after, his heart had stopped beating.

I dragged the rascal's clay to the wall, taking a naked dirk (it was as keen as a razor) from under his arm, and, in a shudder of reaction and horror, sat down to get my wind. There was a measure of shelter in the pillared porch, and there I betook myself, and awaited I knew not what. The tumult of my thoughts took longer to steady than my breathing, but gradually I got command of myself.

Luckily the relentless beat of the rain had deadened all sound of the encounter; but one thing was certain. The man whom I had throttled was not alone. He had been deliberately posted where I found him, and was under orders. Even if I got inside the house—which was hardly possible, for the windows were all shuttered—I should be against desperate odds, in the dark, with unknown adversaries and numbers. There I stood, baffled as to my next move, when in a twinkling the decision of it was taken out of my hands.

A lull, sudden and welcome, lowered the pitiless voice of the rainstorm, and in it rose a single long cry, the despairing cry of a woman! It was not repeated, and the stillness after it filled my heart with unutterable apprehensions. I crept swiftly round the house again, my mind on a rack of impotent rage and anxiety. The barred and shuttered windows mocked my helplessness. A blind fury seized me as I came back to the porch. Come what would, I would batter on the door. The alarm would interrupt whatever was happening behind it. I felt for dirk and pistol, and swore that the sale of my life should be dear.

I was a couple of steps from the porch, on the point of swinging my pistol-grip on the oak door, when the shutter in the upstairs room opened, releasing a faint orange bar of light. I saw the figure of a man holding a candle over his head. The window opened a little, and a low, sharp whistle came from the room. The signal was repeated. In a cool moment of inspiration, singular enough in my burst of elemental passion, I gave an answering whistle as like it as I could. The candle was waved once, and the window instantly shut. I heard the shutters barred, and the place fell into darkness again. I surmised that I had been taken for the sentry, and, as it turned out, I was right. With a grim thankfulness I knew that he would lie quietly enough where I had put him; and, holding my breath, I went to the door.

My wits, though working well enough in one way, must have been incredibly dull in another. In my knowledge of the guarded, shuttered house, I had never thought of trying the door; and now, grasping its handle, I found to my surprise that it opened easily! I slipped inside.

RUSSIAN COOKERY.

By E. H. PARKER.

I CONSIDER that the Russians, as a whole, are distinctly ahead of us in cookery. I do not deny that at the Holborn Restaurant or the Criterion you can get the finest cookery a reasonable man needs for a price absolutely derisory compared with what you would pay for the same style in Petrograd or Paris. I may parenthetically add that the head-waiter in the Holborn grill-room is a Russian. I am only speaking of the bourgeois classes, whose mass gastronomical interests are far more important to the nation than the whims of a few smart people. In the first place, slovenly and dirty though the Russians in some respects are, they are (from our grimy English point of view) lavish with their table-linen, an ample supply of which is furnished with every meal or snack taken at hotel, restaurant, or on steamer, railway, concert, or beer-garden tables. No such pathetic sight is witnessed as that of a parcel of English 'tabbies' or boarders solemnly folding up their napkins for reproduction meal after meal possibly for a week. In clean Finland, however, at purely Finnish inns, the guests *do* put by their napkins for future use in a sort of alphabetically arranged post-box or pigeon-hole cupboard. In the next place, as a rule every dish is cooked fresh for each order; at station waiting-rooms, where there is no time for this, an ingenious system of heating apparatus keeps the steaks, chops, sausages, pies, or what not, not only hot, but visible; you can lift the lid and inspect the viand, the price of which is marked. On board steamers or in restaurants this system of special ordering certainly wastes time unless you have the foresight to order some time beforehand. The waiter is always rushing about overworked. My plan was to write out exactly what I wanted, and say, 'I shall sit *here* in twenty-five minutes.' The linen, &c., will probably be laid in twenty minutes, and serious operations begin shortly afterwards.

Tea is always excellent in Russia; a penny a tumbler—beetroot sugar and a slice of lemon included—is the lowest price at a 'pot-house,' where also the tea may not be quite so fragrant; but ten copecks, or twopence-halfpenny, is the usual cost at 'decent' places; a tip is expected besides. It seems to be pure Chinese tea of fine quality, and in the wholesale tea-shops the minimum price seldom appears to fall below two shillings and sixpence a pound. I understand that Indian tea and Ceylon tea have now obtained a foothold, at least in south Russia; if so, they may be used as blends. In any case, the popular English decoctions of boiled, often either par-boiled or twice boiled, coarse, rank leaves resembling tannin, mixed with milk, or, worse still, preserved milk, are totally unknown. The usual

way of making tea is to pour boiling water over a pinch or two of leaves placed in a tiny teapot, and from this 'stock' a couple of tablespoonfuls are poured at any moment, hot or cold, into a tumbler, boiling water being added. In hotels samovars are now giving way to larger teapots containing the required boiling water; but in inland towns a large samovar of, say, a gallon capacity, with a small teapot, can always be ordered up into the bedroom at the cost of sixpence, and the guest is welcome either to put his own tea in or to buy a 'ha'p'orth.'

This plan of calling for a samovar at once is excellent for other reasons: Russia, and especially the neighbourhood of the metropolis, is notorious for its villainous water; in Cronstadt I noticed numerous street notices advising people on no account to drink 'raw' water, as there was a risk of cholera and typhus. In Petrograd itself the law now compels every restaurant to keep outside in the street a tapped cistern or large covered can of boiled water, with a cup attached, so that poor people may get a drink gratis. The guest at an inn who pays for a bed can thus fill from the samovar his own bottle with water that has been boiled, and carry a sufficiency for the day about with him. At many towns I have seen grimy workmen catch hold of buckets of drinkable water being carried to purchasers, and take a swig; others are allowed by the easy-going carrier to pour a quart or so into their greasy billycocks, from which their thirsty companions gather round to drink greedily. The good drinking-water so universal in England is rare anywhere on the Continent, except in Switzerland, Scandinavia, and (sometimes) parts of Germany. It is always better to carry about one's own small pan and 'spiritine'; when the spiritine is exhausted, the tin pots can be filled with methylated spirit. However, *no* one by preference drinks water in Russia, and every one needs tea, so the danger is minimised. A Finnish captain told me that on his first arrival in Petrograd he was sick for a fortnight after drinking one single glass of what looked perfectly clear river-water, which, besides, tasted quite good. Beer is cheap and good both in Finland and Russia, especially the Riga beer; but, in the absence of that, the beer from the great Kalinkin brewery of Petrograd is quite good enough, and, unlike those Hamburg imitations of 'Pilsen,' &c., does not leave a bitterish thirst behind it. Foreign wine is impossible in Russia owing to the excessive duty; English whisky costs from twelve shillings to fifteen shillings the bottle; but Russian (Crimean) wines are reasonably cheap, the chief defect from the English point of view being that,

whether 'port,' 'sherry,' 'claret,' 'champagne,' or what not, they are all much too sweet.

Cigars are also impossible, being both bad for the money and monstrously expensive if smokable; at our Petrograd hotel they were offered (if asked for) at from ninepence to three shillings apiece. Every one in Russia smokes *papyrosses*, or tubed cigarettes, more than half of which is tube. They are made smaller and much cheaper than they were a generation ago; and perhaps it is as well that they are rubbishy things, being too wishy-washy to do much harm. But the litter from abandoned tube-ends is apt to be unsightly. In Finland the cigars are both good and cheap. Coffee is usually made well, certainly *always* better than in Britain, where the stupidity about coffee-making is even greater than the stupidity about tannin-drinking. A tumbler of black coffee is usually accompanied—in Russia, not in Finland—with a slice of lemon; but it is much more expensive than tea, and, except in Finnish, Estonian, and Scandinavian ports, it is not drunk by the lower classes. In the restaurants very good imitations of Vienna, French, Turkish, and other coffees are served up; but they are rather expensive. The same may be said of chocolates and cocoas, which are practically unknown except to the great towns. Since the war began the word 'Vienna' is *taboo*, and you must say 'coffee and cream' in ordering, instead of 'Vienna.'

One of the noblest dishes in the world is *schtschi*, or cabbage soup. Just as the Scots honour porridge with a plural, and say, 'They are very good this morning,' so the Russians consider *schtschi* (a formidable word to look at, but only needing two letters to write it in Russian) to be a feminine plural, but of what original singular I cannot say. The word *schtschi* can be easily conquered by saying, 'Hush! children!' and mentally eliminating the 'hu' and the 'ildren.' If this soup is ordered it is always specially made, or, if much be called for at a time for many people, it is at any rate served up piping hot from a seething and fresh stock. It usually consists of a lump of meat floating in cabbage soup, and sour cream is generally added by the eater himself. Bread, black and white, appears to be served gratis with all meat dishes ordered, and a bowl of *schtschi* with quarter of a pound of black rye bread soaked in it is really a sufficient dinner by itself. Another, not quite so universal or popular, but equally delicious, soup is *borschtsch* (four letters), which occasionally 'runs into,' and to me is then indistinguishable from, its rival; but the cabbage is not there, and the soup is usually red, while the other is often as green as spinach. But there are many varieties of both kinds, and I am not yet sufficiently well up in the language to set about a thorough investigation. The Russians are also very strong on hot *piroziki*, a term which includes small puddings and pies, dumplings, and

roly-polys. There is one particular restaurant or confectioner's in Petrograd (Phillipoff's) where the *pirozki*s are particularly cheap and good; and it is often difficult to get a small table there. The street shops are remarkably strong in fish, both fresh or salted, or smoked and canned. One sees very little ham, and no bacon; in fact, bacon, as distinct from ham and lard or pork-fat, seems an unknown comestible anywhere on the Continent. Cheese is remarkably scarce and expensive at all Russian restaurants, and it is not the custom to wind up a meal with sweets and cheese as with us. A 'portion' of cheese—too much—usually costs a shilling; but there is a way of 'dodging' this waste of money by ordering a *Butterbrod* (one of the preliminary appetisers), consisting of a small slice of bread and just as much cheese as we usually eat after dinner, carefully preserving this *zakuska* until the end. These *Butterbrods* of caviare, cheese, ham, tongue, salt-fish, &c. are cheap, ranging from twopence to fourpence. A *portia* of caviare—of which there are many kinds, fresh or otherwise—is of course even dearer than cheese; but taken in *Butterbrod* form it becomes quite cheap; in fact, one can dine very well on *Butterbrods* and *pirozki* without ordering a 'dish' at all. The 'swell' hotels in Finland, such as the State Hotel at Imatra, of course serve up things in international style, and charge accordingly for the show of refinement; but one can live excellently at a beautifully clean Finnish hotel for half or a quarter of the money. I strongly recommend the Turisten Hotel Suomi at Viborg. Laid out on a table in the centre of the room are twenty or thirty hot and cold dishes, practically the same all day long, though slightly varying according as it is breakfast, dinner, or supper time. There are piles of plates; heaps of forks, knives, and spoons; dishes of butter (excellent and lavishly offered), cheese, (Dutch and local), sliced 'German' sausage, hot sausages, hot potatoes; breads, black, yellow, and white; ham and fish (cooked, uncooked, smoked, fresh, or dried); beetroot (unusually fine), good radishes, stewed apples, berries, and other 'sasses' of the Yankee kind; slices of chicken, mutton, beef, buckwheat-cakes, oatcakes, and so on. Each guest solemnly and silently walks in, takes a plate and fork, and 'looks round,' spiking half-a-dozen things as at a New York 'free lunch'; he then takes his place at a small table, devours his 'swag,' and returns as often as he likes to recharge. Milk, buttermilk, *krass*, and (at side-tables) tea and coffee are supplied gratis. No one drinks water, though the water is as safe in Finland as it is vile in Russia. A selection of the above *hors d'œuvres*, which correspond to the Swedish *smörgasbröd*, is really quite enough to eat; but at dinner a tureen of soup is also placed on the table, besides a 'serious' hot dish, and something sweet of the tart and pudding ilk. There is no waiting what-

ever; the neat-handed Phyllises gravely replenish the central dishes from time to time, and also remove soiled plates, knives, &c. from the small tables. The general effect on one's nerves is that of a Y.M.C.A. and Y.W.C.A., an American 'bean-feast,' or a Quaker's jollification. In Russia the food is more expensive, and *zakuskas* are charged for extra as a 'course;' as also at the 'foreign' hotels in Finland. On the lake and canal steamers in Finland not only are the *zakuskas* thrown in on a handsome scale, but several 'set dishes' are served as well at breakfast, dinner, and supper. As a rule, the whole

of one's food, ashore or afloat, in Finland need not cost more than from three shillings to five shillings a day, even if one sets out to have a 'burst' each meal; in Russia the cost must be doubled, and things, though good, are not so 'natty.' Except near Russia—for example, Viborg—the tea is not particularly good in Finland; but the coffee usually is, and always can be (if insisted on), made well. The local market stalls generally sell hot coffee everywhere in Esthonian-Finnish regions; in such widely separated places as Reval and Joensuu (north Finland) I got a cup of excellent coffee for a halfpenny.

A BAYARD OF THE BUSH.

CHAPTER III.

THE meeting between husband and wife struck the keynote of their future intercourse. Courteous, immensely considerate, entirely apart, the spectacular effect of their attitude on Al was not impressive.

'I presume that's the dandy style people way-up do things. Looks about as sensible as a couple of native companions dancing and performing.' He, however, admitted that, though the fine finish of their action struck him as ridiculous, it had its point of utility. 'If folk can't be natural together, it kind of eases things.'

As soon as he had sufficiently recovered, Mortimer Chesney still further eased things by practically disappearing—a daily withdrawal in work about the plantation.

So much did this element of artificial ease enter into and control the position that Jan, with infinite relief, found it possible to consign the debris of unformulated hopes, inarticulate desires, and vague day-dreams metaphorically to the dust-bin. Led by she knew not what blind will-o'-the-wisp, she had entered into a contract without fully understanding its conditions. Yet, as an honourable woman, all that remained was the fulfilment of those conditions. She was grateful to Mortimer Chesney for tacitly releasing her from the further necessity of bringing to their marriage any air of commonplace unity. It was not, she found, difficult to understand what impulse had led him into marriage. Glancing, as she did, at the daily routine of the homestead, under the coarse and crude supervision of Miss Irene Smithson, the bare unloveliness of it was enough. With all his remoteness, he was not a man devoid of observation. She recalled how quickly he had gathered her position in Laura's ménage; how his silent glance had gauged the conditions she had found so intolerable. It was impossible that he should not have realised what sort of a home was his at the mercy of any chance untrained girl. His very furniture betrayed an unformulated conception of charm and beauty,

in rough surroundings, breaking into sporadic silver candlesticks, expensive leather bindings, and a gidea wardrobe. The importation of a wife had been merely another of his tentative efforts to evolve order out of chaos. He desired nothing of her but the service of an efficient housekeeper.

Jan had that feminine instinct, fast dying out in the emancipated spirit of latter-day women, for domestic detail. She could fill her days with infinite satisfaction in the meticulous ordering of the home, being one of those rare beings, a genuine housewife. There lay at her feet a rich chance in the chaos reigning in Mortimer Chesney's house; yet she commenced operations with what looked like disaster. She dismissed Miss Smithson.

It came about in this simple manner.

'Servants at home,' said Jan, regarding the blue blouse with extreme disfavour, 'always wear black in the afternoon, with white caps and aprons.'

'Servants! I reckon Australia hasn't come so low as that. I guess I'm your help, Mrs Chesney,' retorted Irene. 'I look a fair skyte in black,' she added, 'and I'd like to see meself in a cap!' She seated herself easily, her hair in curling-pins, and about her waist an unclean apron. They were in Jan's bedroom. 'I ain't had a sight of yer trouser yet,' she continued. 'I guess you started a glory-box same as I done. I kep' it under me bed, an' got together a sight of things before any chap come along. There has been one young fellow; but he didn't act white, so I gave him what for, and sent him off his tracks. I've got me clothes, though, all ready for the next. Let's see yourn.'

Jan coldly bade her arise and return to her neglected work. 'And,' she added, 'remember another time to stand when you speak to me.'

Miss Smithson's honest surprise lasted only until her sense of outrage emerged. 'You! You! Coming along as if Australia were the dirt under your feet, wantin' to put me in caps,

an' orderin' me to wear black, an' a-tellin' of me to stand! If that isn't just about too much! I'd let you know that me father's got a selection all so good as this, an'—"

'You can return to it, then,' interposed Jan quietly. 'At once—to-day.'

With some disquietude Jan sought Al. He turned on her such a look of consternation that she felt dismayed.

'Of course she's got to do a shift, if you wish it,' he said. 'But how about the work, Mrs Chesney? Out here servants don't hang on every wattle-bush. Irene's a bit of a schicer, but I thought she might shape.'

'She would never shape,' said Jan decisively. 'Hasn't that man Jamieson a wife at the men's quarters? Can't she come? Oh, do help me!' she entreated. 'I don't want to worry Mr Chesney.'

'Mr Chesney? Mort?'

Something within him leaped at her appeal. She found it possible to come to him with her little troubles! He felt he was throbbing and tingling with unnameable feeling. He was digging over one of the beds in the patch of garden, and she, on the veranda, leant towards him across the low rail. His glance sought hers boldly. She had come to him; not to Mort! It was not the first time either!

'Don't you start in being too tender with Mort's worries, Mrs Chesney. He'll not die of that complaint. If I didn't drag him round, and force him to worry, he'd never get farther than the inside of a book. There's Mother Jam,' he went on dubiously. 'But she's a pea-eater, she is; a regular bush-whacker. She ran the homestead before you came along, when Mort and me were alone. We weren't men those days. We were crawling curs! I kind of got permanently humble; and as for Mort, I always reckoned it was Mother Jam drove him to get married.'

He recognised his tactlessness on the instant, but he continued readily, 'Tis that way with Mort, Mrs Chesney; better know him first as last. He's got to be drove or led most always; and then once in a great while he'll start in on his own without so much as a word!' He pushed his hat back. 'Now, I tell you,' he went on capably, 'the boss can go along to the Desert; the men are spoiling for a job; and I'll start in wattle-stripping, and locate myself in the hut up Hawker's Gully. That'll relieve you of us men until you see the track clearer. I'll fix it up about Mother Jam meanwhile, and first chance I get I'll rush the township for another girl.'

The Desert was a recently acquired bit of country which they were clearing of scrub and timber. To it, at Al's instigation, Mortimer Chesney silently betook himself. Al himself departed for Hawker's Gully, and Mother Jam surged into the homestead, her imposing bust dominating its vacant spaces, its rooms and

passages echoing with a shuddering rattle of dislocated boards beneath the impact of her ponderous tread.

For some weeks Jan was almost happy, almost content. Occupation relieved the strained tension of feeling, but to a much greater degree her husband's absence contributed a lifting sense of freedom. She was sufficiently versed in the ways of the world to carry herself easily in his immediate presence; but out of it she flushed and paled before every movement. Little intimate household sounds—his step on the veranda, the closing of a door, his voice giving an order to Jamieson or speaking to Al—drove the blood to her face and set her heart beating. Now she gave herself entirely to the work of rearranging the homestead, comparatively at peace.

Al came over from the hut frequently, and hammered open her cases, and unpacked china, linen, and wedding presents, entering with zeal into her designs. He knocked up shelves for her books; he hung pictures and curtains, and imported from Wangabool linoleum, and paint, and rugs, and a whole wagon-load of culinary necessities for the transformed kitchen.

They had tea together on these occasions on the veranda, furnished now with rugs, and gay cushions, and matting, and shade blinds—teas which to him were a revelation of unimaginable daintiness. He looked on the gathering charm she was flinging about Mort's home reverentially, as in part but an inadequate expression of her own delicate fineness. He became absorbed in her in a manner entirely different from his first questioning curiosity. She was not to him a woman to be discovered; still less was she Mort's wife.

Wrapped in the mystery of her sex, her purity, her ignorance, she was not a being, she was an essence—all that he had ever yearningly imaged forth to himself when feeling, during lonely vigils on dark nights, under starless skies, with nothing between him and the blue vault above, the only sound the movements of his horse hobbled near at hand, with sightless motions of the spirit for the ideal and gracious. She was love, and beauty, and womanhood incarnate.

That she was simply the woman he loved he did not for some time recognise. When knowledge came to him he met it with a strange constriction of the heart, mingled with stranger elation. In his own words, he was 'up against it!'

He had not thought much of Mort all this time. He thought of him now, savagely, brutally, with the instinct of the depredator, with the blind lust of primitive desire, defending his attitude with the scorn in which he had always held Chesney's frigid abstraction. 'Him! as dumb as a mopoke on a fence, with his nose in a damned book!'

He struck his hands together at last with a

strong gesture of remorse and renunciation, going back to Jan, sewing on the veranda, to say that he couldn't stop for tea, and wouldn't be able to spare the time to come over again for a goodish spell.

'Oh Al!' she said pleadingly. She had never called him anything but Al. He had brushed aside all formality from the outset.

'Couldn't answer to the name of Walker, Mrs Chesney, not no more than old dog Spicer here. I've got a great name on me, sure enough. My mother guessed, I reckon, by the look of things, that I should have to fight my way clear through life, so she called me after some old conqueror, 'way back in past times—Alexander the Great. Mort's read him up to me, and all his wars and battles. And there it is. Alexander Walker, at your service. But no one gets any farther than Al.'

He answered her steadily now with something of a conqueror's spirit, while his wild, untamed senses shivered at the nearness of her and the sweetness of her appeal breaking persuasively on his own name.

'I reckon, if I started in to do it, I'd make her understand the difference between me and Mort,' he thought passionately. He leant against a veranda-post to stay the quivering of his body, and turned his eyes forcibly from her face.

'You've most done settling in,' he said carelessly. 'Jamieson's fetching out the new girl to-morrow. Scotch she is, and pretty bony, with a face like a pick-axe; but doc's wife, Mrs Robertson, guarantees she's a warrior to work. Knock spots sideways off that schicer Irene, anyway, and better than coming down to a chinkie-chin-chin Chinaman! It's time I put in some graft at my own job.'

'Oh, stay!' she urged.

'What sort of company am I for you?' he asked lightly. 'Guess you've often wondered how a white-coated gentleman like Mort came to be knocking around with a man like me? Ever hear how me and Mort met?' he added. 'It was one time coming back from Melbourne with only a shilling in my pocket, nowhere to go, and nothing to do. Stuck up in the middle of a paddock, with only a good suit of clothes and a new pair of gaiters. I was dead proud of those gaiters, but would have given them, and my very soul, for a square meal. I came after

a bit to the old "Twenty-Mile," a public-house out from Korina Station, twenty mile from anywhere. I sauntered in and got a whisky—all I was good for.

"Haven't any biscuits knocking about?" I asked. They'll always throw in a few biscuits with a drink; and they planked down a plate of things as dry as a seven-year drought. I finished that plate, and that seemed the end of my luck. I camped out that night half-starved and all but frozen, nothing with me, not even a bluey—a blanket, that is—and next day I struck a bullock-team with two men, one an old grizzled bullocky, and the other a chap about my own age. He spoke kind of quiet and forceful—sized up the situation without a word too much.

"Been down to Melbourne, and done for your cheque?"

"You've struck it," I said.

"Any one knows what a spell in Melbourne amounts to. Haven't any money myself, but this chap's got a pound," he says, meaning old grizzly. "I'll borrow it from him."

'We was both older before I met that man again and paid him back. His was more the spirit of old times. You could walk the main transcontinental route from Adelaide to Port Darwin and starve all the time nowadays, and hardly find a man to shout a drink. But that chap was Mort, and that's his kind. He'd help any one, and pass on without giving things another thought.'

Jan, with a constriction of the heart, recognised her own position—some one Mortimer Chesney had casually helped, and thought no more about.

Al's quick discernment was apparent in his next remark. 'Don't you be in a hurry to think that you know the last there is to Mort.' He straightened himself. 'Life looks mighty different, Mrs Chesney, when there's understanding. It's up to the woman to do most of it,' he added. Turning abruptly, he 'cooeed' to Jamieson for his horse. A moment later he was in the saddle, galloping with a loose rein, his shapely head bared in farewell.

Jan leant back, listening to the *cronk, cronk, cronk* of the frogs. 'I do not even understand myself. How can I understand him?' she thought with a recurrence of restless questioning.

(Continued on page 330.)

THE GULF OF FONSECA.

By EDWARD PERRY.

ONCE upon a time a gentleman named William Parker called at places on the north coast of Honduras, an example followed by many lucky enough to keep ahead of the sheriff in modern days. A few months after Mr Parker's visit one Francis Drake made ducks and drakes

of the commerce of the great South Sea, particularly along the shores of the Provincia de Guatemala.

About that time certain gentry who followed the high seas hereabout pursued, with diligence and often with grim determination, ships that

sailed from Caribbean ports, with design to carry silver and gold from the New World to ever-yawning pockets of Church and Court and courtiers, not to say courtesans, of old Spain. Señores Blauveltd and Drake, Morgan and other free-traders of this Mediterranean of the Western World, took more ships and cargoes, more haughty *dons* and proud *doñas*, more frightened *daniselas* and their diamonds, than seemed right or proper to folk who had Spanish prejudices about such matters. Morgan and others of like principles carried their attentions across that pinched-in waist of Colombia, where ships now pass from the Caribbean to the Pacific. Those venturesome visitors made what some Americans term 'rough house' in what was in those days a busy and a rich city, but is now crumbled masonry amid mounds that were homes of people most of whom are dead.

Those visits, with other happenings, may have given reasons enough for making Señor Don Francisco Valverde de Morcade an investigating committee. He was to examine and report upon all ports along the coasts of Central America, from Nombre de Dios round to Panamá city. He was to cross Honduras from Puerto Caballos due south to the Gulf of Fonseca.

Lest a reader fail to find these names on maps of to-day, it may not be amiss to say that Nombre de Dios ('Name of God') is now known as Porto Bello ('Beautiful Port'), and is a very few miles east from the north-west end of the Panamá Canal. Puerto Caballos ('Port of Horses,' dead ones at that) is now Puerto Cortés.

Three hundred and twenty-four years ago on the 24th day of August 1914, Don Francisco dashed his *rébrika* or flourish after his signature to his *Razón y Parecer Acerca de la Mudanza de la Navegación del Puerto de Nombre de Dios al del Puerto Caballos*—in other words, his reason and opinion about changing the ocean trade from the one port to the other named. That report may be an old story; yet it may have interest to-day, not alone because his Spanish is delightfully queer, but because he describes at much length the Golfo de Fonseca, and the conditions about it, as they were then. Moreover, the Gulf has lately been, is now, and will be, the subject of no little lively discussion. For it is that broad and beautiful landlocked bay wherein the United States would put a naval station should the republic of Nicaragua make with Uncle Sam a bargain that would be of no small benefit to both.

Don Francisco's report will lose, by any translation I can make, the charm of his phrasing; but the substance of the part relating to the Gulf is, in effect: 'The port and bay of Fonseca is on thirteen degrees and a half.* The bay makes by the border to the east of a point that they call Coqibina,† and by that to the west the

point of Martin Lopez; from the point of the Coqibina to that of Martin Lopez there are eight leagues; within the mouth of this bay are two principal isles that are Miangola‡ and Comixagua, which make the port; they are with the point of the Coqibina north-north-west and south-south-west; and with the point of Martin Lopez north-east-south-west, it makes three channels that by whichever of them can enter whatever great ship, there are ten fathoms in the least deep of them.'

In paragraph 57 he says: 'The east part of this bay is less deep, and there is another channel from the point of Mazatepeque to the mangroves of the mainland of Choluteca,§ where are not more than two fathoms or a fathom and a half at high tide, and at low tide the major part is left dry, and in some pools little more than one fathom, which makes this a safe port.'

Cosiguina stands—or so much as it left of itself about eighty years ago—on the southern edge of the broad entrance to the Gulf. It held its head high—some three thousand five hundred feet high—until one September day in 1835. It may have swallowed a little sea-water then. At any rate it suddenly coughed up dust enough to darken all this part of Central America for forty-eight hours. When that pall settled down it made a blanket twenty-four feet thick over all the south part of Honduras. The tale was so writ, gravely. Some of that dust fell on Jamaica, some nine hundred miles to windward; and some covered the face of the Pacific a thousand miles westward. Ships of that day logged the story that they had slow and hard tasks to work their way across the mat of pumice Cosiguina spread many feet thick and eight hundred miles out on the great South Sea. That was something of an outbreak! Bogotá wrote at that time that she heard the sound of that blowing up; and she sits more than a thousand miles from Cosiguina.

Cosiguina is but one of a big family of hot-headed ones. They stand in an almost straight line that runs from Panamá to Alaska. In Nicaragua sleeping volcanoes sit along the edge of this old-time strait that ran across the whole width of Nicaragua. Momotombo, at the head of Lake Managua, still waves his plume of snow-white far out over the plain toward the city of Leon. Ometepe is an almost perfect cone, standing with its feet in Lake Nicaragua; and it has flamed up within recent years. Cosiguina has been quiet ever since she indulged in that spasm of eighty years ago. She has carried her head lower—some thousand feet lower—and watches over bay and entrance, and the flat black plain stretching away to the south-east and the Caribbean.

From Fonseca to the Caribbean runs that gap in the stone wall that fences the Pacific on three sides. Here the Pacific tides raced to and fro,

* Latitude 13° 30' north.

† Cosiguina.

§ Choluteca.

in frolic with the waters of the Atlantic, through who knows how many cycles of centuries? Slowly a dam was raised to stop this play, and to make the Lakes Managua and Nicaragua and a long bed of mud that reaches from the Atlantic to the Gulf of Fonseca. This is one of the best of the very few natural harbours between Cape Horn and San Francisco. Strategists might figure better than I could its value as a naval station, especially as the guardian of the world's greatest ship-canal, a few hundred miles away. From the Gulf to Puerto Cortés a railway might be easily built, for no difficulties occur in the two hundred and forty miles of its line. It will be part of an almost straight line between the site of the proposed naval station and New York. It might be a valuable asset if the canal should be endangered or damaged by any hostile force. Reason exists for believing that this naval station could be made the end of a canal that might use Lakes Managua and Nicaragua. No hills need be dug through to make such a canal, and its axis would lie in a direct line between the Caribbean and the California coast. It might shorten the sailing distance between Atlantic ports of the United States and their Pacific ports at least a thousand miles more than that distance is shortened by the Panamá Canal. At Brito, the projected end of the Nicaragua Canal, is an open roadstead; at Fonseca a perfectly sheltered bay might give entrance to such a waterway.

Certain agitators have managed of late to stir a lot of Central Americans to 'demonstration' against the project of establishing an American protectorate over Nicaragua, and many *actas de protesta* have been published against it, against the ceding of the canal rights, and against the leasing of the site for this naval station. It is reported that Salvador lodged a formal protest of like purport with the Government at Washington.

My efforts to learn the nature of any or all legal reasons for these protests against the leasing of the Nicaraguan part of the Gulf of Fonseca brought to light nothing better than an assertion by a lawyer that the constitution of fundamental law of Honduras says, in effect: 'Honduras is a State separated from the republic of Central America. In consequence it recognises as a primal necessity its return to the union with the other nations of the dissolved republic. To that effect the legislative power is authorised to ratify definitely the treaties that they may have to fulfil with one or more States of the old federation.' *

* *Constitución Política de la República de Honduras, de 14 de Octubre de 1894.*—Art. I. Honduras es un Estado disgregado de la República de Centro América. En consecuencia reconoce como un necesidad primordial volver á la unión con las demás secciones de la República disuelta.

Reports say that eminent lawyers of Costa Rica were asked to prepare and present such a protest, and declined upon the ground that it would be an impertinence unwarranted by the facts. Perhaps they gave due consideration to the circumstances that Nicaragua and the United States are independent and sovereign nations, and as such have a right to enter into any treaty with each other if it would not encroach on any right of another nation. It has not appeared that Nicaragua even suggested that she would lease to the American Government any foot of territory pertaining to any other nation. Possibly the Americans would not rent were she to try so to lease land not owned by her.

While the agitators were kicking up this dust, perchance to hide other schemes, a survey was made of the seventy-two mile link of the Pan-American railway which will skirt the Honduras coast of the Gulf of Fonseca. It will probably pass within a few miles of the proposed site of the naval station, and continue across the flat black plain to the railway now running from Chinandega to Lake Nicaragua. The republic of Salvador has meantime leased the island of Mianguera, just inside the entrance of the Gulf, to an English concern. A free port is to be established and maintained during the next half-century. This seventy-two mile link in the Pan-American railway will soon give quick access to the great cities, to the thousands of factories, and to the hungry millions of the United States and Canada. The free port should become a depository and exchange for a rich commerce which would never come here but for such warehousing as it may give; and the naval station would, in addition to other benefits, give to the people of Honduras, of Nicaragua, and of Salvador each month many thousands of dollars of American gold that would never be seen there but for that station.

These seem to be merely three forerunners of the many great changes that are likely to come to this Pacific coast as a consequence of the opening of the Panamá Canal. If these peoples of Central America can rid themselves of that oriental fear, that jealousy toward the foreigner, which so long kept Japan, China, and the colonies of Spain closed against progress and prosperity; if they can rid themselves of domination by agitators who strive to rouse fear and hatred of the great nations now leading in discoveries, inventions, and the application of these for the benefit of humanity; and if they show a moderate degree of business sense, then they may easily gain more in a decade than their forebears gained in many centuries.

E este efecto, queda facultado el Poder Legislativo para ratificar definitivamente los tratados que tiendan á realizarla con uno ó mas Estados de la antigua Federación.

NOTES ON THE WAR.

That most delightful form of literature, the gay, modest letters of officers and men at the front, as well as the racy narratives of our splendid Tommies, who carry with cheerful and imperturbable courage the British Empire on their backs.

LORD ROSEBERRY.

I tell you this war is the most appalling crime that was ever committed; and if only English people, living in their unharmed luxury at home, could catch a glimpse of the utter misery that exists where fighting is, and has been, they would be absolutely horrified.

AN OFFICER OF THE ROYAL FIELD ARTILLERY.

LITERATURE has reflected, as in a mirror, the herculean struggle in the great war; and morning, noon, and night the reading of the average individual has largely—all too largely—consisted of newspapers and periodicals which chronicle its progress. No wonder that a doctor at the front asked a friend to send him no more illustrated periodicals, as he had enough of the real thing before his eyes. An officer with a pocket volume of Kipling in the trenches had never opened it. Life, he felt, was too strenuous and exciting to contemplate imaginary scenes and situations. 'Everyday incidents far outweigh anything that has been written in fiction.' As there has never been such a war before, so neither has there been such a mass of literature bearing on the subject of war, in the form of maps, pamphlets, and books. About two hundred books, pamphlets, and sermons bearing on the war were published within the first six months. A wave of moral thoughtfulness has passed over the community, which has shown itself in unselfish working and giving for the soldier on the battlefield, the sailor at sea, and relief funds. The Bishop of Carlisle narrowed down the war to a death-struggle between the gospel of human brotherhood founded on God's fatherhood and the philosophy of a superstate founded on power and oppression. The names of the Kaiser, of Treitschke, Nietzsche, and Bernhardi, as those who sowed the seeds which have borne such bitter fruit, have been freely bandied about in newspaper, on platform, and in pulpit, all of which facts reveal the British nation stirred to its depths in self-defence. Germany has only too faithfully revived and carried out the ideals of Frederick William I. and his son Frederick the Great, whose *Confessions* were recently published. He says: 'The true religion of a prince is his interest and his glory. What man of honour would ever make war if he had not the right to make rules that should authorise plunder, fire, and carnage?' Again: 'If there is anything to be gained by being honest, let us be honest; if it is necessary to deceive, let us deceive.'

According to Clausewitz, 'war is an act of violence which in its application knows no bounds.' And Germany's war programme, according to Schellendorf, was the absorption one after another of all the provinces which neighbour on Prussia. 'We will successively annex

Denmark, Holland, Belgium, northern Switzerland, then Trieste and Venice, finally northern France from the Sambre to the Loire.' The sentiments of Norman Angell are well known. He exposed the misconceptions of national and selfish self-interest, of militarism, and the supposed benefits which force was able to secure.

In spite of the fine things said by Tennyson and Ruskin or Professor Cramb in favour of war, the sentiment of the Irish soldier who said, 'I don't think this killin' is the will of God,' is more in line with the eternal truth of things. So are the protests against war in that remarkable book, *The Crime of War*, by J. B. Alberdi, a former Argentine Minister, and in that powerful story, *Disarm*, by the late Baroness von Suttner, President of the Austrian Peace Society. In her book we live through some bloody pages of Austrian history. The writer points out how the ideas of military glory and the exaltation of soldier-heroes prevailed in her early reading. She also shows that 'shot and shell blast not only the ramparts and forts, but also the entire social fabric of family and finance.' Further, she says: 'What is most astonishing to me is that human beings will bring each other into such situations of agony; that men will not swear before God that war shall cease; that, if they are princes, they do not break their swords; and, if they have no other power, that they do not, in thought and words and deeds, devote themselves to the one passionate cry, "Disarm, disarm!"' Carlyle's picturesque paragraphs on the futility and devilry of modern war, at the beginning of *Sartor Resartus*, will be remembered. Then we have those who exhort us not to believe that to kill militarism in Germany will usher in a thousand years of peace. Of these, Professor Ridgeway, mentioning the example of Greece, has warned us against giving a hasty credence to the dream of perpetual peace when military monarchs shall have fallen and democracy be universal. In a world of perfect peace, he believes humanity would perish from its own moral and physical corruption. Tennyson in his *Maud*, written at the outbreak of the Crimean war, is found arguing that war, for the England of his day, was a more ennobling state than peace:

Is it peace or war? Better war; loud war by land
and by sea,
War with a thousand battles and shaking a thousand thrones.
For I trust if an enemy's fleet came yonder round
the hill,
And the rushing battle-bolt sang from the three-decker out of the foam,
That the smooth-faced, snub-nosed rogue would
leap from his counter and till,
And strike, if he could, were it but with his
cheating yardwand, home!

But this is hardly what 'a snub-nosed rogue' of a civilian would find it safe to do against our present enemy, as events in Belgium have shown. John Ruskin, at the end of the third volume of *Modern Painters*, and in a lecture on war to the Royal Military Academy, Woolwich, printed in *Crown of Wild Olive*, grows eloquent on war and art, on righteous war and its sacrifices. Of the Crimean war he wrote: 'I believe the war is at present productive of good more than evil. . . . No nation ever yet enjoyed a protracted and triumphant peace without receiving in its own bosom ineradicable seeds of future decline. . . . There is no great art possible to a nation but that which is based on battle. . . . I found, in brief, that all great nations learned their truth of word and strength of thought in war, that they were nourished in war and wasted by peace.'

Lieutenant-Colonel Ernest Dunlop Swinton, D.S.O., R.E., the very capable 'Eye-Witness' with the British forces at the front, has pointed out that the great struggle passed through three distinct phases during the first four months. The first phase was represented by the great outflanking advance of the Germans and the retirement of the Allies, the second by our advance on the Aisne, and the third by a gradual extension northward of both sides to the North Sea, followed by the desperate attacks of the enemy on the northern portion of the allied line. Neither side had obtained a decisive victory, but each was striving to obtain that necessary preliminary to victory which consists in gaining the initiative. These operations on a front of about three hundred and sixty miles recall to 'Eye-Witness' the continuous lines of entrenchments and fortifications of former days. The Great Wall of China and the Roman Wall are examples. That part of Flanders where the British army is operating was in the early eighteenth century defended by the famous lines designed by Vauban, consisting of an elaborate system of dikes, canals, and entrenchments stretching across the low-lying valleys of the Scheldt, Scarpe, and Lys to the sea. The trenches of the Allies thus stretch from the sea to the west frontier of Switzerland, like a series of small towns linked together by narrow communicating trenches.

We have heard opinions of these from private soldiers, some of whom characterise them as altogether damnable; others liken them to rabbit-warrens, with men for rabbits. But are the men discouraged? Hardly; for one wrote home: 'I am very fit, very hungry, very dirty, and very glad I came out.' One, in allusion to the wet trenches, said: 'This is no longer called Flanders, but "Flounders."' Another name for the trenches is 'little wet homes in the sewer.' 'It is wonderful,' says another, 'when one is fighting for one's life how fear absolutely disappears.' Being asked what he thought of the

Germans, a British soldier replied, 'They are like flies; the more you kill, the more there seem to be.' A soldier was asked, 'What does it seem like to kill a man?' He replied, 'Just nothing at all. You get so frightfully excited that you think no more of it than of shooting a rabbit.'

Behind the firing-trenches is a labyrinth of intersecting communicating-trenches, support-trenches, and dug-outs for staff officers. Shrapnel and bullets scream and whistle overhead; if the tip of a finger is exposed it may be fired at; while trench howitzers and hand-grenades have also to be reckoned with. The occupants lie low and fire over the top of the trench, though they may not in the dark see any object to fire at. Frost-bite and rheumatism are added to the catalogue of happenings, with possible deafness from the artillery and bursting shells. Beyond are barbed wire entanglements. Between the lines of the trenches may lie dead French or Germans, without a soul being able to pass out to bury them. Above pass aeroplanes reconnoitring and signalling. Washing and shaving are impossible, and the men leave the trenches like miners coming out of a pit. The digging of these trenches and the relieving of the men who pass along the intersecting trenches are eerie jobs, being done at night. Lord Kitchener's opinion of this kind of warfare is that when an army of invasion has ceased to invade, when that army hides itself in trenches and fights at long range, it is doing nothing but waste itself.

A correspondent writes: 'While the infantryman sits in his puddle he may speculate upon the many forces which are working to destroy him. There is first of all the puddle; then there are the Germans in the trenches opposite, who may shoot him or bayonet him; there are the guns two miles away, which may bury him; there are the mines sapping underneath, which, unless his own engineers get there first, may blow him sky-high; and there is the most recent form of terror—the flying mine. This last device of science is perhaps the most terrifying. It is hurled from any distance less than five hundred yards by compressed air, and consists of a cylinder-shaped torpedo containing from twenty-four pounds to thirty pounds of melinite. When it explodes near a trench it makes a most nerve-shattering noise; when it explodes on a trench its bite is as bad as its bark.'

A great impression was made on the public mind by letters which were published telling what took place on last Christmas Eve and Christmas Day between certain German and British soldiers in the trenches. We give the German soldier's account first: 'Suddenly from the enemy hurraing was heard; and, surprised, we came from our mouseholes and saw the English advancing toward us, waving cigarette-boxes, handkerchiefs, and towels. They had no rifles with them, and therefore we knew it could only be a greeting, and that it was all right. We

advanced toward them about half-way. We were only two hundred metres from one another. The greeting took place in the presence of officers from both sides. Cigarettes, cigars, and many other things were exchanged, and even snapshots of both sides were taken. The English began playing with a football they had with them. On darkness descending both sides returned to their drawing-rooms, having promised that for the next three days of the holidays they would not fire on each other. This promise was given as a word of honour, and extended on both sides to the artillery as well as to the cavalry and infantry. The French lay a little farther away, and therefore did not take part in this. They were under fire the whole of the day by our artillery. We were able to move about the whole of Christmas Day with absolute freedom. It was a day of peace in war. It is only a pity it was not a decisive peace.' A piper in the Scots Guards wrote: 'On Christmas Eve the Germans shouted from their trenches, which are only one hundred yards from ours, in these terms: "A Merry Christmas, Scottie Guardie. We are not going to fire to-morrow; we will have a holiday, and a game of football." Our fellows agreed. Next morning, sure enough, the Germans came out of their trenches, and began to saunter over to ours unarmed. At this our chaps went over half-way to meet them. We greeted one another like the best of friends, and shook hands. You would have thought the war was at an end. We exchanged cigarettes for cigars, tobacco, &c. They brought over ever so many things as souvenirs. A German officer gave me a button off his coat for my cap-star. We were chatting all day. I was talking to a German who was four years in London. He could speak fine English. I asked him when did he think the war would be over. He said in six months' time. I remarked that they were getting the worst of it now; and he said that if they were beaten, it was taking four countries to do it. They said they were getting tired of it. They seem to be as well off as we are, and have plenty of everything. One German gave our officer a letter to post to a lady he knows in Essex. I had such a funny feeling talking to our enemy, who would seek to shoot us on the morrow; but there was another surprise in store for us. Next day they came over and stood up on the trenches. We could walk and go where we liked. . . . I must say some of them were

very nice fellows, and did not show any hatred, which makes me think they are forced to fight.'

The poet seized on this incident and wrote:

Not all the emperors and kings,
Financiers, and they
Who rule us could prevent these things,
For it was Christmas Day.

Oh ye who read this truthful rime
From Flanders, kneel to say:
'God speed the time when every day
Shall be as Christmas Day!'

Another thing of note at Christmas was a recital by a captain of the Royal Artillery of Dickens's *Christmas Carol*, and three hundred men had to be turned away from the place in which it was held because there was no room. 'All through the dialogue,' said the officer, 'the men (I could feel it) simply sat breathless, hoping against hope that Scrooge would turn up trumps. And then, at the last words, "And therefore I'm going to raise your salary," there was an extraordinary outburst of relief—laughter and spontaneous applause.'

Professor Wilkinson sets down that 95 per cent. of the men killed and wounded in all the wars of the last hundred and fifty years have been struck by bullets, and about 4 per cent. by shells, leaving 1 per cent. by bayonet and the sword or lance. In the present war the shell has vastly increased its share, as it has largely been an artillery duel, in which the Allies, at first outclassed by the German artillery, later even gained superiority. It was the experience of a member of the R.A.M.C. that the great majority of the wounds on the British side were caused chiefly by shell and shrapnel. Bullet-wounds healed rapidly by first intention, unless a bone was struck or penetrated. The effect of shrapnel varies, sometimes making holes or huge lacerations. Shrapnel is named from its inventor, Colonel Shrapnel (1803). It consists of a thin steel case, divided into two compartments; in the front compartment are many rounded bullets, powder, and a fuse. A private soldier said that the only thing that affected our troops was 'that cursed shrapnel; 50 per cent. of our casualties are caused by that.' If every bullet in a battalion of four companies hits a man, it has been calculated that this would put one hundred and seventy-six thousand enemies out of action, this being the number of bullets carried by a battalion.

NEW ZEALAND'S TUATARA.

By R. W. REID, New Zealand.

NEW ZEALAND'S fauna possesses many unique and remarkable characteristics. While mammals are few, birds are plentiful. Indeed, New Zealand's avifauna has been de-

scribed by authorities as probably the most interesting in the world. There are the flightless kiwi, weka, and kakapo parrot; also the very rare takahe. The last-named is known as the *Notornis*

hochstetteri, and also as the *Notornis mantelli*. South, on the rim of the Antarctic, on the Auckland Islands, a duck is found which appears to be near to the stage when its wings will be incapable of flight. A much-discussed bird is the kea, which is found in the South Island, invariably in greatest abundance on the slopes of the Southern Alps and in their numerous craggy spurs. The kea has an evil reputation among flockmasters, it being accused of killing sheep. Over nearly the whole of New Zealand the varied clear metallic notes of the huia can be heard in the spring and well into summer. Then there is the wry-billed plover. The two last-mentioned birds are notable by reason of striking peculiarities in their bills. The bill of the male huia is short and straight; that of the female is curved, pliant, and long. In the case of the plover, on the other hand, it has the distinction of being probably the only bird whose bill is turned considerably to one side. The giant moa is extinct, and fears exist now that the sweetest singer of all New Zealand's birds, the tui, may have been heard for the last time. The Government last year despatched officials to search the interior of the larger forests and other solitary places with the object of, if not capturing the tui, making sure that it continues to exist. But up to the present time no tui has been discovered, though both Maoris and whites living in quiet and isolated districts declare that recently they have heard the tui's well-known silvery notes.

New Zealand has native bees and ants, dragonflies, beetles, and several representatives of other orders of insects. The katipo spider, which lives usually on or near to the seabeach, is the Dominion's one poisonous creature. Very interesting is the *Peripatus*, an ancient type of an invertebrate, which survives in New Zealand. It is found, however, in parts of Australia, Africa, South America, and southward from the Malay Peninsula.

The tuatara, however, far excels in interest every other member of New Zealand's wonderful family of living creatures. It may be briefly described as a lizard-like creature, the only surviving representative of the order *Rhynchocephalia*, otherwise extinct. The tuatara is found in no other country but New Zealand. Its nearest ally is *Homæosaurus*, whose remains have been found in Jurassic rocks in Germany. Unfortunately it has been largely destroyed—almost entirely perhaps—on the mainland by wild pigs, cats, and dogs. But dotted here and there around New Zealand are many small islands which at one time, it is apparent, formed part of the mainland. Upon many of these islands and islets the tuataras now find a comparatively safe place of abode.

The Dominion Government last year, in response to appeals from scientists, and from many who deplored the threatened extinction

of the tuataras, called for reports from officials—mostly lighthouse-keepers—who were in a position to furnish accurate information. There were doubts concerning the actual numbers of the tuataras and as to where they were to be found, about the dangers to which they were subjected, and as to how they were to be most effectively preserved. The reports sent in to the Minister of Internal Affairs have proved to be fairly comprehensive, and charged with details of considerable scientific value.

Dr Benham, F.R.S., Professor of Biology and Curator of the Otago University Museum, Dunedin, was conspicuous among the men of science who expressed the opinion that every possible effort should be made to save the tuatara from the fate of the moa. He would extend protection not alone to the tuatara, but also to the kiwi and the kakapo. 'The tuatara, or sphenodon in zoological works,' he wrote not long ago, 'is absolutely unique. As you are aware,' he goes on to state, 'there is nothing like it anywhere on the globe. It occurs only within the limits of New Zealand. It has become extinct on the mainland, and, I gather, is diminishing even on those islands on which a few years ago it was fairly common. It is indeed a surviving fossil, for in order to find anything like it structurally we have to go back to very early geological times. It is of immense interest to naturalists, for it combines in many respects peculiarities of both the crocodiles and turtles, which are now so definitely distinct, but which have descended from ancient tuataras, so that it is the most ancient reptile on earth.'

Dr Benham, in further discussing the need for protecting the tuataras, observes that naturalists all over the world, from Britain to Japan and the American continent, look to New Zealand to preserve, if it be possible, this last link with the past. The tuatara, according to this authority, is the only land animal which passed over into New Zealand from the continent of Asia before these southern islands were isolated from the continent—an isolation that has never been broken. In New Zealand the creature survived, while it was becoming exterminated long geological ages ago in other parts of the world. Its survival was due to its freedom from enemies until the fatal introduction of the pig by Captain Cook, and the later unfortunate introduction of cats, stoats, and weasels 'by ill-advised people.' These animals, if not feeding on the adult tuataras, attack the young and devour the eggs.

That the tuataras on the islands have suffered from enemies seems to be fully established. One correspondent, a naturalist, states that in the early 'nineties he lived for some time on Stephen's Island. In those days the tuataras were so plentiful there that if any one went out of doors at night without a lantern it was almost impossible to avoid treading upon them. This observer promptly discovered that the tuataras seem to

prefer for their homes the breeding-places of sea-birds. They can frequently be found in the burrows of the mutton-birds or petrels; often this correspondent met with what he styles a happy family, several petrels and tuataras living together in the one burrow. On several islands, the Brothers and D'Urville in particular, the tuatara's partiality for the sea-birds is well demonstrated. The sea-birds burrow and lay their eggs on one side of these islands only, and there are found the tuataras, and nowhere else on the islands.

Most of the reports bearing on the tuataras at the present time sent in to the New Zealand Government, chiefly, as stated, by lighthouse-keepers, are simple, unaffected documents. They, however, seldom fail to contain information of moment. Writing from Stephen's Island, in Cook Strait, on 30th September 1913, for example, the official states: 'The tuatara is now over its winter sleep, and can be seen basking in the sun on various parts of the island, but not in any great numbers. The tuataras, I observe, occupy the same abode year after year, and from it they seldom travel far.' This correspondent relates that, out of curiosity, he killed a large black spider and placed it close to and in front of a tuatara. For ten minutes he watched, but there was no movement on the part of the 'living fossil.' The watcher turned to leave, but immediately looked back, when 'no spider or lizard was to be seen. The lizard must have seized the spider and darted into its hole the moment my back was turned. I was simply astonished at the creature's quickness.' Yes; for usually the tuatara's movements are of the slow and meditative type. It calmly surveys mankind and the world around with its rather kindly-looking eyes. The tuatara possesses the further distinction of being a three-eyed animal, the pineal eye, on the top of the head, being now the sightless vestige of an upward-looking unpaired organ.

Mr T. F. Cheeseman, F.L.S., President of the New Zealand Institute, believes that almost all the small rocky islands a little distance from the eastern shore of the Auckland Provincial District have tuataras upon them in greater or smaller numbers. He has actually seen specimens from eleven islands, or, rather, groups of islands. He does not think that the tuataras have decreased to any great extent on these islands during the last ten years, nor has he any reason to believe that the young are not now in due proportion to the old. Mr Cheeseman has prepared a brief epitome of the reports to which I have already alluded and quoted from. From these reports we learn that the tuataras are seldom seen during the winter months—June, July, and August in New Zealand—but are frequently to be met with on warm summer days. 'They seem to enjoy a sun-bath,' writes one officer, 'and will stay for hours in the one position taking the

full benefit of the heat.' Hawks on some of the islands are destructive; after the dove petrel has flown they attack the tuataras. This embryo naturalist writes further: 'I would like to mention that I have lately seen tuataras coloured differently from the generality, they having green and bright-brown spots on them, especially on the legs and sides. This is probably their new coat, as I take it—judging by the number of empty tuatara-skins that are seen lying about—that they cast their coats like the crayfish.'

From the Brothers Lighthouse comes this interesting item: 'I was with others on Stephen's Island some years ago, when Drs Shawland and Thalnera (both of Germany) came there to study the tuatara. We were able to give them a fair amount of information, and they spent much time in making personal observations. Strange as it may seem, when we asked some of our New Zealand professors to come to the island they declined. They had got permission, however, to procure some eggs, which would enable them to study the development of the tuataras at their homes.' The same report has the following: 'I caught one or two, and on examining them I found that their mouths were closed. Therefore, I knew that they were recently hatched. They take from ten to twelve months to hatch, and their mouths are closed for quite a time after they leave the egg.' Here comes a curious piece of lore: 'The eggs of the tuatara, like those of the tortoise, are always laid on the same date of the month, year after year.' The eggs are usually deposited in a burrow, about a foot deep, covered with sand or earth by the female, and left. Heat and moisture are all that is necessary; but the eggs must not be exposed to the sun. An exposure of fifteen minutes to the rays of the sun, the New Zealand officials agree, is fatal. When hatched, the tuataras are about four inches in length, and they grow until they are about thirty inches long. The New Zealand Government has made it illegal to injure or kill the tuatara, and its removal from any of its haunts is strictly forbidden.

MY GARDEN.

A SLIP of tenderest green crowned at the verge
With a white belt of beauteous summer-snow;
Whilst fair lobelias lover-like emerge,
And lift blue eyes appealingly below.
Such is my garden, with the fragrance sweet
Of mignonette upon the soft winds borne,
Where bright carnations, clust'ring at my feet,
Salute with joy the glories of the morn.

When I have laid the tasks of day aside,
And pass within these sheltering gates of rest,
They welcome me with hands outstretching wide,
And lead me to the land I love the best,
Where Nature's soul in pity touches mine,
And, though the passers-by may only see
A simple place, yet, when the soft stars shine,
Among the flowers God holds His tryst with me.

GILBERT RAE.

Chambers's Journal

SEVENTH SERIES

THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday*.

IT is possible that when we have won the war, having spent more than a thousand millions of pounds upon it, and given the flower of our manhood to the guns, it will be discovered that the most evident result in the change of ways and views of life will be represented in a new attachment to the gentle happiness and contentment to be gathered at the fireside. And that will be a good consummation; it will nearly be worth a war. As I write, the saddest and most anxious winter our people have ever known is driving to its end with a gusty snarl at the light and the sun which strangle it, and a spouting storm or two for a final lash at unhappy folk in the streets ere the blue sky with its fleckings is open for the spring again. But if we must again have it with ourselves that the winter season, with its chills and glooms, is the chosen of the evil spirits when they are most active and vindictive (instead of which it is, as we know on discarding such chimerical ideas, the season of Nature's rest and as necessary and advantageous to her economy as any other), we should admit that in its defeat it is destructive, for now it leaves us resentful, the spring being spoiled. There is an incongruity about this new spring season, and I believe that even the coarsest and unkindest of the militarists of our enemy must feel some shame that he and his like have been the cause of it. Nature is now holding him up to contempt before the world. She is scorning him, marking him with ridicule, exposing his ignorance, his brutality, his lack of soul, his utter failure to comprehend the meaning and the greatness of life. She shows him that he is not man as he was meant to be, and he is out of place in a cosmos that, through many difficulties, is striving towards some mysterious good. Have you not seen the new dignity that our gardeners have assumed in these recent days? These are humble people in the winter-ridden months of January and February. They will hide away in out-houses, place things in order on their shelves, make pretence of doing all manner of things which we know to be unnecessary; and, from a feeling of very shame at their ineptitude, their uselessness, their inefficiency, the most sensitive among them will avoid being seen in

their gardens. How different is the autocrat of the flower-beds in May! Here is the season and the man. I have a remembrance of an excellent country gardener who has led flower-beds and buds through forty springs, and who for his importance and his silent, commanding way just now might suggest a Grand Duke Nicholas. And John of the spade and rake and his Imperial Highness have at least one other thing in common besides their austerity, and it is that each of them is directing the mightiest forces to a glittering consummation. How rare is the smell of the soil at the present time! And how the thrushes and the black-birds pipe, and those madcap starlings make their imitations always, be the conditions what they may! The spring has come again; Nature is happy in a return to her work of production in our northern lands; and the war of destruction goes thundering on. But it is not we who are blameful; Nature's contempt is for the enemy alone.

* * *

So the fires have been lit for the last time in the departing season of cold, and now there are screens set up before the grates. I have said that a result of the war may be a new attachment to the fireside, and it is the truth that not for a generation have the peace and contentment, the warmth and the glow, that belong to the fireside been sought and appreciated as during this dead winter; more in London perhaps than anywhere, but at all places more than before. Spirits of comfort have reminded the dwellers in the great town, with all their vagrancy and their restlessness and their ways as if they were always homeless, that they have a hearth. London has a hearth; the war has made it blaze, and the disconsolate have been led to it. No other such reversion to a domestic simplicity of the best kind has been known in our time. But in the early days of winter, when London was dark at nights, when hearts were heavy, when companions were cheerless, when the world was wrong, the unhappy man at last left the club and the hotel and the restaurant, and went home to the fireside as it had not been his custom to do. And those who were without companions for their own firesides joined themselves to the

hearths of others, and enjoyed the glow of the fire and the fellowship in this new domestic way that seemed so wonderful and good. Indeed, in this late winter our fires have almost become again, as once they were, religious symbols; we can nearly appreciate such mysticism of the ancients as led them to keep the sacred fires alight continually, and can understand why the old Greeks carried living embers away from the sacred hearths to distant lands. It is such a kindly, such a generous friend, it enters so genially into this happy arrangement for comradeship that we made for the homes in the time of war, that one might nearly forget fire's deadliness as an enemy, its bad inconstancy. So then and so now this hearth stood and stands for the domestic community assembled for the full satisfaction and enjoyment of kinship and close friendship, the knitting together of little units of mankind who, in a world that shrieks with horror, come closer to each other, feel in the good homely phrase that they 'have themselves,' and that in unity and faith they will stand or fall. I know that, much as it has been vaunted as his 'castle' (rate-collectors and process-servers being the most in mind), the average home of the Englishman in London has been a poor thing in recent years. Its richest virtues have been etiolated by the hotel habit, the restaurant habit, the travelling habit, the motor-car habit, and all the others. There were restlessness and detachment all the time, and the units of humanity with vague longings went about disconsolately in a state of separation. This has been good neither for the people nor for the State. A nation cannot be strong and noble without devotion to its fireside. It has often enough, and with tremendous truth, been declared that it is the instinct of home, the little family community, the men and women who cling together, that have made Britain what she is; but one dares to doubt if the sense of the happiness and satisfaction of the little community was as strong in Britain as in Germany before this war. It was weakening all the time, and in London more especially.

* * *

Now the war, which has hurled our thoughts and consciences back to elemental truths, has delivered us in joy to the fireside again, and the virtues of little communities are exalted and blessed. As the first crash of the war was heard, London and other places suddenly realised how the terrors and dangers of their loneliness had been much increased in recent times, how sadly had been neglected love and friendship, best instincts given by the Creator of human life. Then all at once the evil of this neglect was understood, and never through the medium of the general patriotism has there been among a large people such a kindling of warm

feeling towards each other as at the beginning of this war. It did not need the royal Prince to tell us that we must all 'stand by one another.' The manners of the people towards each other were immediately mended; courtesy became an art again; we spoke kindly to servants, as we should; there were smiles and cheery words for all; men found they could still be gallant; and women showed that sweetness, gentleness, sympathy, and sincerity were as good in them as in the English matrons of generations gone. We realised the value of love and friendship, of constancy and communion, and that they who made the least of them and not the most were false to the cause of happiness and advancement of the spirit. So precious above all things has been sympathy in the gloom of the world since the war began, and a test indeed the war has been. For what we are worth, for the good or the bad, the true and the false, we have all in our friendships been well found out. All this new feeling has received its highest expression in the closing in of real friendships (for the art of friendship has been neglected since the world became so fast and nervous and scattered) and in the simple gatherings of little communities by the fireside. And if the new spirit will endure, one very good thing will have come from the war. Sympathetic friends and a sparkling fire, and the world is still good enough. This we remember as we leave the winter and enter to the spring.

* * *

There is a point in regard to the new community, the recognition of the common interest, which seems to some of us to need bringing into acuter thought and pressing more closely upon the public judgment and conscience. War removes superficialities; it forces essentials into strong relief; it impresses the invincibility of eternal truths upon us. In the time of war, when life and property have not the same settled value as at other periods, and when, as we were enjoined by the Prince at the beginning of this struggle, we must all 'stand by one another,' avarice, greed, and selfishness descend from being serious human faults to the class of unnatural and intolerable vices. The great mass of our non-combatant community in this war has done its duty—done it well. Those who have lost the half of their incomes, or more than half, have still given a little of what has remained to their country for its needs. Most people have given; great sacrifices have been made. Many patriots have abandoned their peace-time ideas of pursuing commercial gain in the ordinary way; there are things now that matter more than the making and saving of money for the satisfaction of selfishness. Uncomplaining, the people have been 'standing by one another' very well indeed. But it is not

the same with all, and we can only think of some of the contractors for army materials, foods, and so forth, concerning whom so many painful revelations have been made or plainly hinted at, as simply traitors, who do not give to their country but rob it in its hour of greatest need, false citizens who serve the cause of the enemy hardly less surely and intentionally than spies, and upon whom some extreme punishment should be made. Some have said that an advanced commercialism of spirit is the curse of this country and of America. That may not be true, of Britain at all events; but it is unthinkable that we should permit among us persons who are little better than ghouls, fastening greedy claws in the bare flesh of our brave and wounded country. Why is so much mercy shown to the people who are false? Of the British it may be said that they do indeed forgive those who trespass against them. But, as apart from the dishonest contractor, in such a war as this, in which the very existence of the nation is seriously threatened as never before, when there is a tremble in the piles of our grand edifice of empire, when we must indeed all 'stand by one another,' is it right that many traders and manufacturers, even in the legitimate and thoroughly honest way of work and business, should gather enormous sums of money as extra profits from the war, directly from it and from nothing else, while other members of the community, equally worthy and as willing, are sometimes driven to want and poverty, and often much reduced in circumstances and convenience because of the mere chance that they were not engaged in an occupation or production associated with the war?

* * *

In times of peace Mr A., selling things associated with art and music and literature, made a weekly profit of ten pounds, and Mr B., selling boots he had made, gathered a weekly profit of twenty pounds; and the same with Mr C., who made cloth. Now, with the guns at work, the business of A. has nearly stopped, and his profit has decreased to two pounds, while with Government work on hand the factories of B. and C. are running day and night, three or four times the ordinary number of men are employed, and the weekly profit in each case is about one hundred pounds. (I take small and easily intelligible figures for comparison; we know the profits in these trades at the present time are colossal.) Does this seem right? Should the circumstances of war be thus permitted, as a matter of chance, to favour a few and make them wealthy beyond all peace-time dreams, while so many are, by chance again, reduced to want? And there is much evidence that the money-lust among a large proportion of the prosperous has eaten in, and that, taking in much, they give back little. Some of us do not like the thought

of people making fortunes out of this war, however honestly, or whatever their own good feeling and patriotic generosity may be. The nation is bleeding; its resources are being strained as never before; the mass of the people give, and give well and freely. It hurts our national conscience to think that instead of an even distribution in the way of giving and taking during the war, such as would do much to mitigate all difficulties, so much of what is given becomes concentrated in the accounts of a few. We do not like to think of a professional man leaving his stricken practice and going to fight in the ranks, while a manufacturer makes this year nearly as much profit as he has made since the South African war. And, more, there are young men in thousands and thousands who have asked themselves why they should go to the trenches and face the German guns and bayonets when the manufacturers and their young sons remain, all in attendance on their business, and give no more to the national funds than they would if their incomes were not so much enhanced. They are well within their rights; and those are honest, upright men, who love their country, and at the last resort, maybe, would die for her.

* * *

But the devil in man, which has been so well cultivated through the ages, will not easily be killed. One fears that no Utopia and no millennium will come up out of this war. There is in us British too much of the spirit of the *laissez-faire* which never will go out, and there is in the blood of humanity in general too much utter worldliness. We begin to realise these things better as the war goes on than we did at its beginning. Optimisms and pessimisms have been exchanged. But I see still on the stalls a little book with a brave cover on which are the words of the title, *The War that will End War*. We thought that in August, September, and October. War on such a gigantic scale as this, we said, could never be again; it was too terrible, too destructive, too inhuman, and too utterly useless. Were the world sane, we said, it could never do this mad thing again. It was a comfort to us as we sent our soldiers to the front that it had to be, and it was a fight for the security of all posterity; it would be the last. I fear our hopes have receded since then from that bright height. We have been looking round the world, searching into human hearts, scratching below the surface, considering motives, and watching the often callous working, as it seems, of human laws. We have seen how in the great mass of people greed and selfishness and vanity are, after all, the governing desires. At a breakfast-table in a country house recently a lady read to me a letter she had received by the morning's post from her brother, an American, in New York, in which he expressed his views

on the war and its developments. The phrase 'material interests' occurred about a score of times in this epistle, and I liked the writer for his frankness. Magnificent principles, the noblest ideals, are great influences in this war; but indeed the 'material interests' are also well involved. And do we not now, every one of us, appreciate the fact that the simplest and most terrible of all natural laws, that of the survival of the fittest, works with the same regularity, the same insistence, the same inflexibility and certainty as in the earliest days on earth and in the later times of the first barbarians? We are not now entitled to speak of those barbarians with pity and contempt. The fight for the survival of the fittest will always go on, the strong will crush the weak, and 'material interests' at the times of vast upheaval will often come before ideals. So we have less faith now than we had once that this will be the last of wars. The world will soon recover, it will become hopeful again, racial sentiments will become excited, the horrors of 1914-15 will be forgotten, the increased risks and terrors of future wars will cease to cause fear, and there will be more struggles for the survival of the fittest. Only, we think that there will be a longer interval between this great war and the next one than there has been between the great wars of the past. That may be the best achievement of the spiritual forces over human desires for a long time to come.

* * *

If, then, the millennium is not at hand, and if the spiritual forces are not yet strong enough to oppose successfully the 'material interests,' perhaps we have no right to expect that B. the bootmaker and C. the cloth manufacturer will give back to the national funds the eighty pounds a week they have drawn from them for war-work done, over and above the twenty pounds they earn in times of peace. Each man of the community will attend, as he thinks best, to his natural obligations and his own 'material interests.' It is simply a matter of the proportion of human greed and spiritual conscience. We cast no blame on B. and C. They are honest men. Yet by their simple human conduct, honest though it be, the needs of the State in a time of enormous danger are not well served. The danger is increased by the propagation of 'material interests' and the working of the worldly laws. Surely, then, the State by force should suspend the exertion of these influences until the crisis has passed and human nature can have its selfish fling again. Why should not the State by compulsion establish a code of national ethics for war-time such as would remove many hurtful anomalies? Why should it not make it law that utterly and completely we must 'stand by one another'? Let us in time of war, with our very homes in peril, have a little practical Socialism, State-made by force.

In peace days we talk of Socialism as a fine dream. More would embrace it did they not regard it as practically impossible, as the negation of ambition, and as contrary to that overwhelming law of the world, the survival of the fittest. However, if we cannot have Socialism when armies are idle, let us have a little of it now when the soldiers are so busy. Let us, with the force of the State, apply it to B. and C. for the full length of the war. We do not seek to establish a condition of equality among the people for the period; it could not be. Nor can we hinder loss and suffering. A. the artist is unlucky; he must bear his loss as best he may. We do not propose to take anything from B. and C. to give to him. But we lay it down as a principle, right and sound, that no citizen should make great profits directly from the State through the war, and that every man should and must be satisfied—and how well he should be satisfied!—if his earnings remain as large in times of war as in times of peace. The profits he makes from the State for the war-work he does for it should wholly or in very large part be given back to it for use elsewhere. We will, therefore, allow B. and C. each to keep twenty pounds a week for themselves, the amount they earned in peace conditions. We demand, their works being necessary to the State for manufactures for the soldiers, that they shall run them at such pressure as we require for the production of war-goods, and that either their profits from such work shall be given back to us or some scheme shall be devised by which all this extra work is carried through under national control and at national cost. At last we have it: at the beginning of a gigantic war like this the Government should consider its new and special needs in manufactured goods of all kinds—everything wanted by armies in war and sufferers from war influences at home—and it should then by compulsion take possession of all such factories of private firms as it needs for the production. Every factory should be taken over as a going concern; every machine of its equipment, every man of its staff, should be retained without a moment's hindrance to the even continuity of their labour and production. At the hour the State decides upon the temporary transfer, it has its line drawn in the account-books of the firm, the auditors do their work, the profits of the past twelve months are counted up, and then the State reckoning begins to be made. The firm receives for the ensuing period profits from the State working at the same rate per year as in the previous year for as long as the nation holds the factory, and the firm should be satisfied. We say that at the beginning of the war the Government should nationalise temporarily in this way every factory and business that it may need for its naval and military purposes, that the proprietors should be recompensed on the principle enunciated, that more factories

and businesses should be added as the need increased, and that at the end of the war the line should be drawn through the accounts again, and the proprietors, thanked for the service they had done, should renew their work in a free world, made healthier morally and more fruitful commercially. For a little while we should have had the most practical and useful Socialism. And, incidentally, having seen to it at the out-

set that in our judgment a fair wage was paid to the workmen, and that as the war wore on it was increased, if we thought it necessary for adjustment to any rises in the price of food that had occurred, we would regard any cessation of work in the way of strikes as an offence of the gravest possible character, something approaching treason, with a quick trial under martial law and no gentleness in the punishment.

THE BRIGHT EYES OF DANGER.

CHAPTER XXII.—LATE VISITORS AT THE GARTH.

THE hall was in black darkness, its floor covered with skins, soft to the foot. I waited for a tense minute or two. A low murmur of voices came from above, a laugh, and once the clink of a glass. Evidently the owners of the voices suspected nothing. I groped my way cautiously, found a broad staircase, and tiptoed up it slowly, step by step, holding my breath. A corridor at the top branched to right and left. The low voices still reached me, the sound coming at intervals from the left. Creeping along, I saw a light from the open door of a room on the right of the passage, the room where the man signalled from. The door was open about a foot. If I could only see inside! I crept along, and reached an alcove not three yards from the room door. The voices stopped. I shrank into the darkest corner of the alcove.

Suddenly the door was swung open, and a man, candle in hand, peered into the darkness. From where I lay I saw him plainly, a swarthy little man with a pale face and the ears of a bat. He wore the kilt, was under middle height, of poor physique, and the candlelight picked out a face as white as the cockade in his tricorne hat. He looked up and down the passage uneasily.

'It is the rain!' He jerked the words nervously over his shoulder to the invisible man in the room. 'There is nothing.' And again, 'It is the rain! But where is Andie? Why does he not come? Whistle again.' He blew out the candle, and went back into the room.

I heard the shutter-bar move, the window open, and once more the low whistle sounded. This time, unless the dead man near the door rose, I knew there would be no reply. My heart beat unsteadily for a moment. The door opened again, and the two, moving stealthily and on the alert, came out without a light. I heard the click of a pistol-hammer. They padded quietly along the corridor. The footsteps of one of them went down the stair, but where the other man was posted I could not tell. There was dead silence for a little while, a breath of cold air as the hall door opened, and in a moment the man came back at a run, all stealth cast aside.

He called out in a hoarse, shaking voice, 'My

God! Where are you? Something has happened! Come here, man! Something'—

I could not catch more of the gasped-out words, but I knew that he had found the late Master Prowler.

I had crept to the end of the passage, and was crouching in a dark corner at the head of the staircase. Somewhere in front of me, on the landing, I caught the slightest of sounds, the faint creak of a board. The other man must have hidden when his accomplice went downstairs. He was watching me, I knew. There was not an instant to lose.

'Stand, or we fire! The house is surrounded!' I shouted boldly at the pitch of my voice.

It was a desperate chance. They were at least two to one; but their plans had woefully miscarried, and the sentry's fate had set an edge to their nerves.

As for the man in the hall, he fled incontinently, deserting his comrade, the door slamming behind the coward almost as soon as my words rang out. Next moment something (a heavy oaken chair, as I afterwards found) came hurtling at me. Luckily it ricocheted from the wall, or my skull might have been split open. As it was, I got a blow on the point of the jaw that made me dizzy. It came just as I fired, and my shot went wild. I reeled for a second, and then plunged down the passage, for the man had doubled past me towards the room. I heard the door slam and the bolt shoot in the lock. Two kicks with all my strength burst the door. I fired my second pistol point-blank at the window, but I was too late. The bullet shivered a pane; and, leaning out, I heard running footsteps. Soon the rain deadened them. I closed the shutters, lit the candle, and surveyed the room.

The table had been overturned in the flight. Broken glasses sprinkled the floor, and a bottle of brandy, half-empty, stood on the chimneypiece.

The cool devils had miscalculated the extent of their leisure. A wrap-rascal (the name was never better earned), wet with rain, was flung over the back of a chair, and a wood fire had been lit. I reloaded my pistols, put one in my belt, and, candle in hand, stepped out into the passage, on my guard, but mightily pleased with

my performance. It was tolerably clear that I had little to fear from others of the gang; but I went downstairs and bolted the hall door.

Coming half-way up the staircase, where the chair that had so nearly been my undoing lay, I listened, but could hear nothing. Yet I knew that somewhere under this house of danger was the blind man Glenira, 'the Kestrel;' somewhere, too, Mistress Charlotte of the hazel eyes, and at the thought of the lone, despairing cry I had heard a mist swam over me. I knew now that I had lost more blood through the blow from the chair than was good for me. Thoroughly overwrought and unstrung, I called aloud in the silence; called I scarce knew what—her name with a sense of despair; incoherences; wild appeals. I wept. I think I prayed. No answer came from the gaunt house save mocking echoes along the vacant passages. The candle dropped from my hand. I fell into darkness.

When I came to myself I was lying where I had fallen. I was feeling cold to the bone, and very weak and dizzy; but the dawn's slow fingers were touching the windows, and the promise of day heartened me. I made my way to the room where the two men had sat, and helped myself to a good full measure of the brandy. It was 'neat,' and made my eyes water; but it did me a world of good, and after a rest I began to explore The Garth.

First of all, I went to the room on the ground floor where I had been imprisoned on my first visit. The door was open, and the room held nothing but its scanty furniture. But my ear caught a faint sound from above.

Hastening upstairs, one of my pistols ready—for I was to risk nothing in that house of alarms—I came to the door of the chamber. It was barred. I put my shoulder to it, and stood back on guard as it flew open, only slowly to lower my pistol in pity and amazement. Leaning against the wall opposite to me was a youth, pale, his dark hair clotted with blood, in an extremity of weakness, his chin on his breast. He never raised his head, much less looked at me.

'Ah! You have come, Cousin Philip!' I could scarcely catch the words, his voice was so feeble. 'You might just as well have finished me last night. Maladroit! But you always—always'—and on the word he fell insensible into my arms. Only then I recognised him—the youth I had seen on the morning of my escape from The Garth. I laid him gently down, ran for the brandy, and poured some down his throat. A patch of colour showed in his pallor, and he opened his hollow eyes to look into mine in bewilderment as I bent over him.

'You are safe,' I said. 'I am a friend.'

'*Ma foi!*' he said, looking at his blood-stained clothes, 'it seems that I am in need of one.' He sat up slowly and looked around him. 'Where am I?'

'In the house of The Garth,' I said.

'But of course! Yet—this room—I have never seen it! Ah, I remember! Last night Philip and another'—He broke off suddenly, and laid a white hand on my wrist, pitiful entreaty in his voice. 'Charlotte! Glenira! Are they safe?'

'I hope so. I think so. You must rest a little.' I was afraid he would swoon again, but I contrived to calm him somewhat, while I rapidly recounted my experiences of the night. When I told him of the flight of the two men he struggled to his feet, and stood shaking.

'*Juste à point!* But the others!' he said. 'The others! Come!' He made a lurch forward, leaning for support against the wall.

'You cannot walk. There is no time to lose,' I said, lifting him bodily, and carried him out of the room. He pointed along the passage. I was feeling weak and light-headed; but he was a feather-weight, as fragile as a girl, and I contrived to carry him to the head of the staircase.

'There!'

We came to a door, and I set him on his feet in front of it. The door was locked and keyless.

'Charlotte!' he called. 'Charlotte!'

There was no reply. He turned a stricken face to mine, a dreadful mute question in his eyes. I tried to force the door as I had done the last one, but it was of stouter make, and only after repeated attempts it gave way.

A form lay huddled on a couch. He was beside it in an instant, frantic tender incoherences breaking from him. The girl was lying gagged, and bound hand and foot. My heart leaped for joy, for her eyes were live and open. I cut the thongs with the dirk, loosened the gag, and together we chafed the poor bruised wrists and ankles. She was dazed and trembling, and, I think, only vaguely conscious of our presence.

'Charlotte!' he kept repeating, caressing her. To me, looking on, every moment brought bitterness. Bending over her, he met her eyes.

'You! It is you!' she said with a happy sob, her arms round him, as she drew his wet cheek to her own.

As for me, I got never a glance from her. I stood silent and unnoticed. For all knowledge of or interest in my presence that the two showed, I might as lief have been a piece of the room's furniture. I went out to the staircase, feeling, for my twenty-four years, suddenly very old and lonely. There I sat me down and waited with what patience I could, and—but for a very real throbbing pain in my head—like a man awakening from a dream, and haunted by its phantasmagoria.

Presently he came out. '*Grâce à Dieu!* She is unhurt, and will see us in a little.'

A key swung from his finger. He gave a hesitating glance towards it, and looked at me. 'My kinsman—it is painful—his mind—— But monsieur has perceptions of the most delicate. A stranger might alarm him.'

I bowed. 'I think that I understand. I shall wait here.'

He disappeared round the turning of the passage. I heard him unlock a door very gently, and I guessed that he had gone to see to the safety of the tall blind man. In a few minutes the key turned again, and he tiptoed along the passage towards me, a smile in his eye.

'What joy! He is sound asleep, and unhurt. The room is a secret one. Philip had no time to explore! I shall meet my good cousin some day, and then'—

He made a movement of his sword-arm. The lassitude had left him. A lustre shone in his dark eyes. The sprightly set of his trim shoulders, the poise of his head, the timbre of his voice, all bespoke a surprising reserve of nerve and courage for so slight a frame. An indefinable quality, breeding, was stamped on him. It is a futile business, I have found, to judge men and women by first impressions. Looking at him, I revised, unwillingly enough, my first estimate of him. I had set him down as a *petit-maitre*; but, in spite of his air, his delicate features, and light build, the youth radiated vitality like a rapier.

My sinews and muscles were well in their

way, and I had good cause to bless the lusty days in Westmorland that hardened and strengthened them, and gave me straight stature and breadth of shoulder; but beside him I suddenly felt clumsy and rustic. There was nothing lissome about me, and up till then I had rather belittled exterior graces in a man; but a girl's eyes bring about amazing breakages among the brittle opinions of youth. The rueful reflection that here was a gallant whom a woman might love to look upon and listen to forced itself upon me.

'We have scarce had a breathing-space, Monsieur—*mon ami*!'

I gave him my name.

'I am Bertrand Fondelle De Boux, of Bar-le-Duc in France, and I almost wish I had never left it. We have much to say to each other, I think. *Nom de Dieu!* what a night!' He passed a hand over his brow as if to brush out the recollection, wincing as his fingers touched the wound on his temple. 'But without doubt we both must overtake our toilette.' He took up a hand-mirror and looked at himself. '*Pouf!* I have the air of a cut-throat. Your story will keep. Soap and water first! Almost I feel as if I had not been clean for a week. *Allons!*'

(Continued on page 341.)

THE OPENING OF THE WATER-GATES.

By W. F. BATTEN.

THE very fortunately situated people of this country, whose ships are as free in wartime as in peace—save for a few small and slow steamers which are unable to escape from the submarine pirate—are naturally quite unable to appreciate the severe suffering caused by the strangling grip of the closest conceivable blockade. Yet this is what our Russian ally has been experiencing since the only access to the open sea from her southern ports was cut off by the closing of the Straits of the Bosphorus and the Dardanelles, the defences of which—until the present operations of the Allied fleets—have been hitherto considered to be too formidable for any warships to force. That dictum of the naval and military experts, however, no longer holding good, it becomes of interest to note what will be the economic effect of raising this most stringent of blockades—first upon our Russian friends, then upon ourselves; and afterwards to glance briefly at what the political and military consequences of the capture of Constantinople and her northern and southern 'water-gates' will be.

For months past the closing of these Straits has been bringing misery to millions not only in southern Russia, but in Rumania as well, because of the enormous amount of agricultural and other produce of the Russian Empire (and to a lesser extent of the Rumanian kingdom) which has been held up as effectively as if the Black Sea

had suddenly run dry. One of these commodities—corn—if available, would amply suffice to bring down the price of bread in these islands with a run. A Russian well posted in the figures of his country's export trade stated recently that at least thirty-three million quarters of wheat alone, besides very large surplus stores of barley, oats, and rye, with a large amount of beet sugar, are now available for export to this country. Much of the wheat, too, is of the finest dry quality, which will stand changes of climate and a long sea journey better than any other. The Russian wheat-crop of 1913 was an enormous one; and even that of last year, though smaller, left a good margin for the foreign markets. But, as Russia badly needed to transform this potential wealth into gold, it was suggested by financial experts that the corn might be transported *via* Vladivostok or Archangel. That looked very feasible on paper, but in practice proved quite unworkable; for though freights were as high as seventy-five shillings per ton for wheat from the Argentine, and only forty-five to fifty shillings from Vladivostok (which is now kept open in winter by ice-breakers), yet when two cargoes of Manchurian wheat, which is much drier than Siberian wheat, did reach this country, they arrived in such a condition that it was impossible to make flour from the wheat, because, owing to the intense

frost which prevailed while it was lying waiting shipment, it contained nearly 20 per cent. of moisture, and on passing through the tropics and the Suez Canal it became so heated that it was rendered unfit for human food. True, Archangel is but seven days by sea from Britain; but the limited facilities of that port are now required almost exclusively by the Russian Government for the import of war materials and stores, and are not adapted for handling large quantities of bulky cargoes continuously. The fact is that grain export from any of the northern ports is both difficult and expensive, they being farthest from the great grain-growing districts, whilst the route from the Black Sea *via* the Danube and Galatz is not a suitable one either. So far, therefore, as this country and the present season are concerned, the only key to the deadlock lay in the possibility of forcing the Straits; all the more so, too, because unscrupulous American operators have been manipulating the wheat market for the last three months. As to this, however, H.M.S. *Queen Elizabeth* (thanks to her fifteen-inch guns) proved the biggest bear in the American 'wheat pit' that ever appeared in 'the ring.'

But, turning from wheat to consider Russia as one of the principal sources from which we derive our oil for lighting, for heating, for fuel, for motor-cars, and that in the near future we shall have to look to that country for a portion of the enormous amount of oil-fuel we shall require now that we are adding oil-driven battleships and battle-cruisers to our other numerous warships propelled by it, it is imperative that the Russian surplus and that of Rumania should be made available. During the past nine months the oil-wells of Russia and Rumania have continued to produce oil wherever it was possible to procure labour, because the closing down of a producing-well is a very expensive, and often even a disastrous, measure, for, unless oil is pumped continuously, water (perhaps very deep down) may percolate through into the well and flood it past remedy. But a few figures will best give an idea of what the stoppage of Russia's exports has done for our oil-supply. The output of oil from the Russian oil-wells is about eight million tons per annum. Of this a considerable quantity, after it is refined, goes into the interior of the country, the rest being exported. In 1913 the total quantity of different oil products amounted to about five million tons; but in 1914, owing to the war, it was less than three and three-quarter million tons. Now, unfortunately, because the Dardanelles and Bosphorus were closed, the stocks have accumulated to the extent of one and a half million tons up to the end of 1914, whilst there is all this year's accumulations to add to that great total. Probably, therefore, more than two million tons of oil products are now awaiting the chance of

being shipped away. Further, some of the newer fields are increasing their production so rapidly that the storage accommodation available is insufficient.

The year before last Great Britain obtained from Russia about thirty-seven million gallons of different kinds of oil, about a third of it being petrol; but owing to the closing of the Straits last year only about twenty millions reached this country, whilst not a single gallon has arrived during the present year. But the plight of Rumania is still worse, for she has not her powerful neighbour's resources; and, with all her grain surplus left on her hands, her oil industry, which is assisted by her Government, and which had, after years of effort, become a lucrative trade, is now in serious jeopardy, solely because Turkey, while still at peace, and quite contrary to the conditions of the Treaty of Berlin (1878), suddenly closed the Straits. But though this serious state of affairs has attracted little notice at home up to the present, the 'enterprise' of attempting to capture Constantinople after destroying the defences of the Dardanelles, and to force the Bosphorus Straits in order to open a passage into the Black Sea, has aroused the greatest interest, none the less apparently that so few people understand the situation at the Moslem capital any better than they do the Russian and Rumanian one.

To commence with, Constantinople is no more a city than are its better-class Moslem inhabitants Turks, they being really Osmanli. There are three distinct cities that go to form what we call Constantinople—Stamboul and Galata (with Pera) on the European shore, and Scutari on the Asiatic, the first two being separated from each other by the waters of the Golden Horn, and both divided from Scutari by the Straits of the Bosphorus. Then, again, the inhabitants of these three cities are not even mostly of one nation, but practically of four; for, although the population of the Ottoman capital is estimated to exceed rather more than a million, there are scarcely more than four hundred thousand Moslems in it, as against about a quarter of a million Armenians and about one hundred and fifty thousand Europeans and other foreigners; whilst before the last war between Greece and her allies and Turkey there were also at least two hundred thousand Greeks, but their numbers have considerably decreased since then. Besides these, there are some fifty thousand Jews and a small number of Bulgarians. Constantinople is generally considered to be a most unhealthy place, the haunt of Asiatic cholera and the lurking-place of the plague, but as a matter of fact it is healthy enough; only, as it is, like Shanghai, subject to great and sudden changes of temperature, caution is needful in order to avoid chills. The fanaticism, too, of its poorer Moslem inhabitants, when roused, is not pleasant; but this is so in many of the Asiatic cities.

The beauty of this part of the world is un-

deniable, even when seen from the deck of a passenger-steamer. Stamboul always brings to one's mind some of Turner's gorgeous pictures; that is to say, it would have done so before the horrors of war enveloped the Dardanelles and its black shadow was thrown over the Moslem capital, marring the beauty of its scenery, its rich colouring, its wonderful architecture, and the priceless relics of its past. For from Seraglio Point almost to the Seven Sisters Towers, where before only a beautiful panorama of terraced roofs, domes and minarets, and groves appeared, there now stand out from solidly constructed batteries and huge earthworks the long muzzles of heavy German guns, before which the Teutonic sentinels pace to and fro; whilst the picturesque scenery, the white mansions, and dark-green cypress groves of Scutari have been scarred and disfigured by the erection of strong defensive works. In the suburbs of Pera the summit of the ridge above Galata is dotted with the palaces of the Ambassadors of Great Britain, France, Austria, and Russia, and the consulates of the smaller European States. But all the Embassies are now deserted except the Austrian one—which, however, the ladies have all left; the German Embassy, from which also all the ladies and children have been sent away, has been practically converted into a fortress. At Galata—which is as open at all times to attack by warships as to destruction by a fanatical mob—are the offices of the European merchants, for it lies close beside the harbour at the Golden Horn. The head-offices of the banks and the shipping companies are there also, though more than half of them are now deserted, the subjects of the Allied Powers, like the specie from the banks, having 'gone elsewhere for safety.' The British Consulate, with its court and prison, like the Seamen's Hospital and Sailors' Home, has, it is said, been commandeered by the Government. At Top Khana (the Gun Factory), which is a continuation of Galata, is the Arsenal, which occupies a wide terrace on the shore of the Bosphorus; here, too, there is a gun-foundry, with workshops and modern plant, where gun-carriages and small arms are turned out. The Artillery Barracks are close by; the dockyard, the naval arsenal, and the Admiralty are on the shore of the Golden Horn (the creek, by the way, with its curious branches, when shown on a large-scale plan, somewhat suggesting a stag's antler); there is a dry dock capable of containing pre-Dreadnought battleships; and there are depôts for naval stores and a naval prison. But whether or not these draw the fire of the fleets of the Allies on their appearance or subsequently, the writer cannot help thinking that certain other buildings here, or, rather, in Galata—far less conspicuous certainly, and even partially concealed—where a semi-secret slave-trade in young Circassian girls is carried on, and where it is said that up till

quite recently (even if now discontinued) a traffic was also carried on in Christian children, would be very suitable targets for the smaller guns of the Allied fleets if the buildings were only occupied by the slave-traders. The situation in the Moslem capital to-day, indeed, seems to recall that of another great Oriental despotism which had been 'weighed in the balance and found wanting;' for, despite the warning in letters of fire, where the flames of burning buildings, villages, and fortresses reddened the sky, the wealthy Osmanli inhabitants could not believe that the fall of the capital was impending, because they were told daily by their Government that the Allied fleets were driven off whenever they renewed the attack. So the cafés were filled, the theatres open as usual, and the questionable café chantants with their sly roulette-tables still crowded nightly. The capital's German masters, with their venal tools from the 'Committee of Union and Progress,' and their lady friends, continued to consume much champagne in the brilliantly lighted saloons, till suddenly the truth was revealed, and all realised the approach of a disaster final and irretrievable. Then panic reigned, the rich preparing for a hasty flight, the poor for an eventual armed outbreak. But here the situation in the doomed capital must be left, and the 'afterwards'—that is, the effects of the capture of Constantinople—briefly considered.

From a military point of view the consequences of the success of the 'enterprise,' as the Prime Minister has called it, may be immense. The obligation imposed by the success of the Allied fleets to occupy certain portions of the enemy's territory in force will probably entail increased efforts on the part of this country both in men and material, but the result will more than repay the price. Also, it must not be forgotten that the British Empire is an Asiatic as well as a European one, and that the necessity for the maintenance of our prestige will prevent any chance of failure. The Allies may have finally to settle accounts with at least five Turkish army corps, either four or six cavalry brigades, and a considerable body of irregulars (from these last the danger is negligible, except as to massacre); and there are German troops in and around the capital, who are said to equal a strong division in numbers, so that a quarter of a million regulars will have to be dealt with after the capture of Constantinople, together with the utter smashing of all the fortifications in both Straits and the clearing of the mine-fields. These regulars, having their backs almost literally to the wall, will fight well, and, after the Allied fleets have forced their way through, will most assuredly do their utmost to prevent their return. We shall therefore see the late Admiral Sir Geoffrey Hornby's advice (given in 1878) now taken, and the peninsula of Gallipoli occupied in strength after the Turkish forces are driven out

of it. The mauling of H.M.S. *Amethyst* was an illustration of the danger of allowing these to remain. Besides, the passage of the supply-ships for the fleets must be protected.

Constantinople, too, if the terrible scenes that occurred at Alexandria after the bombardment are not to be repeated on a much greater scale in the Moslem capital, must be held in force; for even if no general massacre of Christians such as the Bashi-bazouks are now perpetrating elsewhere takes place, and the capital escapes punishment from the battleships' guns or the fury of an excited mob and the rascally Kurdish irregular 'troops,' a revolution, with street fight-

ing, may occur later on. However, when the Bosphorus is held in force with the co-operation of our Eastern ally, a Turkish army threatening Constantinople will be cut off from all assistance from Asia, and, as Asiatic armies do, will sooner or later melt away. Moreover, the 'afterwards' of the capture of Constantinople will cause great changes in the political situation. Should the armies of Rumania, of Greece, and Bulgaria, and finally of Italy, join the Triple Entente Powers, they would bring about the total collapse of Austria, leave the vulnerable side of Germany open to attack, and so bulk largely as a factor in bringing about the beginning of the end.

A BAYARD OF THE BUSH.

CHAPTER IV.

GREAT wagons, loaded high with wattle-bark, lurched heavily across the dull perspective of yellow paddock in the direction of Wangabool. Jan saw them from her seat on the veranda. They projected an idea which brought her a ray of comfort.

'I'll go and see Al,' she decided, going to her room to remove the traces of tears.

For some days the north wind, laying a shrivelling touch on the shuddering pepper-trees and blackening the tender green of the young plantation, had flayed Jan's unacclimatised nerves, bared by the blasts of hot air, their quivering nakedness stung by the flying grit of driven sand. Withered and pulseless, she had fallen a prey to the most desolating depression, adrift in wastes of disillusion.

The distance to the hut in Hawker's Gully, she knew, was not great; the broad track cut by the wagons was sufficient guide.

She set out across the paddock with a renewed sense of buoyancy, though the marks of her recent stormy emotions shadowed her expression. The level stretch on which she moved, as a dot in space, swept on into far distance, monotonous, changeless, the impregnable calm of greatness in its vastness and all its oppression. Her eye travelled without sense of cleavage through an atmosphere so rare that not even a filmy haze clouded the meeting of heaven's translucent blue with earth's dim gray.

The ground was humped with tussocks of coarse grass, yellow and brittle, and scored by sun-dried tracks of cattle. Here and there blackened and charred stumps, where a tree had been fired, uprose, menacing and sullen. The rustle and whirl of myriad grasshoppers formed a tiny battery of sound at every step. Now and then the mellow call of the magpie or the hard clatter of the green parrot cut the stillness briefly.

Her first distressed sense of flat oppressive monotony passed, yielding to the subtle fascination of line and space. Here were no transient

effects of curve and colour, of light and shade. A shimmering transparency of heat alone veiled the uniformity of the spacious sweep outwards; and even this curled backward upon itself where sky and horizon met without defining line. The way led to an attenuated spur of the Ranges, dropping to a ravine of gray rocks clothed with a heavy growth of wattle, scrub, and wild-flowers.

The first gorgeous splendour of the Australian spring had passed, but enough remained to enchant her with a lingering flame of colour. Sweet-scented baronia, its little brown bells delicately lined with mustard-yellow, filled the air with a perfume as instinct with reserved yet penetrating potency as the scent of violets in a Devonshire lane. Yellow stars of Cape-weed carpeted the way. The fleshy blue-green of the pig-faced salt-plant clothed the crevices of gray rock, and everywhere surged the graceful pennons of the wattle. The scarlet head and gaudy waistcoat of the rozella parrot, a shimmer of metallic blue, beneath the spread of green wings, flashed from tree to tree with harsh squawks. Once a couple of jet-black cockatoos, a brilliant splash of gold tipping wing and tail, their crested heads held high, sailed slowly across the gully.

She came upon the little bark humpy forming Al's residence, and looked in at the open door, sagging on hide hinges. Its barren discomfort stirred her. A tin basin on a log and a lump of yellow soap in a jam-tin nailed to a gum-tree even brought a mist of tears to her eyes. She was swept easily nowadays by emotion. It arose now in a mingled wave of pity, tenderness, and pride before the endurance of these men. They seemed cast in the mould of Australia's greatness. The only other men she had known—Carstairs and her father, the dandiacal city man and the desiccated old soldier—took on the aspect of pygmies.

Beyond the hut the wattle grew denser, leaping to the summit of the ravine in a tangled forest, into which she passed, following a ragged

trail marked by lopped branches and naked trunks pallid as with the descent of some sudden catastrophe. Riven gray bark, its creamy lining, satin-smooth, curling and darkening before its exposure, lay bound in helpless bundles all around. The air was full of its pungent sweetness.

She came upon Al in the heart of a thicket. His flannel shirt—belted about the middle, open at the throat, with sleeves rolled above the elbow—showed the sinuous grace of his lithe figure and the smooth texture of white skin below the line of sunburn. He was stripping the bark from a wattle, ripping downwards with deft, powerful movements.

She watched, fascinated, the expert dexterity of his action. The sense which comes to women of the suave and compelling in any display of man's strength held her.

He suddenly became aware of her. A look, dominant and triumphant, flashed into his eyes. She had come. The imperious desire he had fought these days past had brought her. The blood throbbed in his ears; the sudden shudder of passion cooled the heat of his toil. Mort! What, anyway, did the flaccid detachment of Mort amount to? Who could consider Mort, holding in indifferent regard this which was to him as a consuming flame? He looked down at her.

The floating gossamer, turned back from the wide brim of her hat, framed her charming face in soft folds. Mort's wife! He knew that as yet no man owned her. To his experience, and in his roving, reckless life, he had known many women, and understood most of them; she had as yet yielded nothing to man, not even understanding, though its impending light flashed as a will-o'-the-wisp before her bewilderment. She seemed to him at the psychological moment when the chrysalis of dormant knowledge has slipped from its last filmy wrappings, its brilliant iridescent wings folded still, yet poised quivering for flight.

'I guess she doesn't know love yet, but she's about ready for it. Mine or Mort's,' was the simple savagery of the form the idea took in his mind.

He saw in the sweetness of her pallor the trace of recent tears. He was stirred to helpless, impotent rage. He swung his axe and lodged it in the heart of the naked wattle, and sprang to the ground beside her.

'You look like a Greek god,' she laughed.

'Greek god!' he exclaimed, excited yet controlled, launching into any topic that came first. 'What Mort's read to me about those gentry hasn't much struck my fancy. A set of swaggies with no decent occupation, and the customs of a black-fellow. Some of those way-back chaps Mort reads about are kind of heroes—and great. There's one Socrates—I can listen to any of his yarns; horse-sense every time, way above the Greek god sort. But, all the same, they seem to me kind of sitting round talking. I can't see any of them starting in to live. Come up to the

clearing by the hut, Mrs Chesney, where I can start a fire. We're going to have a good old bush camp together—quart-pot tea in a billy, and a bit of damper.'

He led the way back to the little humpy, talking all the time.

With the deft precision of the bushman, he built a fire and hung the tin billy on its tripod of sticks, and arranged their simple meal. His movements, the lines of his graceful figure, the blueness of his eyes, and, above all, the consoling charm of his ease soothed Jan's unrest, while at the same time it obscurely fed her emotion.

As to the man, he knew that without consummate care he was, as he expressed it, 'riding for a fall,' so nervous was his hand, so conscious was he of her, of himself, and of their enforced unity separated from the whole world in the sheltering silence of this wooded solitude. He was aware in every part of him that Jan was strung by some hidden disturbance to a pitch of feeling as dangerous as his own. His whole being swayed to the desire for revelation, while all his manhood spurned the shame of self-betrayal.

As for Jan, something within her was throbbing and beating. The vague, misty yearnings and languors of the past few weeks seemed to be gathering force for some terrific upheaval. She could have hidden her face against Al and implored the comfort of his understanding. He always understood. She had been so much alone with this sense of something immense for ever eluding her.

She rose to go, glancing about her. 'Why did you never tell me how sweet it all is up here.'

'Think so? Mort gets kind of blue-mouldy and poetical when he comes up. Seems much about it to me.'

With the impending desolation of her departure he turned fiercely to stamp out the remains of the fire.

'No bushy leaves anything alight,' he observed. As he spoke a smouldering stick snapped beneath his tread and flew upwards in a shower of sparks about Jan.

He sprang with the alert readiness of the man used to sudden hazards, and caught her to him, crumpling and crushing her light dress in his strong hands.

Beyond the necessity of her danger, for one pulsing second he held her, as a man holds the woman he desires, the blue flame of his eyes flashing downwards upon her. He felt the answering quiver of her body against his, and at that his arms dropped.

What had happened?

With mingled apprehension and expectation he looked for Jan's first revealing glance. Erect and pale, with the curious smile a man wears before the wavering balance of a woman's decision, with half-mad desire, with wholly desperate shame, he waited.

In that suffocating moment, while the con-

tagion of the man's passion shivered through her, while the blue flame of his glance scorched and seared her, there sprang to consciousness the knowledge she had so long sought. She knew now everything—all that had drawn her, all that had evaded her, all that held her bound.

The glance that met Al's tense gaze, so withdrawn from any consciousness of him or his passionate emotion, held in the swaying control of some power beyond and outside his, passed him, and yet, in passing, struck him as with the impact of a direct blow.

He lifted his head, alert, questioning, stung to the quick; the lust of the pursuer upon him, man's strongest impulse of dominance. He would make her understand! His whole body trembled as a dog's trembles held in leash within sight of its quarry. His glance swept her. The pupils of his eyes contracted, his nostrils dilating, he looked another man. Love can annihilate consciousness of time and space and material being. Al at that moment was perhaps as nearly an incarnation of its elemental indomitable force as a man can be.

'Mort!'

'Oh, damn Mort!'

About them there suddenly fluted a low, soft note of infinite sweetness, clear, detached as a miniature clarion.

It does not take man long to compass Destiny. There is always one supreme point of time immeasurably minute, immeasurably great; therein he makes his choice.

'Australian bell-bird,' drawled Al. 'Mort's favourite,' he added slowly. 'I'll see you to the bottom of the gully, Mrs Chesney.'

They took the downward trail in silence. Jan, walking as one in a dream, was passing out on to the paddock before she recollected Al.

'Oh Al!' she said, turning and giving him both her hands remorsefully. He closed them in his, and drew them slowly to his breast. His touch broke the last barrier of reserve between herself and her own heart. She met his steady blue eyes with a clouding mist in her own. Her tense feeling suddenly relaxed. Her breast rose and fell. She flushed deeply, and grew pale.

His heart seemed to stand still. 'I reckon you're missing Mort,' he said huskily.

Her voice broke in little pants. 'Oh Al! I want him. I want Mort!'

It was the first time he had ever heard Mort's name on her lips. It startled him. Very pale, he recovered himself. 'Why,' he said soothingly, 'it's no way to the Desert. I'll have Mort out of that before sundown.'

She shook her head, withdrawing her hands, and shrouding herself from him in her veil. 'Oh, that's no use,' she said, her voice sounding muffled and distant beneath its folds. 'It is I who am in the desert!'

She turned swiftly away, leaving him standing straight and silent where the wattle began its

upward ascent. Above his head a kooka-burra suddenly yammered its senseless laugh.

On the horizon the silhouette of a solitary horseman jogged up and down against the skyline. It faded slowly into the shimmering haze of heat and passed out of sight, dropping downwards to the south.

As Al rode into the Desert camp he saw Chesney sitting on a log, in his shirt-sleeves, his hands dropped listlessly between his knees. 'Mort's looking a bit played out,' he thought, his keen eyes taking in the air of dejection about the solitary figure seated amidst the forlorn and desolate country newly stripped of timber.

Mighty logs, like fallen giants, lay all around; and ring-barked gums, stretching a blanched reticulation of bare branches, with the effect of an agony of appeal, blasted into everlasting silence, stood dumbly awaiting the bushman's axe.

About some huts in the background men moved around a brushwood fire preparing supper. A fitful blaze from smouldering sticks served only to emphasise the solemn loneliness of the scene; the column of blue smoke belching upward in the still air suggested more some sacrificial offering to the outraged deities of the forest than the homely comfort of a good meal.

Al handed his horse over to one of the men, telling him to saddle-up Chesney's mare. 'The boss will be ready in a brace of shakes,' he said, striding off to his interview.

'Hello! Anything wrong?' Chesney questioned laconically.

Al kicked a chunk of wood impatiently aside. 'I've come after you,' he said, going straight to the point in his usual direct fashion. 'You've got to be at the homestead before sundown.'

Chesney made no movement, though the expression of his eye quickened. 'Nothing wrong with my—wife?'

'Yes,' said Al abruptly, 'everything, as far as I can see. You make me tired, Mort!' he broke out fiercely. 'A woman there alone, eating her heart out with longing and loneliness, and you sitting on the fence!'

'Going to drive that jump-stump plough of yours through the situation again?' asked Chesney carelessly. 'You don't understand how things are, Al.'

'I don't understand how things are with you, and that's God's truth; but I understand how things are with her. You bring a girl like that from all her topping people and her London society, and from the fine old crusted comforts of the Old Country, to what must seem to her the Back-of-Beyond. And you set her down with women like the Smithson girl and Mother Jam, and a man like me!'

Chesney smiled a little, though a worried gravity was in his eyes. 'Couldn't leave her with a better man, mate,' he said lightly. 'As to all that, topping relations, society, and so on, she's

above that sort of thing. Even I know that much about her. Way above it,' he said slowly.

'That may be,' returned Al. 'But,' he added firmly, 'she's up against something, and you'd best make tracks for home, and find out what it is. She's unhappy, Mort.'

Chesney lifted his hands, and dropped them inertly. 'You are sure?'

'Dead sure!'

At that Mort's calm broke somewhat. 'Unhappy, and tied up to me for life! I have known all along that she was wretched. I can always see the fear in her eyes when she stood by my bed that first day. I'd give my right hand to set her free. A man has no business to take a girl who, he knows, doesn't care a rap for him, and is only being shunted into marriage by her people. But, by God, Al! there's no sitting on the fence in my case. She—I'— he broke off.

'I'll send her back to England,' he went on, reverting to his usual manner. 'You have shown me that there is no use hoping. You saw from the first, as well as myself, that she was miserable—as miserable as a bandicoot!' He smiled. 'And yet I tried to ease things for her. I made some excuse, and left her behind after the marriage, so as not to rush her. I hoped she'd get accustomed to the idea. She is, as you pointed out, one of the "white-lily sort," and hardly knows what a man is. She has gone her own way since she came. The only way is to send her back to England,' he concluded, looking grimly on the chaos of fallen trees and heaped brushwood, as if he saw in their disorder the chaos of his own life.

Al's whimsical smile met his sombre glance. 'Oh lord! lord! lord! Mort. This comes of nosing round in books the best part of your days. You've taken a good few of my remarks to heart, seemingly; just take this one also. When a man loves a woman let him tell her. Tell her!' he repeated with a touch of scorn.

Chesney's unresponsive glance met his. 'Not a bit of use,' he said quietly, 'in this case.'

Al sat down on the log beside him abruptly. 'Now, Mort, just you look here. Tell her straight just what you've told me. Use or no use, it's her right. Wandering round in a heavenly maze of beautiful ideas isn't going to help you or her. Fine feelings, like fine fleece, have got to go through some handling. Go right back now, and have it out.'

Chesney gave an unmoved, impassive smile. 'It's not possible for you, Al, old man, to come within a mile of understanding how a delicate-minded girl looks at things. I don't myself. But I know enough not to pester any woman with talk of love which she cannot return, and doesn't want.'

Al sprang to his feet. 'Delicate-minded! What do you mean by that? Isn't she a flesh-and-blood woman, even if she isn't the forthcoming sort? It's just that kind we men slip up

about, waiting for a lead. Hasn't she shown you, if you had the sense to see? Look at the lovely way she's taken all this. No meaching, and pining, and miffing; but up against it, cooking, and dusting, and putting up her china and pictures and story-books, making your home as sweet as herself. When she rounded on that schicer Irene I knew she was a bonzar. An' always gentle and kind.' He dug his heel savagely into the ground. 'What do you suppose she came out to you here for? Shunted! A spirity girl like that isn't going to stand any shunting. What did she do it for? I've heard,' he added slowly, 'of a woman before now following a man out bush when he'd only his billy and a blanket. Why?' He looked down at Chesney, suddenly silent. 'Ain't you going to make no sort of effort to understand, Mort?' he asked sharply.

'God help me, mate! I understand only too well,' returned Chesney heavily.

Al moved a pace or two from him, coming back impatiently. 'I ain't one for poetical notions, or any such truck; but there's some things I'd want the woman I loved to tell me herself; what I reckon she'd fair desire you should learn only from her. But seems to me I've got to go back on her in this.'

He lifted his hat as if oppressed by the sultry heaviness of the evening. 'Mort, she loves you,' he said simply.

'How can you know anything about that?' asked Chesney derisively; though the man, looking down at him, saw he was moved.

'How? There's that saying of some Arab chap you're fond of quoting: "How can one tell whether man or beast has passed this way save by the footprints in the sand?" That's how I know. Life is the book I read; I haven't done no other studying.'

His eyes grew dark before the remembrance of Jan's face that afternoon in the shadow of the wattle.

'Does her voice give a little hitch and pant, and does her face go all red and white, and do her eyes look wet and wide when she says "Al," for instance? No, sir; not much. I've heard her say "Mort" like that,' he added slowly, thought drowned in the recollection of that supreme moment.

'Don't, man!' said Chesney, rising abruptly.

Al lifted a summoning hand to the man with Chesney's horse. 'You'll have to ride like the man from "Snowy River" to strike the homestead before nightfall,' he said carelessly, rebuckling a loose strap as Mort flung himself into the saddle. 'By the way, Mort,' he added deliberately, 'I've got a move on; going to clear—do a get. See? Macnaughten can take my place.'

Chesney reined in the plunging horse. 'What the devil do you mean, Al?'

Al laughed loud, and slapped the flank of the

rearing brute, which with a spring shot forward. 'Ride, Mort; ride for all you're worth! So-long, mate!' he shouted, flinging a hand above his head in farewell.

'The mare can easy do it,' said the stolid stockman standing by. 'No need for the boss to hustle.'

THE END.

THE MONTH: SCIENCE AND ARTS.

MORE ABOUT LIFE-SAVING GARMENTS.

MENTION was made last month of the utilisation of Java kapok for life-saving garments. We have pleasure in giving some further information. Java kapok, a downy substance made from vegetable fibre which hitherto has been almost exclusively used in the soft-goods trade, owing to the combination of warmth and lightness, is the most suitable material for charging life-saving appliances, being five times more buoyant than cork. Some time ago an ingenious inventor, cognisant of the various properties of kapok, devoted his attention to the utilisation of the material on new lines. The objection to the ordinary life-belt is that it has to be donned hurriedly in an emergency, and in the rush and confusion of panic it is apt to be wrongly adjusted, when it is sure to prove a failure. The inventor conceived the ingenious idea of combining the kapok appliance with garments which could be worn continuously, and could therefore be relied on without the slightest apprehension in time of sudden danger. This new application of kapok has been very successful, and various life-saving garments can now be worn at any time and under any circumstances without the slightest inconvenience. For instance, there is the form of appliance which recalls the familiar chest-protector, and which weighs only thirty ounces and is held in position by means of strings tied round the waist. It is very warm, and, unlike other life-saving jackets which have been devised from time to time, is perfectly safe, as even the non-swimmer is not in the slightest danger, and whether injured or insensible there is no risk of sinking. Belief in the efficiency of this appliance has received ample testimony, one of our largest transatlantic liners having been equipped with more than three thousand two hundred jackets. In the recent naval disasters hundreds of valuable lives have been lost owing to the lack of life-saving appliances. This want can be met by the aid of the kapok waistcoat made in a form suitable for everyday wear, the style being capable of variation to meet individual requirements. It can be worn either under or over a jersey, and there is not the slightest interference with the free movement of the limbs. Two pockets are provided for flasks if desired. Although the waistcoat is apparently insignificant, sufficient kapok is carried to support a heavy man in the water for at least thirty-six hours. The new life-

preserver can also be utilised for teaching swimming, or it may even be used by swimmers. At the same time, should the expert swimmer be seized with cramp or suffer an injury, there is no danger of drowning. The outstanding feature of the system is that the position into which one is thrown when immersed is precisely that which would be assumed naturally if the person were unconscious—that is, upon one's back, with the head well out of the water as if resting upon a floating pillow.

CHALK AS FUEL.

In Canada and the United States a coal-peat fuel has been utilised somewhat extensively, the peat being mixed with coal-breeze and then pressed into briquettes. Such fuel has been found efficient and economical. In Germany the most common practice is to use the peat for the bulk production of electricity. The electric generating station is set up in close proximity to the peat-bog, and the peat is used for the production of producer-gas which drives huge generators. One of these stations, which has not been long in operation, had an output, prior to the outbreak of the war, of ten thousand horse-power-hours for lighting and power. But it is not generally known that chalk can be converted into a profitable fuel. If the chalk is pulverised and then combined with 30 per cent. of breeze and 10 per cent. of solidified tar, the mixture being compressed into small briquettes or pebbles about the size of a chicken's egg, the chalk briquettes will burn with perfect satisfaction either in an open grate or under a boiler. This fuel has the advantage of being smokeless, has a high calorific value, and burns freely. The cost of producing such fuel may be decreased by utilising the refuse and garbage collected from the household dust-bin as one of the constituents of the briquette. The residue of such fuel possesses an economic value, inasmuch as lime forms the larger portion of the ash.

SAFE AND AUTOMATIC ELECTRICITY-CHARGING APPARATUS.

A very simple, safe, and automatic charging apparatus for recharging the accumulators of pocket and cycle lamps, &c., has been placed on the market. It consists of a porcelain holder and automatic switch combined; and by merely slipping the cell into the holder the switch is operated and the terminals of the cell are cor-

rectly connected ready for charging. This device enables householders who have direct-current electricity in their homes to make use of the accumulator type of pocket-lamp, which, of course, can be recharged time and again at the cost of only a very small fraction of a penny. The apparatus can be fixed in any incandescent lamp circuit, and whether or not a cell is being recharged the incandescent lamp may or may not be used, just as desired.

THE 'MINENWERFER.'

Attention has been drawn in official despatches to the mine-thrower which is used by the German forces for the bombardment of our trenches, and emphasis has been laid on the destructiveness of this weapon. This is referred to at page 317, in 'Notes on the War.' It has been described as a new arm, but as a matter of fact it is a revival of an ancient missile in which the Germans have displayed much enterprise. The *Minenwerfer* comprises a small mortar which can be used in a trench. But it differs from the conventional mortar in that the projectile is placed outside instead of within the gun. The barrel is somewhat small in calibre, being, in fact, only of sufficient diameter to receive a long rod, the free end of which projects beyond the barrel. The bomb, of spherical shape, is provided with a hole large enough to receive the rod. When the gun is loaded the mine rests upon the barrel of the weapon. According to report, this *Minenwerfer* is said to be worked with compressed gas, inasmuch as there is an absence of sound, while the missile has a low velocity. But the weapon is actually fired by a small charge of low explosive such as gunpowder. A high charge is not necessary, for the simple reason that the missile is used over very short ranges. When the arm is fired the rod and bomb are ejected into the air. As the mine travels the rod becomes loosened, and finally drops clear of the bomb. The bomb has been said to be charged with carboic acid; but when one reflects upon the extensive damage which is said to be wrought by the explosion of the missile, it is evident that it must be charged with a high explosive. It is said to dig a hole from thirty to fifty feet in diameter and ranging from thirty to forty feet in depth. The only explosive capable of making such an excavation is trinitrotoluene, which is probably the most powerful explosive known. As this explosive is made from picric acid, which is a carboic acid derivative—produced from the destructive distillation of coal—the 'strong carboic acid smell' which is said to be noticeable after explosion points to the use of T.N.T., as it is called. While the *Minenwerfer* is destructive, it has also the disadvantage of being quite as deadly to the men using it as to those against whom it is thrown. In fact, the rod or tail of the bomb is often hurled back like a boomerang

into the trenches from which it has been fired. It was this risk of rebounding with force and killing and maiming the users which brought the weapon into disrepute, so probably it has been requisitioned more as a message of 'frightfulness' than one of death and destruction.

INFLUENCE OF RADIO-ACTIVE ORES ON PLANT LIFE.

A series of interesting experiments have been carried out by Mr Martin H. F. Sutton, F.L.S., of Sutton & Sons, Reading, with a view to determining the effects of radio-active ores and residues upon plant life. The investigations had a threefold object. In the first place, it was desired to ascertain whether radio-activity exercises a beneficial effect or otherwise upon plant life; secondly, whether the benefits accruing therefrom demanded strong or weak dressings; and, thirdly, whether radio-activity can be used with advantage to accelerate germination. The experiments, the results of which have now been announced, were conducted for more than a year, and were made in connection with some six hundred pots and boxes of various vegetable and flowering plants. The materials employed comprised respectively radio-active ore certified to contain approximately eight milligrammes of radium bromide per ton of ore; radio-active ore obtained from a source different from the foregoing, and containing approximately nine milligrammes of radium bromide per ton of ore; mine residue after radium had been extracted, but certified to contain 1·8 milligrammes of radium bromide per ton of ore; and black oxide of uranium. So as to obtain incontestable comparative data a complete control system was adopted. The sum of the experiments, which have been related in detail in an interesting brochure embellished with photographs, is interesting. This phase of the science of agricultural stimulation, as it might be termed, is in its infancy; but nevertheless Mr Sutton's contribution on the subject is of inestimable value, inasmuch as it represents one of the few such researches in plant life that have been carried out in these islands on scientific lines. The operation is necessarily protracted, but it is one of extreme fascination. Exigencies of space will not permit of dealing with the experiments in detail; but it may be mentioned that, so far as germination being stimulated by radio-activity is concerned, the results are rather negative than positive. Yet the investigator rightly emphasises the fact that further experiment is necessary before advancing any conclusive decision on this subject. In so far as the plant-growth experiments are concerned, it seems to be apparent that radium emanations possess the property of developing and increasing growth.

A WEATHER-PROOF TOBACCO-POUCH.

Thoughtful inventors have devised ways and means of ensuring the dry condition of matches and cigarettes in the trenches, but hitherto the

manufacture of appliances for the preservation of tobacco in a dry and full-flavoured condition has escaped attention. This deficiency has now been met by the recent introduction of an ingenious tobacco-pouch. This receptacle is made from a new material, the fabric being of a rubbered nature. The waterproofing is so secured that there is no danger of the tobacco—which, as is well known, readily absorbs the flavour of the materials in which it is packed if they are at all aromatic—being affected. Thus the tobacco may be kept indefinitely in a full-flavoured, pure, and serviceable condition. The pouch is fitted with two flaps. The inner protective flap is buttoned over, and then the outer flap is folded over and buttoned not only to the inner protective flap but also to the body of the pouch, so that it is difficult for wet to penetrate. The pouch is frost-proof; it is very light and of great strength, which renders it immune from the rigours of warfare; and it has the additional advantage of being inexpensive. It should be very suitable in climates where the preservation of tobacco is sometimes difficult.

MACHINE FOR CLEARING, CLEANSING, AND REPAIRING DRAINS.

This is an invention which should appeal to architects, property-owners, builders, and others, as the work is done at a nominal cost and without necessitating trench excavations. The system can be used in all drains irrespective of depth beneath the surface, all defects in the drains being repaired with equal facility. If a repair is required the drain is first cleared of all obstructions. This is effected by means of revolving iron wheels fitted with iron spikes, which are passed through the drain, and the rapid rotation of the wheels serves to loosen all obstructions which may be lying in the conduit, or which may have become attached to the inner wall of the drain. Then revolving brushes are introduced, which ensures the thorough scrubbing of the surface, and the loosened matter is flushed away with water. The repairing-machine is now inserted, and as this passes through the drain, cement, under heavy pressure, is forced into any cracks, holes, or fissures that may have developed, the process being repeated until it is impossible to force any more cement into the defective places. Although cement is applied in this manner, it should be remarked that no cement is deposited on the interior of the pipes, as the dressing is confined to defects. Thus the original surface of the pipe is preserved. Drains repaired in this way have been tested searchingly, and have been proved to preserve absolute watertightness for five years after being so treated. The cost of repairing underground conduits in this manner is trifling compared with the methods generally adopted, while the method is in every way as effective as opening up and repairing or replacing defective pipes.

PAPER PULP FROM UGANDA.

The demand for paper pulp is increasing rapidly, and the denudation of the vast forests of the soft woods adapted to this branch of industry renders it necessary to discover alternative sources of supply. In this respect some interesting experiments have been made with the stems of the elephant grass—*Dennisleum purpureum*—which flourishes so luxuriantly in Uganda. The pulp produced from this raw material is found to be of good quality. Doubtless the prosecution of this industry would be of far-reaching economic importance to our East African colony, but unfortunately the nearest available markets are at a considerable distance. The commercial prospects of the development are, therefore, affected by the transport charges of the pulp, and also by the supply of limestone suitable for causticating soda-ash, which at present has to be imported. If these two problems can be solved satisfactorily a promising future is assured, inasmuch as the raw material is extremely abundant, tracts of country extending over many hundreds of square miles, which are generically described as 'bush,' being densely clothed with this grass. The experiment is being conducted upon sound scientific and commercial lines, a British firm of paper manufacturers being interested in the scheme and co-operating with the Imperial authorities. At the present moment the bulk of wood pulp used in the manufacture of cheap papers, such as those required for the daily press, is imported from Scandinavia and Newfoundland.

To Correspondents who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

THE OVERTAKING OF SPRING.

SPRING has departed! Oh, let us follow,
Follow north with the homing swallow!
Is she now hid in primrose cover
Only known to the happy lover,
Lies she in dell
Strewn with bluebell
And frail anemone down in the hollow?

Lilac scent her secret is telling,
Song of the nest from the thrush is up-welling;
We thought her lost and ourselves forsaken,
But her fairy feet we have overtaken;
Kingscups of gold,
Fern fronds unrolled,
Under the hawthorn here is her dwelling!

Love has departed, vain now to follow,
Follow after with autumn swallow;
Fugitive love than bird is fleetier,
Never again can we hope to meet her.
Far has she fled
To the realms of the dead,
No more to be found on height or in hollow!
J. M. KRAUSE.

Chambers's Journal

SEVENTH SERIES

THE HEIR TO SUNNINGHALL.

By Mrs HERBERT MARTIN, Author of *A Labour Member*, &c.

CHAPTER I.

'MY DEAR GREGORY,—You must, after all these years, have pretty well forgotten your old aunt Lydia, with whom you spent some holidays before your father left England, twenty years ago, when you were a curly-headed schoolboy; and I know I have been very lazy and unkind in never recalling myself to your memory. Indeed, I have grown so elderly and lazy that I am afraid auntly affection alone would hardly have roused me to write to you had I not had sad news to communicate—sad, I should say, for *me*; for you not altogether so. My poor old brother Anthony, the "Squire," as every one called him, the only survivor of the family except me, and the eldest, your great-uncle, has passed away, and it is my duty to write to you, as well as the lawyer, who will announce it formally, to tell you that he has left you sole heir to Sunninghall. You will understand that my affectionate congratulations to you are mixed with sadness. For the last ten years, by my brother Anthony's wish, my husband and I have lived with him, and I have kept the house. He was partially incapacitated from active life all that time by a stroke; and though he recovered mental vigour, he had never again the full use of his powers. Sunninghall was the home of my infancy and girlhood till I married Mr Guthrie and settled near Leamington; it is a spot very dear to me, so you may suppose I was rejoiced when Anthony made me a home there again. I think you may have visited the place in your childhood, as my dear brother retained a kindly remembrance of you; but you were, of course, very young when your father, our poor nephew Reginald, took your mother and you to South America. I regret that our intercourse has not been carried on since. My brother, I know, was vexed at your leaving England, as your father was his only surviving nephew. The lawyer will give you all business particulars. I have now only to add my hopes that you will come to England as soon as possible, and let me have the pleasure of welcoming you to your new home. I have kept it—I think you will say—in perfect order, and you may rely on my doing so. We are not a large family to welcome you—only my husband

and myself, and a young companion named Margaret Emerson, a distant connection who was left destitute some few years ago. With kindest messages from my husband, believe me, dear Gregory, your loving aunt, LYDIA GUTHRIE.'

Gregory Le Fevre—a bronzed, open-faced man of a little over thirty—read the foregoing letter with frowning attention as he sat in the veranda of his house one warm evening. He was alone, but for servants and working-people of the ranch, as his partner had gone on a visit to Rio, and he had no one with whom to discuss the rather startling news just received from England. Le Fevre was a bachelor, a man used to a rough life, plenty of work, little luxury, and no society since the death of his father and mother, who had come out from England to take over a ranch which a relation had left them. His was a blunt, frank, rather fiery and passionate, but kindly nature; he made some enemies, but staunch friends; and even the shifty South Americans who worked for him had both liking and respect for the man who was ready to help as well as to storm when occasion offered. As his partner said, he was straight as a line, and soft-hearted to folly when his heart was appealed to. He read his aunt's letter twice, muttering to himself, as men will who are used to solitude, 'Old Aunt Lyddy! Of course I remember her. A soft, mousy sort of woman, very kind. I have a warm remembrance of those holidays: her treats and her cakes and sweeties. I don't think I cared much for her old man; but I don't seem to have any clear recollection of him, except that he was fussy about carpets and my boots—connection obvious. And so Uncle Anthony has left me Sunninghall! Well, that's surprising. My father always said he had quarrelled with him for leaving England, and the place was to go to Aunt Lyddy. Of course she must stay on if she wants to. Hard luck for her to be turned out where she's been mistress. What's it worth? Let's see the lawyer's letter.'

He opened this, and, still frowning, read the business-like and rather abstruse statement with the copy of the will: 'My house and estate

called Sunninghall, in the county of Surrey, absolutely to my nephew Gregory Le Fevre of —, South America; shares in so and so and one thousand pounds down to my sister Lydia Janet Guthrie; legacies to gardener, housekeeper, nurse, to the County Hospital, and so on. These details did not interest Gregory. He read on. Mr Barnes explained at length the acreage, value, &c. of the estate—it was not large—and the house, an old-fashioned, pleasant Jacobean mansion, which Gregory faintly remembered; the whole bringing in an income of about two thousand pounds—not a magnificent heritage, but a pleasant and interesting one in the loveliest part of the lovely Surrey country. The very name seemed to bring to the reader's nostrils the smell of warm gorsy commons and the thyme underfoot; while memory painted a picture, vague but alluring, of gently folded hills, beech and fir woods, cowslip fields, and blue misted glades filled with hyacinths. His eyes scanned the bare prairie round his bungalow, and he drew a long breath. 'Home! England! Surrey! How dear it sounds!' He wished there was a friend at hand to sympathise. As there was none, he sat down and dashed off a friendly, grateful letter to his old aunt, which ended thus:

'Of course you'll go on thinking Sunninghall your home, as I always supposed it would be during your lifetime. I will start for England as soon as I can dispose of my ranch here, and am looking forward to being welcomed by my only near relation.'

It did not take long to sell his belongings before he made tracks for the Old Country. Being the most easily gulled and careless of mortals, with a faith in his fellows that not even continual disillusion could diminish, he was naturally 'had' over the transaction. What did it matter? He had already accumulated a modest fortune, and his new property awaited him. He sold all he could not pack; bade farewell to his few friends, his numerous employés, his bungalow, his horses, and his ranch; and sailed for England on prosperous seas, arriving in late spring, when the little green garden-land looks its most lovable. Le Fevre took a light heart with him through the blossoming country, with its endless promise of things too fair for fruition, too lovely to last.

'Dear little hedged-in orchard!' he said, as green field and smiling hillside flashed by him; 'how strange and pleasant it is to breathe your friendly air again after those great bare spaces and sun-dried plains! I wonder if I'm going to be "happy ever after," as the old Grimm stories have it.'

Sunninghall village and manor house were four miles from the nearest station, and that a very quiet one, at which few trains troubled to stop; so his was a lengthy journey from junction to junction, and it was towards evening when

at last the little, fussy, slow train puffed elaborately into the station of Combley.

There was only one vehicle outside the little building, an old-fashioned victoria, in which sat two ladies. He did not exactly recognise the elder, yet the something familiar in her look and her welcoming smile made him sure of her identity; and if he had not recognised her, her outstretched hand and greeting would have told him that this was his great-aunt Lydia. She looked a little young to be in this relation to the man of thirty, and indeed was only sixty-seven, being the youngest of a family which had been headed by the late squire, who was over eighty when he died. Yes, he saw, as he had expected, a rather 'mousy-looking' little lady, small, neat, dainty. Her pale, smooth skin was hardly wrinkled, her eyes still bright; her pretty silvery hair was an adornment rather than a blemish. Her voice was peculiarly soft, rather low-pitched—*trainante*, as our neighbours call it.

While he took the small outstretched hand and eagerly responded to the affectionate greeting she gave him, he had hardly time to notice her companion, who sat quiet, grave, and erect by her side, and to whom she introduced him: 'My nephew—Margaret Emerson.' When his aunt gave him time and he was seated opposite the ladies, however, he scanned the companion's face in his quick glancing way. He saw a large-made and handsome woman, apparently nearly his own age, for she had no air of girlishness. Large, heavy lids often veiled her eyes; but when lifted those eyes were peculiarly sad, he thought of a deep-chestnut brown, the same colour as her abundant hair, rather thick eyebrows, and deep lashes. Gregory had been wont to say that eyes were not really the expressive feature, that it was rather conventional to speak of 'sad' eyes; but now he was curiously impressed by the melancholy which seemed to lurk as a shadow in their brown depths. Her complexion was of a creamy but healthy pallor, the well-shaped lips closely folded. He thought her expression almost forbidding till these lips opened to speak and smile, and then a certain softening made the handsome face attractive. She spoke, however, hardly at all; nor was there need she should, for his aunt prattled on in a genial, lively flow, asking innumerable questions. This was Mrs Guthrie's way; her talk seemed all interrogatory, interested, appealing. When she came to answer she had little to say. They lived so quietly that it seemed as if all the while he was leading his hard, adventurous life out there they were vegetating in their still, peaceful, country way. 'Only death finds us out,' she said suddenly, sighing in the midst of her lively flow of talk. 'Your poor uncle! You don't remember him, Greg?'

'Hardly—very dimly. Wasn't he very silent, a little gruff?'

She sighed again. 'Yes, poor dear! He

never could do himself justice, he was really so good. It was so sad to have him lying unconscious in his own dear home—a living death. There!’ she cried suddenly, breaking again into vivacity; and, leaning forward, gripping her nephew’s arm, she directed his attention to a gap in the woodland through which their road took them. ‘Look, Greg dear, through the trees. Those red twisted chimneys and that bit of roof—there is Sunninghall!’

He looked, and then at her again. Her face was aglow with, for the first time, unmistakably vivid feeling. ‘You love the place, Aunt Lyddy?’ he said involuntarily.

‘Love it!’ she repeated, her small, fine features quivering with emotion—‘every stone, every twig, every flower!’ There were tears in her eyes, and she looked appealingly at him. ‘And now, Greg, it’s all yours. You must love it too.’

There seemed to him a touch of reproach somewhere. He took her small hand. ‘It’ll always be yours too, Aunt Lyddy!’

She slowly shook her head, but did not speak; her eyes were still turned to the spot to which she had drawn his attention. He found that the heavy lids of Margaret Emerson were lifted, and she was looking earnestly and curiously at him. He felt puzzled somehow, as if he could not understand the silent, handsome woman who thus looked him through and through.

Presently they turned out from between the woods on each side of the road to an open, park-like space, studded with fine old oaks and beeches and groups of Scotch firs, and were at the lodge-gates. The old, mellow, red Jacobean house, with its high-pitched gabled roof, quaint chimneys, and white eyebrowed windows set in deep mullions, stood before them, richly coloured in the evening sunlight. Gay beds of old-fashioned flowers decorated the front; and a terrace walk, with moss-grown stone vases and a sundial,

stretched along one side. At the door stood a bent elderly figure, not silver-haired like Mrs Guthrie, but with a thick crop of rather harsh, dry, dark hair, eyebrows like quill pens over small eyes, and a long, smiling mouth.

‘My husband, dear Greg,’ Mrs Guthrie said, leading her nephew up the old stone steps. ‘He’s so gouty, forgive his not coming down to meet you; but he is very pleased to welcome you home.—Aren’t you, Daniel?’

‘How are you, my boy—how are you? Glad to see you—glad to see you.’

The old gentleman shook him almost violently by the hand. Gregory recalled his early prejudice. He had once thought he did not much like his uncle Guthrie, but this was a kind, genial old man, though perhaps not so prepossessing, not so sweet, as his dear little aunt, who reminded him, as she twittered away, of some small gray bird.

‘Come in! Come in! Welcome to Sunninghall!—welcome to Sunninghall!’

Gregory soon found that it was his uncle’s peculiarity to repeat every phrase, however meaningless, two or three times, always with exactly the same intonation.

‘Dinner’s almost ready—almost ready. Perks will show you your room, and help you to unpack a little; but don’t be long—don’t be long. After dinner we’ll show you round—show you round—your domain.’

‘I will!’ his aunt cried gaily. ‘No one but me shall do the honours of the dear old home. But, as Daniel says, dinner first; dinner’s all-important. We’ll all get ready. *Au revoir* till then, dear Greg!’

They all moved in different directions, Mr Guthrie following his wife, Gregory the old, dull-looking servant-man, and Margaret Emerson going to her room, far away.

(Continued on page 362.)

THE OUTER PATROL.

PITCH-DARKNESS. The south-easterly breeze chips the tops off the short, crisp little seas, and flings them to leeward across the low decks in sheets of icy spray. It is not rough; there is merely a short, steep lop, in which the waves rise and fall with hardly any forward movement; so the ship, in spite of her wetness, is not pitching or rolling. It is regular North Sea weather, what we have come to look upon as ‘destroyer weather;’ and the little vessel is well out from her own coast patrolling to and fro to intercept any hostile craft that may attempt to cross her line.

But on such a night as this it is impossible to see more than a hundred yards; and, as no lights of any kind are being shown, the first warning we may get of the approach of another

ship will be an intense black blur against the lighter darkness of the sky and sea. If she is sighted on a bearing sufficiently clear of us, well and good; if she is not, nothing that we can do will avert a collision, and a collision on such a night as this is unthinkable, so we do not consider it.

We may come across any type of hostile vessel. It may be a battle-cruiser or cruiser coming from Heligoland or Wilhelmshaven under cover of darkness, so as to reach the British coast at dawn. If we sight her first we may be able to put a lucky torpedo into her before we are discovered; and this, if we hit, may either sink her outright or send her limping home again with her tail between her legs. If she sights us first there will come the sudden

blue-white glare of searchlights and a terrific outburst of orange gun-flashes against the inky blackness of the night; next the spouting spray fountains, and the crash and the explosion of the bursting shell; and we, if the shooting is good, as it probably will be, shall feel the little ship quivering as the projectiles drive home. We may be sunk outright; may return scot-free to tell the tale, or with our hull, bridge, and funnels riddled with high-explosive shell splinters, and a heavy casualty list; but, whatever happens, we hope to get in our torpedo.

It may be that we shall come across a submarine, though it is hardly likely that we shall see one on a night like this. If we do, however, there is only one thing for it, and that is to drive straight at her at full speed on the chance of ramming her before she can dive. We may sink her, or we may not; but it is the only thing to do.

A hostile mine-layer, if we saw one, would come as rather a relaxation, for we could either torpedo her outright or sink her with our guns; but the mines themselves are the very devil, for dozens have been sighted in the locality where we are patrolling. They may be 'floaters,' dropped by the enemy during one of his sallies from Heligoland or Wilhelmshaven, or others which have broken adrift from our own or the enemy's mine-fields. Whichever they are does not matter to us, for in this pitch-darkness we cannot possibly see them to avoid them. If we bump one it may not explode; but the chances are it will. If that happens our goose is properly cooked, as no destroyer on earth can stand the detonation of several hundred pounds of T.N.T. without sinking.

The men round the guns and torpedo-tubes are well swathed in oilskins, thick woollen stockings, sea-boots, a series of blue woollen mufflers, gloves, and Balaklava helmets, the last three items having been provided by sympathetic lady-friends of the officers. But the piercing wind and the driving spray have the unhappy knack of finding their way through the stoutest garments, and there is not a soul on deck who does not feel the icy water slowly finding its way down the small of his back.

On the bridge, with the officer on watch, the quartermaster at the wheel, a signalman, and the man on the lookout, is the lieutenant-commander in command. In the ordinary light of day he looks absurdly young to be in charge of a vessel which can career about the ocean at a full thirty knots. A closer inspection of his face will reveal a network of tiny wrinkles round the corners of his eyes. They come from peering ahead in all weathers—sun, hail, rain, sleet, or snow, with as often as not the stinging, driving spray coming over the bows like volley after volley of small shot. Six months of war have left their mark; but the responsibility of his job seems to sit very lightly upon his shoulders.

By this time he, and all his officers and men for that matter, have become fatalists. If they are to be blown up, drowned, or to suffer some other equally violent death, it has been preordained, and nothing they can do will save them from their fate. If, on the other hand, it has been decreed that they shall come through the war without a scratch, so much the better.

The lieutenant-commander stumps up and down the bridge, stamping his sea-booted feet to keep them warm. If it were daylight we should notice that he looks more like an Antarctic explorer than the captain of one of His Majesty's ships, for he wears a hooded drab-coloured duffle coat reaching down to his knees, made of material fully a quarter of an inch thick, sea-boots, with thick white stockings, the inevitable blue muffler round his neck, and a very un-uniform-looking fur cap. He also seems rather stout round the body; but this is accounted for by the life-saving waistcoat presented by his wife, which he wears whenever he goes to sea. Round his neck are the binoculars through which he is constantly peering; while he is calmly sucking at a very foul, evil-smelling pipe, with the bowl inverted to keep the spray out.

Since hostilities began he has spent day after day, night after night, on the bridge of his little craft. He has had to stick it in all weathers, and at first he felt rather nervous, for war was quite a new sensation. But that feeling—after one or two episodes in the Heligoland Bight—has vanished, and he has come to the conclusion that he has been on active service ever since he came to sea, for he has always had the vagaries of the sea itself to contend against, and that is more than half the battle. An occasional 'scrap' comes as an exciting interlude, and now all he hopes for is the chance of 'doing something.' Perhaps he will get his opportunity, and may find himself a D.S.O. Perhaps—But he does not think of that. A V.C. takes a lot of earning.

At last the first signs of dawn appear in the eastern horizon, and as the broad band of pale orange and scarlet gradually gathers colour and increases in size the indigo-blue sky lightens to pale azure. Five minutes later the stars overhead have vanished, and the lower edge of a low-lying purple cloud-mass to the eastward blazes with crimson and gold. Then the glowing edge of the red-hot sun appears above the clear outline of the horizon. Gradually the great orb rises until the whole of its crimson mass is suspended in space above the horizon. The rosy glory of the dawn suffuses the whole scene, until the breaking tops of the short, steep little seas are tinged a livid pink. The day has come!

'Heigho!' mutters the lieutenant-commander, yawning luxuriously and stretching his arms above his head. 'Thank the Lord for the day—'

light!' He is thinking that in about another five hours his weary vigil will be over, and he will be steaming back to his base at twenty knots. He has been out on the patrol line for over two days and nights, and the prospect is rather pleasant, for on arrival in harbour he will be able to get a little sleep; while the

mail will arrive, and he may get a letter from his wife.

'Heigho!' he remarks again. 'Messenger!'

'Sir?'

'Nip down to the galley and see if you can steal me a cup of ship's cocoa. Let it be hot!'

Life has its compensations, after all.

THE BRIGHT EYES OF DANGER.

By JOHN FOSTER, Author of *On Old Speyside*, *The Bernardine*, *The Ship of Shadows*, &c.

CHAPTER XXIII.—IN WHICH I GET A GLIMPSE OF SUN.

HE led the way to a chamber, where clean water wrought a great improvement in our looks, for our wounds, although not serious, had bled freely enough and to spare.

'That is better,' said he, after surveying himself. 'Even now we are scarcely presentable; but my poor Charlotte will be in a fever until we hear your story. Come, and I shall present you.'

'I have met Mistress Charlotte Macdonell before; and, to be plain with you, monsieur, I have doubts regarding my reception.'

'Met her before! *Ce n'est pas possible!* In the North?'

'No; it was here.' And then and there I told him of my first accidental meeting, the letter found in my holster, my confinement and escape by the tidal cave. I said nothing about my seeing the blind man, nor the hidden paper. 'Perhaps,' I wound up, 'it was *your* bullet that hit my horse's ear and sped me onward. If so, I owe you my grateful thanks.'

His eyes were round with amazement.

'And after all this—you came back—alone!' he said slowly.

'Yes. I had reason to think that there was a lady in some stress of mind; perhaps in danger.'

'You have done us a great service—oh! but of the most gallant! Monsieur, you have saved our lives; and there is more, so much more, behind all this! And your coming here again in the very moment of our extremity, was it by chance?'

I took from my pocket the billet the dead rascal had given me, and handed it to him.

He read it, a dark flush of anger rising on his face. 'This is a black business! I cannot see the end of it. You say that you never saw Philip Macdonell, whom I blush to call cousin?'

'Never to my knowledge.'

'He was here last night, as my broken head reminds me. Whom did you see?'

'I saw only two out of the three. The one posted to watch the door is, I fancy, lying where I left him. The other was a swarthy little mean-looking man.'

'With a face like a—a toad's?'

'The very man!'

'Ah! Roderick Innes! I thought as much! The other—my sweet cousin—is as unlike his tool Innes outwardly as Lucifer is unlike Caliban. Seldom have good looks and bearing gone to hide so deep and treacherous a heart!'

'I never saw him. He moved in the dark.'

'It was ever his habit. He is so used now to the shadows that an honest sun would make him blink. A straight path would bewilder him. The man is a mask,' he said, a world of contempt and bitterness in his voice. 'It behoves us, Monsieur Layton, to be frank with each other. You have no other desire?'

'None. Let me begin at what I take to be the very heart of the matter. Why is Glenira in hiding here?'

He was plainly taken aback at the sudden question, but his eye did not flinch from mine.

'*Dieu!* How come you, a stranger, to be aware of this?' he asked.

'As I told Mistress Charlotte, I was in Edinburgh on my own business, having no concern with Charles Edward's Rising, nor art nor part in it. From the letter found in my holster she did not credit this, and I cannot blame her. But events have swung in my favour. I must tell you that when I escaped by the tidal cave I saw the one you speak of as Glenira—a tall, strong man, but blind and helpless, and my heart went out to him. I believe that I have information that would be of value regarding Glenira. In any event, it shall clear me of any suspicion of collusion with cowards.'

'I require no proof, monsieur! Your conduct disarms unworthy thoughts.'

I thanked him, but said that it was on my mind to put the cause of my intervention in the affair beyond doubt. 'I suggest that you present me to the châtelaine when she has sufficiently recovered to see us. We can then try to unravel the skein of this affair. I shall tell what I know.'

'And I, Monsieur Layton, promise you an equal measure of confidence.'

We went out. Half-way across the head of the staircase the door opposite us opened, and Mistress Charlotte appeared.

'Bertrand!' she called, running towards him, and again there was never a glance for me. 'Is it a nightmare? You are safe?'

'Thanks to this gentleman. I present to you Mr Edmund Layton. You have met before.'

She wheeled round and faced me, a high colour in her face. I bowed, but for the life of me could say nothing but mumble a conventional, 'I am honoured;' and a complete silence fell on us.

At last she said, in a voice little above a whisper, 'It is—it is'—

I found my voice. 'Madam, I am "the clumsy falconer," as you designated me at our last meeting. If I left The Garth without ceremony, a few bullets that sped me on my way must be my apology. I have returned of my own free-will, because I had good ground for suspecting some danger to be afoot. Your own knowledge, and what this gentleman can add to it, spares me, I hope, from hearing my name coupled with the cowards who were here to-night. I have done my poor best to earn this.'

I said more to the same purpose. It all sounded stilted and self-sufficient; but I had to choose between this and circumlocution, in which I was never an adept. I delivered my speech, too, like a schoolboy, with my eyes on my toes, wishing that some one might appear who could sing my praises better than myself. (I have since found this to be by no means an uncommon human weakness.) When I looked up she was looking at me, a mist in her eyes, her bosom heaving.

'I did you a great wrong. I—I said hard things;' and her voice was low and sweet.

'It was but natural. My case looked black enough, I own.'

'I ask your pardon. You are a brave man. My brother Bertrand and I can never repay you.' She held out her white hand.

Her brother! The words came to me like a burst of music. Fortunately I contrived to stifle a wild desire to say something, for I make no doubt it would have been something incredibly foolish. As it was, I stared from one to the other, until it suddenly dawned on me that she was still holding out her hand, and that I was behaving like an oaf, while Bertrand was regarding me with mild astonishment. I think at last I came out with 'Quite so,' or 'Of—of course,'

or something equally illuminating, and bent over her little hand.

Bertrand went to the casement and flung it open. 'It is the morning!' he cried. 'See!'

The rain had ceased. Through the open casement came the scent of the dawn after rain, fresh and incomparable—there is no scent like it!—and the sound of bird-voices. A penitent sun was climbing a serene sky, and out on the Firth long rollers, the aftermath of the gale, gleamed white against the sea's blue.

'What say you, Monsieur Layton, to a patrol of the house?' He gave me a meaning look.—'Charlotte, *ma mie*, do you remain here. There is nothing to fear. We have a little matter to talk over.'

We went down to the hall door. Outside, the dog lay stretched on the wet, shining grass, and huddled up close to the wall, where I had put him, was the man. He was a gruesome thing in the sun's eye; and the sight of his red hair weighed on me.

'Have no regrets, *mon ami*,' quoth Bertrand. 'I am more concerned about the dog's death than the man's. Poor Col! Poisoned, I suspect. They laid their plans well. As for that thing, I repeat, have no regrets. It was your death or his.'

'True! But up till now all the blood on my hands has been an otter's or a badger's.'

'Brute beasts, but with more mercy in them than this wolf.' He bent over the body. 'It is neither Innes nor Philip Macdonell—a thousand pities! *Parbleu*! You do not know your own strength. You must have muscles like oak-roots. Look at his throat! Help me to search him.'

I could not. The thing repelled me. No doubt I had throttled him, for it was, as De Boux said, his life or mine in the dark night. But in the clean, wholesome morning I would not set eyes on him, and turned away into the garden.

Bertrand soon joined me. 'Nothing in his pockets but a sixpence,' he announced.

'Once mine. I gave it to him. He was the messenger with the forged letter.'

'Twill pay for his burial! One thing I shall make it my duty to ensure. The good dog shall not be buried in the same grave with this carrion!'

(Continued on page 355).

VALPARAISO IN WAR-TIME.

By OSWALD H. EVANS, F.G.S.

MEASURED in a straight line from any country in which armies are actually engaged in the field, it is difficult to find on the map of the world a spot more remote from war's alarms than Valparaiso, the leading seaport of

Chile. The geographical position of the country—with the wide Pacific in front and the snow-bound Cordillera behind, to the north a well-nigh impassable desert, and a trackless desolation of forest and mountain for a southern boundary—

would appear to afford its people in these times of trouble an enviable isolation. Chile, moreover, has a glorious climate; in the centre and south its soil is capable of producing a quantity of food-stuffs far in excess of the needs of its five million inhabitants, its long coastline is washed by a sea abounding in excellent fish, and the hills of its most barren provinces are rich in a great variety of minerals. This land, so favoured, should surely be self-supporting and pre-eminently capable of withstanding the shock of a temporary cessation of commercial intercourse with Europe.

Yet, while such statements are admitted to be true by eminent Chileans, and frequently form the subject of comment in the Press, it is a commonplace of conversation that, outside of countries actually involved in the conflict, Chile has been harder hit than anywhere else in the world; and facts can be brought forward to prove that the remark is no mere local prejudice.

The reason of this unfortunate state of affairs is not far to seek, since it has supplied a theme for pessimistic patriots for many a year. Chile has been allowed to become the country of one commodity—nitrate of soda. In the sun-scorched deserts which cover the northern provinces of Tarapaca and Antofagasta, and nowhere else in the world, this remarkable salt—valuable not only as being the most potent of fertilisers, but as the basis of all industries using nitric acid—is found in enormous quantities, and the deposits are exploited by companies of all nationalities, who pay a heavy tax to the Government for the privilege. Its extraction and purification, in the course of which iodine is obtained as a valuable by-product, is a comparatively simple matter; whilst the almost incredible quantity exported in normal years brings in a considerable income to the Government. None the less it is a question whether nitrate has proved a blessing or a curse to Chile. The republic took the regions in which the richest deposits exist from her northern neighbours by the strong hand, and the justification of the act must be left to students of international morals, who at present have other matters in hand. There are not lacking those who see in the present misfortunes of the country an instance of 'sowing the wind and reaping the whirlwind.' On the other hand, it may be urged that under Chilean rule the north has been developed to a degree far beyond any progress likely to have been attained under the flag of indolent Peru. The fact seems to be that the nitrate, by affording a fatally easy source of revenue, has hindered the due development of the other resources of Chile as a whole. The mineral and agricultural interests have had to take a position of secondary importance, lacking railway facilities, and deprived by their powerful rival of reasonably cheap labour. When the fact is mentioned that some 70 per cent. of the nitrate exported passed

through the commercial circles of Hamburg, the effect of the war upon the leading industry of Chile may be imagined.

The paralysis of all labour connected with nitrate has given a severe blow to commerce in all its branches. Cessation of employment in the north, where thousands of labourers lived and worked in *oficinas* as completely isolated from the means of life as they would have been in ships at sea, necessarily implies the stopping of the big trade in food-stuffs of every description supplied from the fertile south, hundreds and tens of hundreds of men thrown suddenly out of work being brought away, with their families, in Government vessels, to swell the ranks of the already large army of unemployed in the provinces more favoured by nature. With the main source of wealth thus suddenly cut off, nearly every other means of employment has fallen away, and the Government itself cannot find the money to initiate relief-works on an adequate scale.

But of what avail is it to enumerate our troubles? Let it suffice to say, once for all, that we are very hard hit in Chile; that we afford an interesting object-lesson illustrative of the infinite complexity of modern civilisation; and that this remote country can add its quota of misery and ruin to that laid at the door of those responsible for the war.

Since Valparaiso is not on the main road of travel and commerce, it cannot claim to be one of the caravanserais of the world; but, for all that, it contains the most curious medley of inhabitants that it has been my fortune to see gathered together in a town of its size. No doubt the coast towns of Peru can show a stranger mixture of breeds, where a special vocabulary has been coined to discriminate between fearsome blends of humanity. Valparaiso cannot, for example, produce specimens of mankind resulting from the intermixture of Oriental and Occidental types, as exemplified in the unbeautiful offspring of Chinese and aboriginal American, and of these again crossed with the negro. Our Chilean port can boast, rather, of its diversity of relatively pure types.

The majority of the population is composed, of course, of native Chileans—that is to say, of a race which is, in the main, of Spanish origin and speech. Even the upper ranks of society, where one would naturally look for racial purity, are by no means of unmixed blood, since many families number among their ancestors men of European nationality who rose to prominence at the time of the War of Independence, when so many soldiers of fortune—Irish, English, Scottish, and French—left unemployed at the end of the Napoleonic wars, flocked over to South America to take service with Bolivar and San Martin and Cochrane. The influence of this immigration is clearly shown by the frequency with which surnames of non-Spanish origin occur, and is

incidentally reflected in the names of Chilean warships: *Lynch*, *Condell*, *Prat*, *Thompson*, *O'Brien*, and so forth.

Looking back still farther, we find that the early European settlers in Chile were not all Spaniards. The founder of Valparaíso, then the Indian village of Quintil, was a Genoese—Juan Pastene. In the days of the conquest and the Indian wars soldiers of many nations followed the standards of Almagro and Valdivia; and at a time when there were but very few white women in the country a certain mixture with the native races took place, aided to some extent by the fact that the Araucanians used to raid the settlements for the express purpose of carrying off women. There is, therefore, a considerable strain of Indian blood in the Chilean people, and it shows up clearly in the appearance and habits of the lower classes.

The opening up of the country to commerce at the beginning of the last century brought in the British in ever-increasing numbers, and many of them made Chile their home. The Germans came later, devoted themselves with characteristic thoroughness to the commercial conquest of the country, and to-day, it must be admitted, threaten to supplant us in our position as the more influential foreign colony.

Since peace was made, though tardily, between Chile and Spain, the Spanish colony has rapidly increased in numbers and importance. There are many Basques, who have a reputation of their own as hard-headed men of business. The French, Belgians, and Swiss are numerous; but they are far outnumbered by the Italians, who almost monopolise the retail provision trade, starting in the humblest fashion, and in a few years embarking on greater ventures. It is quite rare to find a shop of any importance in Chilean hands. Time was, not long ago, when relations with the United States were strained, and the Yankee could scarcely get a footing. This state of things is altering rapidly. American influences are already powerful; and in the event of the war being prolonged, the States will have a great field for enterprise in every branch of industry. The Scandinavian countries are represented by a fine type of man, generally connected directly or indirectly with the sea, who contributes not a little to the cleanliness and prosperity of the ports of the south. At the other end of the scale are the Turks, who as travelling merchants are found everywhere. Santiago is their headquarters, where their shops fill a street. They and their Levantine relatives presented to the nation an imposing public monument on the occasion of the centenary celebrations in 1911.

The list is still far from being complete. I might go on for a long time enumerating folk that one associates vaguely with the Balkan States, Japanese curio-dealers, coloured gentlemen from the States in spotless shirts and collars, Chinese

slouching along in cloth caps and 'reach-me-down' clothing, indeterminate Polynesians 'from the Islands,' representatives of all the other South American republics, Russian sailors, and here and there, but with curious rarity, the inevitable Jew.

Occasionally a troop of gipsies arrive from heaven knows where, flaunting gaily coloured clothing, troubling the policemen, as ready to tell fortunes, to clear the washing-line, or to rob the hen-roost as they once were in any English village. Here, too, they practise the tinker's mystery, and are ready at all times, I understand, for a horse deal. Their appearance is the signal for lamentable outcries in the Press; and, sooner or later, finding the New World as inhospitable as the Old, they have to set out again on that endless, age-old journey that has carried them into every quarter of the globe.

Threading his solitary way through the crowd, one may see now and then the strange figure of an Indian herb-doctor, wearing a coloured poncho and broad-brimmed Panamá hat, and carrying his bagful of drugs and magical abominations slung over his shoulder. As he passes, with dull eyes and apathetic face, he brings vividly to mind an earlier, stranger South American world, for he and his fellows, the *calahuayas*, the travelling medicine-men, date from a time before the Spaniards came and before the Incas were conquered.

Among such diversity of nationalities, bound together by a thousand ties of trade and friendship, it may well be imagined that the outbreak of war produced a feeling of consternation. Valparaíso has never been an image of the millennium; but it may be said that before the war the minimum of interracial bitterness existed. Commercial jealousy there was in plenty; but, so far as I am able to judge, there was little of that settled animosity that has grown up in Europe to the point of ultimate catastrophe. When the dreadful news arrived the prevailing feeling was one of incredulity. All had lived in harmony under the Chilean flag, in well-marked colonies, it is true, but with many pleasant points of contact. It was a sight not easily to be forgotten on the memorable night of the declaration of war, when representatives of belligerent and neutral nations politely elbowed each other in the crowd before the notice-board of *El Mercurio*, and discussed the international situation with blank astonishment.

The bitterness, alas! came soon enough, with the financial crisis, strange news from Belgium, and the departure of young men by the hundred for the war. Then came the time for the pathetic break-up of old friendships, and for old acquaintances to eye one another sourly across the street.

By sea the war has come very near to us. One morning the bay echoed to saluting cannon when the *Glasgow* and the ill-fated *Monmouth* came

in, stayed their due term of twenty-four hours, and departed to the unequal fight off Santa Maria. Later we saw the triumphant ships of Britain's foes, and tasted the cup of bitterness in full when German ladies cast flowers in the path of Admiral Von Spee. Then these great war-vessels in their turn vanished beyond the skyline, sailing gallantly to their inevitable doom.

I should imagine that our shop windows are more amusing at present than those of the streets at home. Every phase of opinion on the war is freely represented. A German establishment with busts and photographs of the versatile Kaiser is frowned upon by a French shop with statuettes of Napoleon, and this, again, is supported by an all-British display of the most patriotic description. You may obtain pictures of the German war-fleet triumphantly blowing the British out of the water, or—the other way round. Down in the ill-paved streets of the old town, where the clash and jangle of musical-boxes sounds from a score of dingy cosmopolitan bars, feeling runs high, and is crudely expressed. The Italians exhibit their admirably illustrated but highly sensational journals, and in the windows of Germans and Austrians you may see British cavalry in full flight. There seems to be a fixed idea abroad that British troops of all arms wear the kilt and glengarry. Perhaps the most pleasing of all, however, are certain brightly coloured pictures representing Turkish troops in battle, brilliant in red fezes, and making havoc of hostile troops and battleships. Unfortunately these are not products of the Turkish imagination; in the corner of each may be read the illuminating inscription, 'Printed in Germany.'

A few words may be said on the vexed question of Chilean neutrality, on which subject unjust strictures have been passed in Europe. There can be no doubt that Chile has desired to maintain a strictly neutral attitude. It must be borne in mind that the policing of an interminable coastline, with territorial jurisdiction, including islands situated at a distance of several hundred miles from the mainland, is no easy matter adequately to effect with fewer than a score of available warships, and with naval estimates, none too lavish in normal times, reduced as at present by 25 per cent. To maintain absolute control of wireless stations in such a vast area is, frankly, impossible. It must be remembered, too, that Chile contains a numerous, wealthy, and influential German colony in the south, precisely where the land is most indented by an intricate and still in part uncharted labyrinth of fiords and 'canals.' German wits are keen to grasp an advantage, and the authorities have been hoodwinked a score of times, and in as many different ways. If it be any comfort to British readers, they may learn that the Chileans, most of whom have from the first shown sympathy

with the Allies, went wild with indignation over many flagrant breaches of neutrality, and the climax was reached when the news arrived that Von Spee had callously made use of the island of Masafuera as a naval base.

This particular wound to the national pride happened to coincide with a further cause of offence which directly touched the pockets of the *portefios*. The electric-car company, a German enterprise, was so undiplomatic as suddenly to double the passenger tariff. With the Chilean dollar at its depreciated value (standing to-day at sevenpence), the company was acting, it appears, within the contract stipulations; but it was very generally felt that the moment was ill chosen for making so drastic a change. A monster meeting of protest degenerated into a riot, trams were smashed up and burned, and much property of the company destroyed. Very speedily the trouble took on an anti-German aspect, and soon the windows of the consulate, German banks, companies, and a few private houses were in shivers. The disturbances lasted for two nights, and eventually the soldiers had to be called out, machine-guns and all, to support the police. There was a little shooting, but nothing to speak of—for us. The consequence of all this was a determined boycott (*un boicoteo*) of the tram-cars, which is still in force at the time of writing. Under the existing circumstances the affair has proved a godsend to the poor, and it has assisted not a little to relieve the situation. The Chilean of every class, having a great aversion to walking, misses the cars badly. To supply the deficiency an extraordinary assemblage of vehicles of every description, hastily converted into public conveyances, traverse the streets. The humbler carriages have plank seats; the more pretentious are fitted up more elaborately with garden chairs to accommodate their passengers in comparative comfort; but all are made gay with awnings of flags or coloured chintz, or have coverings of green boughs and flowers. In the meantime the German cars make their journeys empty, each with its police guard armed with his rifle for unprofitable passenger. It is very inconvenient, for upsets and collisions are frequent; but all is taken in good part, for it means the lucrative employment of hundreds of people who a short time ago were almost starving. Who could look sadly on a tumble-down cart bearing a placard with the inscription, 'Paris à Berlin ten cents'? The worst part of the matter is that there is very little consideration shown for the horses and mules, many of them in a miserable condition.

Such is life in Valparaiso in these dark days. It is an old custom of the port to welcome in the New Year with midnight uproar, with guns from the forts, rockets and Bengal lights in the town, and a pandemonium of steamer whistles and flares on the placid waters of the bay. This time the searchlights of the warships flickered over a

crowded anchorage where interned Germans and idle British lay moored side by side, friends and foes alike, bound by the evil spell that Europe has woven. On sea and land one thought was

present in all minds, and one prayer on all lips: 'May the coming year bring better fortune to the world, and God send a speedy ending of the war.'

M. CLÉRY, AND HIS 'JOURNAL OF OCCURRENCES.'

By PERCY F. BOYD.

IN the year 1798 there appeared an interesting account of the last days of Louis the Sixteenth, published by subscription, and written by a Monsieur Cléry, the King's valet-de-chambre during the period that unfortunate monarch and his family were confined in the Temple prison.

M. Cléry hints that it was with great difficulty he was able to prepare his memoranda; and as one reads his narrative describing the strict surveillance under which the royal family was kept in the tower of the Temple it becomes evident that the task of preserving his records must have been difficult indeed. He modestly disclaims the ability to write anything in the shape of a history of the brief but eventful period his narrative covers, and confesses his design is only to furnish materials for others who may be led to undertake the task. Nevertheless he claims for himself the distinction of being alone able to state with exactness the facts recorded in his *Journal*, as being 'the only continual witness of the insults which the King and his family were made to suffer.'

M. Cléry had been in the royal service ten years prior to the crisis of the 10th of August 1792, 'that dreadful day on which a small number of men overturned a throne that had been established fourteen centuries, threw their King into fetters, and precipitated France into an abyss of calamity.' He was in attendance on the Dauphin on that ever-memorable day. At six in the morning Louis the Sixteenth reviewed the National Guards, who swore to defend the King, but whom, with the exception of a small detachment who remained loyal, Cléry, returning later in the day from a hazardous tour of observation round the city, saw pouring out of the Tuileries. 'Sorrow was visible on the countenances of most of them, and several were heard to say, "We swore this morning to defend the King, and in the moment of his greatest danger we are deserting him."' Soon after eight the King was apprised of the fact that he could no longer rely upon the fidelity of the National Guard; and, yielding to the persuasions of the municipal officers sent by the Legislative Assembly, who impressed upon Louis that unless he acted upon their advice they would no longer be responsible for his safety, the King with his family left the Tuileries for the Assembly. Half-an-hour later the palace was attacked.

Cléry, left behind, made his escape by jumping from the window in the Queen's room to the

terrace below, and succeeded in eluding the besiegers. He took refuge in a stable belonging to one M. Le Dreux, who, appearing on the scene, prevailed upon him to stay in his house until the danger was over. He had on his person certain incriminating documents, which he had just time to destroy when a search-party made its appearance. At the suggestion of his protector, he pretended to be at work on some unfinished drawings which chanced to be upon the table. Fortunately for Cléry, they departed without the refugee incurring their suspicion. Soon after he learned the news that the King's authority had been suspended, and in the afternoon left his place of hiding, striking the road to Versailles, whither he chivalrously conducted to her relations a certain Madame de Rambaut, who had sought refuge in the same quarters as himself.

After various adventures on the road and some hairbreadth escapes, his impatience to know the fate of the King led him to return to Paris. On his arrival he discovered that the royal family had been removed to the Temple; and, learning that his post of valet-de-chambre to the Dauphin was vacant, and that Pétion, the Mayor of Paris, had been instructed to make an appointment, he preferred a request to be reinstated in his former position. His application was granted; and, after being searched, he was conducted to the tower, remaining there in constant attendance on the royal family until the ill-fated King was executed five months later.

Soon after his admission to the Temple, Cléry became valet-de-chambre to the King himself, at the same time continuing in attendance on the Dauphin; M. Huë, the King's previous valet, having been recently arrested along with former members of the royal household. The threat of a similar action in his case was conveyed to Cléry, who managed to avoid arrest by the exercise of a wise discretion, although on more than one occasion it came perilously near fulfilment. He describes minutely the apartments in which the royal family was lodged, and the manner in which they were accustomed to pass their time. Alluding to the daily siesta the King allowed himself, Cléry records in the following passage how he was affected by the scene: 'At four o'clock the King lay down for a few minutes, the family, with books in their hands, sitting round him, and keeping profound silence while he slept. What a sight!

A monarch persecuted by hatred and calumny, fallen from his throne into a prison, yet supported by the purity of his mind, and enjoying the peaceful slumbers of the good; his consort, his children, and his sister, with reverence contemplating his majestic countenance, whose serenity seemed to have increased with misfortune, and on which one might read by anticipation the bliss he now enjoys—a sight that will never be effaced from my memory.'

Cléry complains bitterly of the many indignities the King suffered at the hands of those employed to guard him, from whose surveillance, except for a few occasional moments, the royal family was never free. He describes them as addressing him with the most insulting epithets, and scribbling ribald phrases on the walls of his apartment; and narrates how one of the door-keepers of the tower, Rocher, whenever the royal family availed themselves of the exercise allowed them in the Temple garden, would, 'with a long pipe in his mouth, puff the fumes of tobacco at each of the party, and most at the Queen and Princesses. Some of the National Guard, amused with these indignities, burst into fits of laughter at every puff of smoke, and used the grossest language, some of them going so far as to bring chairs from the guard-room to sit and enjoy the sight.' It is pleasing to note there were a few exceptions, one humane sentinel suffering imprisonment for laxity in the discharge of his duties; but it is evident, according to M. Cléry's account, that the royal family was subjected to not a little abuse and persecution on the part of those to whom the charge of their persons was entrusted.

When it was decided to separate the King from his family, and transfer him to the great tower, while the rest remained confined in the small tower, Cléry accompanied his royal master to his new quarters. Orders were given that Louis was not to see or communicate with his family, and the same restrictions were imposed upon Cléry. The King endeavoured to obtain the concession that his valet might, at least, be permitted to continue in attendance upon the others; but the commissioners to whom he made the appeal remained obdurate. 'I was then in a corner of the chamber, overwhelmed with grief,' writes Cléry, 'and absorbed in the most heart-rending reflections on the lot of this august family. What fresh torture would not such a separation occasion the Queen!' Louis obtained permission to send to the Queen's chamber for some books, and Cléry was allowed to fetch them. When he entered the Queen's apartment he found her and her children overwhelmed with grief; 'it was no longer weeping and sighing, but the loud cry of sorrow.' Afterwards the decree of the Commune was rescinded, and the King was allowed to dine with his family and join them in their daily exercise.

At this point Cléry records a personal

experience which he feared would mean his own separation from the King. Responding to an inquiry by a sentinel on his way to the King's apartment, two officers accompanying him, he was surprised the next morning to find himself hurried to the Council Chamber for examination. The two guards and the sentinel were present. He stated the nature of the conversation that passed between himself and the sentinel, one of the officers confirming the accuracy of it. The other, however, declared that the sentinel had given him a missive, that he heard the crumpling of it, and that it was designed for the King. Later Cléry was arrested and conveyed to the Palais de Justice for trial. Fortunately the jury decided upon an acquittal, and he returned to his duties in the tower. He had been tried before a tribunal, however, appointed to sentence to death all who were found guilty by the court, and a few passing words with a sentinel had almost cost him his life.

Cléry's account contains some allusions to the extreme precautions taken against the possibility of any communication passing between the royal family and those without. The Queen and the King's sister frequently passed the time working at tapestry. Some of the finished work the former requested might be sent to a friend, the Duchess de Sérent. Assent was refused, as it was thought that the designs might contain hieroglyphics for the purpose of corresponding. On another occasion a draughtboard which had been sent to be repaired was taken to pieces on its return for fear there might be some communication beneath its surface. Margins were cut from devotional and other books, lest anything should be written upon them with invisible ink. For the same reason, all articles sent to and returned from the wash, together with the laundry-book and packing-paper, were held to the fire to ascertain if there were any secret writings upon them. Macaroons were broken and even fruit-stones cracked to see if they contained any communications!

At length rumours of the approaching trial of the King reached the ears of Cléry. He conveyed the news to his royal master with great difficulty, acquainting him that he had also heard he was to be separated from his family while the trial was proceeding. In due course the information proved to be correct, and the King was conveyed to the Convention for the preliminary examination, returning again for confinement in the tower. 'The Queen and myself,' Cléry reports the King's sister as saying to him, 'look for the worst, and do not deceive ourselves as to the fate preparing for the King. He will die a sacrifice to the goodness of his heart and love for his people. You, Cléry, will now be the only person with my brother. If possible, redouble your attentions to him, and omit no opportunity of giving us intelligence respecting him.'

They hit upon the following methods of correspondence. Cléry was to send the Dauphin every day a change of linen. Receiving one of her handkerchiefs, he was to retain it if the King was well; if ill, he was to include it among the linen; while the manner in which it was folded was to signify the nature of his indisposition. Subsequently written notes were exchanged between the King and his family, wrapped in little balls of cotton and smuggled into their different apartments. Later another plan was adopted. The wax tapers sent to Cléry for the royal use were tied up in packages. Cléry collected the packthread and managed to convey some to the King's sister. It was arranged that at night the Princess should by means of the thread let down letters to the window under her own, the said window being at the end of a corridor upon which Cléry's chamber opened, drawing up again replies from the King. Cléry used to manage to engage the officers in conversation at the time the exchange of communications took place, having first closed the door of the corridor, Louis evidently passing through Cléry's room to return to his own.

The time of the King's end was now drawing near. On Christmas Day, 1792, he made his will. The following day he again appeared at the bar of the Assembly. On Thursday, 17th January, his counsel, the venerable M. de Malesherbes, came to the tower and threw himself at the King's feet, sobbing. The Assembly, by a majority of five votes, had decided on the King's death. On the following Sunday the Executive Council arrived officially to communicate to Louis the decree of the National Convention. Cléry was ordered to announce their arrival. 'The King, who had heard the noise they made in coming in, had got up and advanced some steps; but at sight of this train he stopped between his chamber door and that of the ante-chamber in a most noble and commanding attitude. I was close by him,' writes Cléry. Then the fateful document was read to him. 'At the words "shall suffer the punishment of death,"' Cléry continues, 'the heavenly expression of his face, when he looked on those around him, showed them that death had no terrors for innocence.'

Carlyle does not appear to have had Cléry's *Journal* at hand when he wrote his *History of the French Revolution*. He cites, however, one passage, in a footnote referring to it as quoted in another source upon which he appears to have drawn. It is Cléry's affecting account of the last interview between Louis and his family. They were only allowed to see each other in a room having a glass panel in the door, through which they could be watched by the municipal

officers. 'They went in, and I shut the glass door,' writes Cléry. 'The King sat down; the Queen was on his left hand, Madame Elizabeth on his right, Madame Royale nearly opposite, and the young Prince stood between his legs; all were leaning on the King, and often pressed him in their embraces. This scene of sorrow lasted an hour and three-quarters, during which it was impossible to hear anything. It could, however, be seen that after every sentence uttered by the King the agitation of the Queen and Princesses increased, lasted some minutes, and then the King began to speak again. It was plain from their gestures that they received from himself the first intelligence of his condemnation.'

After the interview the King observed mass, and when this was over Cléry seized the opportunity of conversing with him. 'He took both my hands in his, and said with a tone of tenderness, "Cléry, I am satisfied with your attentions." "Oh, my master, my King," I cried, "the only reward I desire of your Majesty is to receive your blessing. Do not refuse it to the last Frenchman remaining with you." I was still at his feet holding one of his hands; in that state he granted my request, and blessed me. Then raising me, he pressed me to his bosom, saying, "Give it to all who are in my service."'

At length the fatal hour drew near. Cléry was standing behind the King when Santerre and the guard arrived. The King pressed his hand for the last time. "Gentlemen," said he, addressing the municipal officers, "I should be glad that Cléry might stay with my son, as he has been accustomed to be attended by him; I trust that the Commune will grant this request." His Majesty then looked at Santerre and said, "Lead on!" I remained alone in the chamber, overwhelmed with sorrow, and almost without sense of feeling. The drums and trumpets proclaimed His Majesty's departure from the tower. An hour later discharges of artillery and cries of "*Vive la Nation!*" "*Vive la République!*" were heard. The best of kings was no more!

With these words M. Cléry closes his narrative. England, to whose hospitable shores many a refugee from other lands has fled, assured of a safe asylum, gave him shelter, with his family, after the Republic was established. The old saying attributed to Marshal Catinat that 'no man is a hero in the eyes of his valet' finds an exception in the affection of Cléry for the ill-starred monarch whom he so faithfully served during the five sad months he was a prisoner in the Temple tower; and his *Journal of Occurrences*, written some six years later, bears witness to the place his royal master retained in the memory of one who remained loyal to the monarchy to the last.

THE SPY.

By Mrs STANLEY WRENCH.

NOISELESSLY as a shadow Hans Meunier crept along, his fierce black eyes peering into every blotch of shade and scanning every patch of moonlight. His work was over; the plans he had been sent to secure lay next his skin, wrapped in oil-paper thin as silk. A thrill of exultation ran through him. He had done what he had been sent to do. After all these months of careful planning and scheming he had won; and, as remembrance reached him of the dangers he had escaped, it was small wonder he took some pride in his achievement.

The whispering willows on either side swayed and bent, and to his over-excited nerves they seemed to hiss the same word at him as did the tall pollards on the marshes he had crossed but half-an-hour before. His tunic was caked with mud, for twice he had been forced to lie flat on the stones which, to those who knew it, made a pathway across the quivering bog; and, as he listened to the squelch of the mud around, Hans Meunier held his breath, wondering whether friend or foe were stealthily moving forward.

It was neither. A frog leapt into the shadows, croaking dismally; a duck amongst the water-reeds moved uneasily in her nest; again the willows whispered the taunt which the pollards had flung at him. 'Traitor! traitor! traitor! traitor!'—that was the burden of their reproach.

Once he paused to wipe the sweat from his forehead, although the night was cold; but something like a prayer of thanksgiving moved from his lips as he left the bogland behind and took to the road, where the cold moonlight made patches of light and shade. In another hour he might hope to come within hail of the outposts.

All at once a little whimpering cry broke on his ears.

Now Hans Meunier had seen and heard dreadful things that day, things at which his blood ran cold as he remembered. War was a dreadful thing; it had turned men into beasts, and his soul was sick as he thought of the misery of these poor peasants driven from their homes, hounded from place to place without hope or redress.

That little whimpering cry was close at hand now, and as he paused a queer irresolute look filled his eyes. It was a child who cried. Something seemed to clutch his throat, and his heart beat a little faster.

He looked behind him. The road lay like a long white ribbon, save where the trees cast their blotches of shadow. He turned aside to the alders that fringed the road, and for a second they seemed to check their whispering.

'Who is there?' he asked in French.

Something stirred in the bushes, and something, he knew not what, sent a nameless horror to his heart.

The whimpering went on—the dull, fretful crying of a hungry child that has cried itself sick with hunger. But there was something more. Some one else was there beside the child.

For one second Hans Meunier hesitated. These were strange and stirring times, and he could trust no one. It might even be a trap. The next minute he moved the bushes aside very cautiously. A pair of dark eyes, big with pain and terror, stared up at him; a white face gleamed in the moonlight; and a pair of lips moved, although without a sound coming from them. He stared down at the strange pair, for there were two of them—a young woman and her seven or eight months old babe. The babe continued to whimper, but in an exhausted voice, faint and oddly pathetic; the young mother's lips moved soundlessly, but that dreadful terror in her eyes cut him like a sword.

'Do not be afraid,' he said when at last he could find his voice. 'I will not hurt you.' He looked at the child, non-comprehending. 'Your child is hungry.'

Hans Meunier had three children of his own at home; their portraits even now reposed in his inside breast-pocket. The youngest, a boy of eight months, was about the size of this child; and, being a family man, he understood the meaning of that cry. 'Madame,' he said again, 'your child is hungry.'

A wordless sob broke from her lips as she tried to speak; but she made a slight movement, and the man started back with a cry of horror. Her right arm was broken; the other lay limply at her side, the fingers shattered.

'Oh, my God!' he cried, and put his hands to his face as though to shut out the sight. He had seen many dreadful things that day, had looked on many ghastly happenings, but none had affected him like this; and for a second or two he shrank back, his soul in a tumult.

The child's cry died away to a little sobbing breath, pathetic from so young a babe. The man bent towards the baby; but there were tears in his eyes, and as he stooped the woman saw them. A quick, quivering sigh of relief burst from her. 'Oh, monsieur,' she cried, when at last she could find her voice, 'you—are—a father?'

He grunted something in reply, unable to trust his voice just then, for the baby had seized upon the finger which he had thrust towards it, and was sucking it ravenously.

The woman saw this, and tears rolled down her cheeks. 'Monsieur,' she cried piteously, 'I think I am wounded even to death; but if you will raise him and lay him here that I may give him the breast he will cry no longer, my poor little one!'

With fingers as gentle as any woman's could have been, he undid the fastenings of her gown and laid the baby on her breast. Her eyes thanked him as the little hungry creature ceased its wailing; and, feeling in his inner pocket, the man produced a flask, which he held to her lips. 'Drink this,' he said. 'It will help you to bear the pain. When baby has had his supper I will see what I can do with your arm.'

But when he laid the child down and turned to her again, his heart was once more sick with horror, and a terrible struggle was going on within him. He knew there had been an attack that day on the village that lay slightly to the westward, a matter of three miles distant; knew, too, that the luckless peasants had been forced to flee, but they had gone in the other direction. Why, then, was she here?

Perhaps she guessed his thoughts, for she seemed to answer them when she spoke. 'I thought, m'sieu, if I could only cross the bog I should be safe,' she explained. 'You see, I know the way of the stepping-stones, and I did not think the Germans would follow. My house was the last in the village, and at this end, too. I think I lost my wits, and when my hand was shot it hurt too badly for me to remember things. I ran—God, how I ran!—without thinking which way, and found myself between the two armies. It was then, m'sieu, I crept into the bushes, and it was there I got hurt in my other arm.'

She paused for breath, and looked at him appealingly. He knew she took him for one of her own countrymen, or at least one of the Allies, for he spoke French fluently.

'M'sieu, I bless God for you!' she said simply. 'It hurt to hear my babe cry and to lie helpless. May God deal with you and yours as you have dealt with me this day!'

He spoke no word, only unrolled his little case of first-aid instruments and wrappings, and then, as he rendered what help he could, spoke only in monosyllables. But she was faint and weak; and, try how he would, he could not help giving her pain, although she bore it bravely. He was no surgeon, but a brief examination of her hurt showed him that if the left arm were to be spared it must be seen to without delay.

'Is there a doctor in your village?' he asked.

'He has gone,' she told him. 'He fled with the rest.'

He had expected this reply, and his brain was working fast. So far as he could judge,

and so far as his communications told him, the Germans were at a couple of miles distance beyond the demolished village, possibly some five miles in all. He was due to reach there that night, together with those stolen papers; he was expected even now. If he failed them—well, he knew what awaited a soldier who failed.

On the other hand, the French, in whose company he had been, and whose confidence he had won, were about three-quarters of a mile away, just on the other side of the swamp. If he went back—by this time his treachery would have been discovered—he would be shot as a spy.

He felt cold sweat break out on his forehead. Yes, he was a spy. That was a true enough designation. But a German is taught it is no disgrace to inveigle secrets from the enemy by fair means or foul. The honour of the Fatherland must come first; personal honour need not count.

But—and here was the cutting irony of it all—although a German soldier, Hans Meunier was really half a Frenchman. His father, an Alsatian peasant, had been killed in the '1870'; his mother, a German-Swiss, had remained near Metz, and had brought up her children honourably and well. She was happy in Lorraine; she had all a peasant's obstinacy, but all a peasant's indifference; and during the years that followed the war she gradually came to acquiesce in the German occupation, and she and her children were nationalised with the rest. She was given the choice of removing to her birthplace in Switzerland or remaining where she was under German rule, and she chose the latter, preferring to keep the little homestead and the two fields she and her husband had worked so hard to gain.

Perhaps this very thriftiness of hers was her greatest fault. She might have sent her son to France when he approached manhood, so that he should not serve in the German army; but she had no thought of war coming so soon, and so—and so—here was he (a man whose father had been shot by the invading Prussians) one of those who had served his appointed time under the same colours they had carried, one of those selected for work dealing with espionage even before the outbreak of war.

The peasant, the world over, accepts without comment the orders of those placed in authority over him, and rarely does he dream of challenging such command. Hans Meunier had come of peasant stock for many generations; it is doubtful if he had ever given the matter of his calling much thought. He had accepted it with the stoical indifference of his kind. Now he was face to face with a fearful dilemma.

Back in the French company he knew there was a famous surgeon, a man whose name was

of world-wide renown, but who had given up everything for the honour of his country, and was working night and day for the relief of the wounded. Hans knew his marvellous skill, had watched him at work; and the knowledge reached him now that not only would this woman's babe be saved, but her life too, provided he could convey her there in time.

Time!—there was no time to waste. He knew the signs only too well. Had not he, in order to secure those papers, worked tirelessly, helping Caulloux the surgeon on the battlefield? He realised there was not even time to go there and back, bringing Caulloux, even if he would come.

A cold sweat broke out on his brow. If he would come! Was it likely? He, a spy, a deserter—was it likely Caulloux would accompany him? At last the thick hide of the peasant was pierced. He knew himself for what he was, and in that same instant a flash of bitter remembrance smote him. They would shoot him for a spy. Well, well; but here came the bitterness of it all. He deserved it, for was he not Alsatian? Was not his father a Frenchman?

Swiftly all these thoughts raced through his brain. Swiftly he made up his mind. 'Madame,' he said, turning to the woman, 'it is not good for you to stay here. To-morrow, when reinforcements come up, you will be in the direct line of fire. I must carry you and the little one to safety.'

She looked up at him with grateful eyes. 'May the good God bless you, m'sieu!' she breathed.

Then began what proved to be rather a painful business. Unrolling his knapsack, he took from it a strip of webbing, which he used to bind the baby fast to her. She looked up at him interrogatively, but could not refrain from a little moan of pain as he moved her broken arm.

'I am going to carry you both,' he said, 'but I will not risk having the little one on my back, madame.'

Very slowly, very cautiously, he hoisted her in his arms. She was a little woman, and quite light; but Hans knew that even a light burden may become a heavy weight after a time; and, since he could not possibly set her down to rest his arms whilst crossing the swamp, it behoved him to get her fixed as comfortably as possible before they started. He spoke of this to her, and heard her teeth grit as she raised herself a little higher against his shoulders.

'Courage, madame!' he said. 'It will not take us long to cross the bog, and on the other side is a clever doctor who will set your arm without trouble.'

'You are very good, m'sieu,' she murmured. 'God will reward you.'

Down the road he strode, a queer feeling in

his heart as he realised he was journeying back over the same ground he had traversed scarce half-an-hour before. The willows hushed their whispering, the alders no longer creaked their reproaches, and the pollards had ceased to taunt him as traitor. Instead, a dreadful silence seemed to reign, and he could hear the echo of his own footsteps on the straight moonlit road. He could feel her woman's heart beat, and hear the satisfied breathing of the child, and his thoughts flew to his own wife and children safe at home, please God! For a moment he stood still. Should he go on? To go forward meant, without a doubt, that he would never see them again.

A dreadful vision danced before him like a mocking kinema film. He saw himself blindfolded, saw the row of men with rifles raised, saw the guard, heard the word of command, the click, the ghastly thud, and knew it was no fancy picture. It was what must happen. Yet he went on, although he knew he walked to his doom.

Squelch, squelch! The huge stones moved uneasily, the reeds whistled, and as he passed gingerly from one half-submerged boulder to the next he felt the woman's weight gradually deaden, and guessed that she had fainted through sheer pain and exhaustion. He dared not pause to gain breath; but once, when the sleeping child made a little slobbering noise, tears sprang to his eyes. Again he pictured his own dark-eyed son asleep at home.

The bitter lines deepened round his mouth. His eyes were set and sombre. No challenge greeted him as he managed to climb the bank with his burden, and a long, quivering sigh escaped him as, stooping to avoid the low-hanging trees that masked this portion of the marshland bank, he took a dozen steps forward.

A dry twig cracked beneath his feet; the sentry's challenge rang out, and he answered. But a cold sweat broke out over the whole of his body. In another ten minutes it would be all over. It was not too late for him to draw back, although he would run grave risks. He would be shot as a spy, but he had redeemed his honour. At least he would die as a man.

It was all over. The tired little mother lay back with white, exhausted face and closed eyes, her babe beside her; but a beautiful smile flickered round her lips. She, too, had heard that story, and she, being a woman, understood far more than did the great surgeon who listened with grave face—listened, and judged with a stern man's judgment. She remembered how gently the man had thrust his big brown forefinger into the child's mouth and stopped its crying, she remembered too the almost reverent fashion he had laid the babe upon her breast, and she likewise remembered how he had grunted

assent when she asked if he had children of his own.

'You will consider yourself under arrest,' said the surgeon curtly.

Hans Meunier nodded drearily. But when he thought no one was looking he drew out those portraits of the children and their mother, and gazed at them with big sombre eyes full of tears. The tears were not for himself, but for them.

The woman, who opened her eyes at that instant and saw him, understood once more.

When the surgeon reappeared Meunier thrust away the portraits with an awkward gesture, and stood at attention.

'These German pigs,' thought the surgeon, 'show no fear.' Was he a German? Already thoughts began to trouble him. It was worse to believe the man a traitor. It was then he caught the imploring look in the woman's eyes, and, being a Frenchman and easily reached by such an appeal, moved towards her.

'What is it, madame?' the surgeon asked in a low voice. 'Is there anything I can do for you?'

'M'sieu,' she whispered, 'that man is brave. He is not as you think. He may be a spy—yes—as you count a spy; but he is a brave man. Think to yourself, m'sieu, what it means. He had no need to bring me here to safety. There was no reason he should try to save my child. But he is a good man, a brave man, and honourable. He has a wife and children of his own.'

She had beautiful eyes, this brave little woman, who had borne all his ministrations without crying out or flinching. He was as susceptible as the rest of his race, even in war-time, and he hesitated.

'Surely, m'sieu,' she pleaded—'surely, m'sieu, you will not have a man shot as a spy who gives up his life willingly for the sake of a woman and her son who will one day fight for France.'

The surgeon looked at the sleeping babe. He, too, was a father, and his stern mouth quivered. He turned to Meunier. 'Have you children?' he demanded curtly.

'Yes, m'sieu,' came the answer.

'How many?' he asked.

For reply the spy handed him the portrait. He looked at it; then something else caught his eye.

'Lorraine!' he cried. 'You come from Lorraine? And you fight against France!' he exclaimed.

'M'sieu,' cried the spy, his face scarlet, 'm'sieu, I will expiate to-morrow.'

Caulloux was not a soldier by training. Perhaps had he been a military man by profession he might have acted differently. Perhaps he recognised the peasant—and the man—for he put out his hand. 'Give me your hand,'

he said. 'You shall get your chance. There is something to be done to-night which needs a brave man. But he takes his life in his hand.'

Swiftly he explained, and a light crept into the other man's eyes. 'M'sieu,' he said simply, 'I will go.'

They did not shoot him at dawn. As Caulloux had said, he took his life in his hand; but as they lifted his body reverently men bared their heads.

'He was a brave man,' said some one.

'A hero,' whispered another.

'He gave his life for his country, and for us,' said a third.

For the enemy's position had been located in time, the French were triumphant; but there were two people who knew the truth.

Like the rest, Caulloux bowed his head. 'After all, it is not given to every man to atone so nobly,' he murmured.

But the little dark-eyed woman wept, and as her tears fell on the face of her sleeping babe she sought to blink them away.

*'Allons, enfants de la patrie,
Le jour de gloire est arrivé.'*

she crooned. 'Ah! oui!' she repeated, 'he was a brave man, and thou, *mon p'tit*, shalt grow up all the better for his example.' Outside she heard his comrades singing '*Mourir pour la Patrie*,' as they carried the spy to his last rest. 'A spy!' she murmured. 'Ah, no! he died for his country, and for us, little one. Let us not forget.'

TRUE SERVICE.

'I serve'—the Motto of H.R.H. the Prince of Wales.

NOT with the power of tyrants, keen to slay,
Where hate and vengeance side by side appear;
But with the kingliness of honour's sway,
Whose oath is sacred, and whose bond is dear.

The bulwark of the nation shall be truth;
The 'greater love' that makes this life sublime
Shall prove that friendship is no boast forsooth,
But brotherhood enduring for all time.

Sons of the Empire! brave and strong of limb,
Ye know, ye mighty men of iron nerve,
Power sitteth best upon the front of him
Who sheweth best the noblest way to 'serve.'

The dauntless lion yields not to the foe;
The valiant hearts that fight, as fight they must,
Stand resolute, unwavering, for they know
No death can hurt us like the death of trust.

Britannia! stainless, fearless be thy hand,
Ready, with courage that can never swerve,
To vindicate to all on sea and land
The right to rule by love, the right to 'serve.'

SEVENTH SERIES

RUSSIA AND THE WORLD.

By A. FRANCIS STEUART.

RUSSIA, limitless Russia, has for long had an attraction beyond compare for the West. There was the vast plain, the forest peopled by wolves and bears, the scanty populations who spoke so curious a language, the absolute power of the Tsar and his favourites, and, lastly, the patience of the varied peoples under their ruler—the modern representative of the Byzantine Empire.

All the rest of Europe—save Spain, Portugal, and Sicily, which had their Moorish conquest, and Greece and its adjacent countries, which have been gradually freed from their Osmanli conquerors, until nothing remains of the once great Othman Empire in Europe save Turkey in Europe itself, which is now a seat of war—has developed in a different way. Latin civilisation has been welded to Gallic or Teutonic, and in each country the feudal system has been the result, with many racial modifications. Russia has had no feudal system. She began as a lot of Grecianised Slav states, cut off from the West by Catholic Poland, and then suddenly swamped, and all intercourse with Europe crushed from 1224 to 1480, by the Tartar conquest. This subjugation and bondage by the Tartars (who became Moslem during their rule) was only broken by the tact and diplomacy of the Grand Princes of Moscow, who bent the knee to their alien masters to become supreme over their own people. Liberation began with Ivan the Great, and continual Slav successes rendered the Tartars a weak people, until with Ivan the Terrible came the conquest of the Tartars of Kazan in 1552, and the beginning of the acquisition of the future empire of Siberia. On Ivan's son Feodor's death, in 1598, the unlucky Russia was again thrown into misery. There was a disputed succession to the tsarate. Our King James I. and VI. had a chance, so much was it thrown into hotchpot. At last, after a desolation worse than can be imagined, the result of internecine war and the inroads of the Poles, the popular family of Románoff gave a Tsar (Michael Feodorovitch) to Russia, whose descendants still reign, and whose successor, the present Emperor, Nicholas the Second, Alexandrovitch, held the three hundredth anniversary of his ancestor's accession two years ago.

Since the Románoffs succeeded, the history

No. 232.—VOL. V.

of Russia has been curious. Peter 'the Great' woke up to the fact that Russia was cut off from Europe. By defeating the Swedes and founding 'Petrograd' in 1703, he 'opened,' in his own words, 'a window into Europe,' and he reformed the constitution of the Orthodox Church, while he still remained, in spite of foreign 'helpers'—many Scots—a typical Slav autocratic Tsar. His four women successors were different. Chaos under the first emerged into rule by German foreigners under the two Annes. Under Elizabeth Petrovna, his daughter, Slavonic Russia held full sway. Her nephew, Peter (of Holstein), leant on Frederick the Great of Prussia, and tried to Prussianise Russia. This policy was reversed when his widow, Catharine the Second (born a German Princess of Anhalt-Zerbst), usurped his throne; and during her reign foreigners, though welcomed in Russia, were not given prominence unless they conformed to the ways of the country, and the conquerors and many favourites employed by her were all Slavonic. Then came the nightmare rule of her son Paul; then the invasion by Napoleon in 1812 (what a wonderful idea, and how wonderfully achieved in spite of its result!), and the growth of Russia in Siberia and Caucasia. Then (touching us more nearly) came the Crimean war—how many of us can tell what it was about? The assassination of a Tsar shocked us all, but took away a possible rival in Asia, as we thought then. Very recently a destructive and disastrous war between Russia and Japan was waged—and in this war we kept our minds open—with the latter as victor. Now, in 1915, we find Russia, as protector and ally of her Slav sister Serbia, once more united, and able, with popular acclamations, to enter the European Armageddon as ally of France (with whom she has had many flirtations), Belgium, her kinsfolk in Montenegro, her former enemy Japan, and, lastly, with her rival in Asia, Great Britain, in the present international war against Germany, and more especially against Germanic *Kultur*.

This welcome change in our relations with Russia which the melting-pot of time has brought about makes us not only wish to be friendly with our ally who rules over the East from Warsaw to Vladivostok—her country includes European peoples, Poles, White Russians, and

[All Rights Reserved.]

MAY 8, 1915.

Lithuanians, Muscovites, Kirghiz, and Tartars, the fierce Caucasian tribes, and the quiet Finns, as well as all the Asiatic Mongolian and Turkish tribes in the course of Russification—but also to understand her and the peoples of her Empire better. We can be helped to do the last, I think, if we read a recent book called *Russia and the World*, by Stephen Graham (Cassell & Co.). The writer is a pronounced and distinguished Russophil who has made a study of the Russian Slav, whom he knows and loves. Widely conversant with Russia and Siberia, he has also made a pilgrimage with the Russian pilgrims, whose religious spirit and culture he understands and appreciates; and, more than this, he can tell his experiences to his readers in delightful sentences which at once awake interest and rivet the attention.

The author was in his beloved Russia—but in an Altai Cossack village in Mongolia—when the war broke out and mobilisation began, and he gives a wonderful picture. The knowledge that the war was 'a holy war' inspired the people to the desire for heroic deeds, and everything proceeded with zeal (he mentions 'the Cossacks' delight in the cutting off of heads'), and the army was consecrated (how foreign this sounds, and how Russian!) as 'the slaves of God.'

The centuries of serfdom have given a wonderful equality to Russians. Before the liberation of the serfs by the Tsar Alexander the Second in 1861 one was either 'a soul' (serf) or an owner. The rank of the latter did not much matter, and the former had none. Now the owner has, as such, disappeared, and the only recognised rank in Russia, outside a few old families, is that of the *tschin*, or official rank. In all ages intermarriage between every class (how un-Germanic this sounds; how unlike the necessity of equal marriage, the *Ebenbürtigkeit*, which has made so much misery in Germany!) has been allowed in Russia, and in former times the Tsaritsas were frequently daughters of simple landowners. I venture to assert there is now little difference in rank except by 'set' or personal choice. Some friends of mine had a cook who was *knaeginia*, or a princess. She was quite illiterate, yet her passport showed that she was a real 'princess' and bore an historic name. This unity of the Russians is well brought out in *Russia and the World*; and since the war commenced one finds that (as with us) the political feuds are healed at least for the time. The *intelligentia*, or 'student' class, who have so often fomented revolutions, no longer speak of the hangman's halter as the Tsar's 'necktie,' but are their Tsar's most faithful subjects; the Poles, promised liberty, and understanding the Slav dream of Russia better than Germany's 'blood and iron,' are wholly with their conquerors; Siberia has for the present given up thoughts of Home Rule, and has sent her hordes to the Western war; the Jew—a

blessing which Russia owes to medieval Poland, and one which has caused a problem of which it is difficult to see the solution—is fighting also *con amore*; the worst enemy, drink, is scotched just now, if not entirely killed, by the suppression of *vodka*; and all this unification has been brought about by the desire of Russia to realise herself and offer her life's blood in opposition to the Germanic idea.

The writer of the book points out that 'of all nations, the most abhorrent to the Germans must be the Russians;' and he is right. The Russian is dreamy (his steppes have taught him that), patient (he owes this to autocracy and long years of serfdom), and, above all, religious. He has done terrible things in his history, partly owing to his Tartar subjection, but he has never lost, as the German has at present, the divine gift of Pity. Sad stories of captivity—and Russia teems with these dating from the days when Siberia was the 'reward' for a hastily spoken word—have never ceased to interest and inspire the people, and to fill the land with melodious music and song of wonderful cadence. Tolstoi, Dostoieffsky, and Tchekoff were filled with a gospel of sympathy. Turguenieff was inspired by the same theme; and, satirically turned, it is found in the witty Gogol also. The modern school of the *intelligentia*, the sex school of Artsibashef and his followers, are swept away by the war, and leave the writers with broader foundations unmoved on their pedestals of knowledge, sympathy, and pity.

It is not for me to deal here with the Orthodox Church save to say that it has an immense power over the Russian *moujik*. The formality of its gorgeous ceremonies does not prevent his ecstasy having a spiritual outlet, and the general want of culture of its clergy has not made him wane in his high ideals. The whole religious idea is still Byzantine, and Holy Moscow is yet—in spite of certain Tartar débris which all good Russians deny—the modern Byzantium and the capital of Russia, whereas Petrograd is but a recent and international mushroom town.

Russian civilisation is not rigid and formal like that of modern Germany. It is impressionable and ready to absorb a foreign idea, but to make it Russian first. Where is there a theatrical school or ballet like the Russian? Yet the latter was French once. It is more like our own culture, which has for its motto, or might have, 'Go as you please.' For this reason Germany has always been opposed to Russia; and what the latter owes to her has not, like the Biron régime—that of Büren von Kurland, the favourite of the Empress Anne (from 1730–40)—been for her good, and assuredly has not been for her happiness.

But the war, although uniting Russia, does not leave her (as this book points out) without problems. If Germany is safely and surely defeated, and the *Kultur* idea put into the limbo of forgotten things by the satisfied Allies,

she has still a few things to put in order in her own house. The liberty of Poland is the first; the lightening of her hand on the Finns is the next. The alleviation of the state of the Jews is more difficult, for, if one knows them both, how can a Russian be made to love a Jew? Then there is the possible recrudescence of the drink problem, now removed, or else the necessity of finding an amusement (our author suggests

music, in Russia a true passion, which is a good idea) as a substitute. Lastly, there is the necessity (and the zeal for it is now a welcome sign) of the spread of an enlightened education.

For the knowledge that such things are in the air, and our ability to understand them better, with instruction on a thousand other wider problems, we are indebted to the author of *Russia and the World*.

THE BRIGHT EYES OF DANGER.

CHAPTER XXIV.—STRATAGEMS AND SPOILS.

WE walked round the house and examined the footmarks. The rain had blurred them, but it was plain that there had been a party of three. This tallied with the number we knew—Macdonell, Innes, and the dead man. There were only traces of two on the path towards the Cove—the toeprints of running men.

'These two fled by the Spaniard's Cove,' said De Boux. 'They must have a knowledge of The Garth. How Cousin Philip traced us is a mystery. But he is—what you say?—double—*trompeur*! Philip of the Left Hand, as Charlotte calls him.'

We made a strict scrutiny of the shrubbery, but saw nothing, and then went into the wood, where I found my mare tethered where I had left her. I was glad enough to turn towards the house again. Hitherto the call of my wits to action, self-preservation, one danger following on another's heels, had braced my nerve, but now I was conscious of a rebound. The place had become alive with phantasies; the very rabbits hopping in the brackens made me jump.

Bertrand laid a hand on my shoulder. 'Your gills are too white, monsieur—*mon ami*! When did you sleep last?'

'Truth to tell,' said I, 'I could sleep, I think, for a week.'

'There shall be not a word of our story, or yours, until we rest. As for me, name of a'—

He broke off with a great yawn. After we had seen to the mare's wants we came back to the house, and I threw off my boots, lay down in my clothes on the couch, and did not open an eye until three o'clock in the afternoon.

Outside The Garth the sun wove a bright pattern through the trees; leaves trembled in the faint golden air of late September; the arch of the sky was serene and cloudless. It was a day to make one give thanks for life. As I beheld its peace, last night's doings seemed as unsubstantial as the dissolving glimpses of a mirage. But my aching head was no illusion. The shattered pane I looked through at the nodding branches, the blood-stains on the window-sill, told their own tale, the sight of them renewing

my eagerness to piece together the whole affair and pursue it to the end.

The last two days had been momentous. Adventures had leaped out on me as suddenly as highwaymen. I had held my breath, watching the clash of battle; my life had been twice in peril; I had killed a man. Yet my thoughts ran less on the dangers I had met than on the moment when I had learned from the girl's lips that Bertrand was her brother, and her hand—her little unsullied hand—touched mine.

The murmur of voices reached me. On the path below the window the brother and sister were pacing, their faces very grave. Bertrand looked up, and, seeing me, beckoned.

'Without doubt, Mr Layton,' said he when I joined them, 'we have been on the brink of tragedy, and are not safe yet. I feel in my bones that more must happen. Charlotte and I intend to tell you our story. You may help us, and we owe it to you—to your courage and your services—to be frank with you. The three of us may unravel the tangle. It concerns the honour of Glenira and our family.'

'It is safe with me,' I answered.

'I—we know it,' said the girl; and the words rang sweet and kind.

'It is possible that I may be of service.'

'Pray God it be so!' said De Boux, his voice vibrant. 'Glenira is a man of honour; but—the pity of it!—he is unable to speak, much less act, for himself. Fate has been scurvy enough to take the reckoning with his enemies out of his own hands; but, as I live by bread, I shall settle with them myself.'

Under the arch of the beeches I heard the story.

'Glenira, the blind man whom you saw, is Ian Macdonell of Glenira, on Speyside, a cadet of Clan Donald, and the eldest of three brothers—Ian, Hector, and Hugh. At the "Fifteen" he and his brother Hector came "out" for King James. The youngest brother, Hugh, stayed at home, and made allegiance from the teeth outwards to King George. Such a family arrangement was not uncommon for the safety of landed estates in those troublous times. But the Rising was broken.

'Glenira and his brother Hector, disguised as sailors, escaped to France. The estates were forfeited; but the Crown gave a grant of them nominally to a cousin, but in reality to the youngest brother, Hugh. Glenira remained single, but Hector married in France a daughter of another outlaw, a Maclean from the Hebrides; and Charlotte is their daughter. Her father died in exile, and his widow married my father, Victor Foudelle De Boux, a gentleman of the Court of King Louis. I am their son, and half-brother to Charlotte. My father and his wife died when we were children; and, as Hector Macdonell wished, Charlotte was brought up by her mother's kinsfolk in the West Highlands, and I was at the Scots College in Paris, where, although I passed many an idle day, I learned English.

'For the first two or three years after the "Fifteen," Hugh (under a liberal payment for his stewardship) sent the rents of the lands of Speyside to his exiled brother. The payments began to dwindle, and excuses were soon followed by silence. Glenira was, and is, a proscribed man. To return meant death, or at the best the plantations. His legal rights were less than none. All he could hope for was a second Rising by King James. But the years passed. No second Rising came, and Glenira, soured and disappointed, became a soldier of fortune, and never set foot in Scotland again until last month.

'In May last Glenira sent for me from Bar-le Duc, and there I found him closeted with a tall, strongly-built young man.

"This is my brother Hugh's son Philip, and an honest man than his father," said my uncle in his brusque way. "I look to you two to be friends. He brings credentials, and is entrusted with duties befitting a Macdonell. We are soon to hear great tidings from Scotland; and, please God, I may see the heather again, and—when the time comes—die under my own roof beside the Spey."

'I saw much of Cousin Philip during the next month or two. He made many friends, for he was good to look upon, had a merry laugh, was ready with a song or a jest, and was well supplied and generous with money. There were many poor Scots gentlemen in Paris, and Philip's qualities served him in good stead. He was popular in a fashion; but I used to wonder where the money came from. I do so yet, and I have my own thoughts!

'Charlotte came to France from Scotland, and Philip fell in love with her. It is the only thing to his credit that I know. I speak freely, monsieur. The marriage would not have been unwelcome, for we were, and are, poor—oh, but poor!—and Philip, it seemed, would fall heir to the Speyside estate whether the Stuarts came to their own again or failed. But *la petite* distrusted him—would have none of him. Her woman's instinct was right, for the story is of sorry treachery.

'Glenira, like all the Scots exiles, was eager to help the Chevalier. Money was raised through Lord John Drummond and Monsieur Waters the banker in Paris—a goodly sum, not less than twenty thousand louis d'or; and Glenira, accompanied by Philip Macdonell and his creature Innes, sailed with the money to Scotland for the Chevalier.'

A thought, swift as a flash of light, made me catch my breath. The secret paper with its rude sketch of a ship!

'The ship was the *Mary of the Angels*?' I hazarded.

For a moment or two he was speechless with surprise.

'Ah, monsieur, this is strange! In English that would be the name; in French the *Marie des Anges*. I saw her sail from Harfleur. How came you to know this? But I shall finish my story, for I am on thorns to hear yours.

'Charlotte was with relatives in the Hebrides when Glenira sailed. The intention was that I should join her at The Garth, and take her back to France until the horizon of affairs in Scotland cleared. But one day comes to me in Paris a seafaring man, well known to the Jacobites in France, Anthony Brander by name, a staunch and secret fellow, smuggler though he may be. His buckkar, the *Gannet*, had put into Stonehaven after a "run," and next day the *Marie des Anges* dropped anchor in the little harbour. Glenira sought Anthony out, and gave him a sealed letter to be delivered to me with all speed. It told me that Philip Macdonell and Innes had played him false. Their proposal was nothing less than that the three should divide the French money and scuttle the ship. Fearing foul play, Glenira feigned to agree; but when the *Marie des Anges* ran into Stonehaven to shelter from a gale, the two rascals went on shore a-junketing. He then sent the letter by the smuggler telling me of their villainy; that he had seized the opportunity, when the two knaves were ashore, to cut sail without them, risking the weather; and that he was to make for Inverness with all speed to hand over the money and join the Chevalier. So far so good!—And now, Charlotte, do you string some beads to the story.'

'My sorrow!' said the girl. 'That it should be told! But here it is, and we must face it. I came from the North to meet Bertrand here, the two Highland servants with me for company. One night came a knocking at the door, and I heard a voice, "Open! open!" I was not afraid, for I would know Glenira's voice among a thousand. It was he, but like a dead man walking. He was alone. How he had reached here, God knows! He could no more than grope his way, for he was nearly blind, and a great wound, newly healed, showed on his forehead. And his voice was like a child's. "Hide me! hide me!" he would call; and again, "The money! It is not mine! Not mine!" But

little more did he say, for plain it was that he was out of his mind. Between us, the men and I contrived to look after him, and I got a surgeon from Edinburgh to see him. But he shall never see again, and his secret is like to die with him. Ah! the darkness and cruelty of it!

'And he has let nothing fall concerning the interval between his leaving Stonehaven and coming here?' I asked. I was beginning to see a little more daylight.

'Not a word! He paces his room silently, a sorrowful sight,' said De Boux.

'And the man whom I rescued from the servants on the day when I first saw The Garth?'

'He was watched prowling round the house, and ran when challenged. A spy of Left-Hand's, depend upon it! I should not be surprised if Philip (concluding that Glenira had stolen the whole of the French money) had The Garth watched, for Glenira knew the house in the "Fifteen," and Philip guessed that it might be a likely hiding-place. I arrived at The Garth the day after your night in durance there, in time to send a bullet after you. *Ma foi!* 'twas lucky my pistol practice was bad! Several days passed while Charlotte and I waited here with Glenira; but nothing happened, except that the *Gannet's* master and I exchanged signals on the day after Preston, by which I know that she is North, and will put into the Fifth soon. Then came the night of the rain-storm.

'The two Highland servants had gone to join the Highland army, and we—Charlotte and I—were alone.

'It was not very late, about half-past ten, but all the candles were out except those in the hall, where we sat by the fire. The rain made an incessant beating outside. We got no warning of what was to come, not so much as a footstep. A cold draught of air flickered the candles, and quite suddenly Philip Macdonell and Innes appeared from the shadows. All the doors had been bolted, so they must have known the secret entrance by the tidal cave.'

'The one I escaped by!'

'The same, monsieur! Their plans had been excellently laid. I started up; but I was weaponless, and Philip could have broken me over his knee. As it was, I got the butt of his pistol twice on my head, and remember no more until next morning, when you came to the room they had locked me into.'

I turned to Mistress Charlotte. 'And you? Was I too late? Did they maltreat you?'

'No more than you saw. Left-Hand knew we were defenceless, and said so. The coward! "I know Glenira is here," he said, "and I have serious business with him." Of course Bertrand had told me of Glenira's letter to him in Paris. "I know your business. You want to find out where the French money is." "The money he stole," said Innes; and at the words I struck

him with my open hand on the face. "Serves you right, Roderick," said Philip. "Though what he says is true, Cousin Charlotte." Then he tried blandishments and threats—how he could denounce Glenira to the Chevalier as a thief, and to the Hanoverians as an outlaw, and so forth, as though I were a child. I answered him as he deserved, and when I finished, never had I seen a man with brows so dark. "We shall deal with the little French cub afterwards," he sneered. "As for you, my fair cousin, you must be kept as quiet as he is, unless you tell us all you know concerning Glenira. But I may as well tell you that we know more than you do."

'Were that true, I told him, then he could lose nothing by my silence, and I refused to break further speech with him, though he asked me a hundred questions. In the end, they gagged and bound me, carrying me to the room where Bertrand and you found me; and the last thing I remember was my cousin Left-Hand jeeringly asking my pardon for taking possession of the house for a few hours. In the darkness, alone, I swooned. Then you came.'

'Not a moment too soon,' said I fervently. 'I think I see farther than I hoped into this sordid business. When I was waiting in the tidal cave I saw Glenira.'

'Saw him!' came from both.

'He must have known of the cave long ago, for without doubt I saw him.'

Then I told them all—the blind man hiding the paper, and my reading it, and replacing it before I escaped.

'You put it back?'

'I did.'

'And we are standing here. Come, let us find it.'

He led the way into the house at a half-run, and the three of us—for Mistress Charlotte declined to be left behind—went to the chamber that once had been my unwelcome lodging for a night. The exit by the big fireplace was easy, and soon we were standing in the cave.

'There!' I pointed to the boulder. De Boux and I heaved at it until it swung slowly out of its socket. He dived his hands feverishly into the sand, to stand up and stare blankly at us. There was nothing there; nor was there a trace of the packet, although we made a thorough search. Round the cave were heavy footmarks.

'Two men!' said I bitterly, looking at them.

'We are beaten! Beaten!' came from De Boux.

'Not yet. I took an exact copy of the paper. It is in the hands of a decent lawyer in Edinburgh, and I shall bring it to you to-morrow. We are not beaten yet, for the paper, though in part illegible, shows a rough sketch of a ship, and, among others, the words "Mary of the

Angels," "De Boux," "Bar-le-Duc," and a cross marking high-water.'

'It means,' exclaimed Bertrand, 'that Glenira, for some reason, has hidden the French money. He is guiltless! I know him—know his great heart, his loyalty to the Stuarts, and the bitter price he has paid for it. It means that Left-Hand and his cur Innes are on the track, and have somehow or other found the hiding-place of the paper.'

'Unless Glenira, fearful of this, himself changed its hiding-place.'

'Monsieur, it is impossible. He has been too weak to raise his head. But this is to no purpose if you have a copy.'

'An exact copy,' I said.

'Probably the enemy has stolen the original, and has one day's start of us. But the *Garnet*

will be in the Firth in a day or two; and, if I know Anthony Brander at all, he and his crew are at our service, and we can reach the North before Cousin Left-Hand. Further, if (as the surgeon thinks) Glenira should recover his memory even a little, we shall be able to go straight to the wreck, instead of quartering every mile of the coast, as the two knaves must do.'

We discussed this plan and that for long, and in the end—after, I am afraid, a wholly insincere protest—I accepted the invitation of the brother and sister to take up my quarters meanwhile at The Garth. And my heart was light as I rode back to Edinburgh for my copy of Glenira's chart, although I knew we were on the threshold of a contest of wits and courage with a cool and ruthless enemy.

(Continued on page 371.)

THE HEART OF A CONTINENT.

By Captain P. T. ETHERTON, F.R.G.S.

FAR away in the heart of Asia, on the western confines of the Chinese Empire, lies a range of mighty mountains dividing Kashgaria from the Ili Valley and Northern Turkestan. The Thian Shan, the range in question, is a grand chain of mountains stretching east and west, and running far into Russian Central Asia. From its sporting aspect it may be regarded as a great hunting-ground in general; but, as is usual with all good things, it is difficult of access. To the traveller journeying thither from India many obstacles are presented. He must cross the mighty ranges of the Himalayas and the Hindu Kush, and must march over the Pamirs, that region of awe-inspiring immensity fitly termed the Roof of the World. At the summit of the pass which crosses the watershed of the Hindu Kush he reaches the point where three empires meet, the parting of the ways where one leaves the confines of civilisation and enters the strange and weird dominions of the Flowery Kingdom. To the north-west lies the centre of political gravity of the Asiatic continent, a centre the position of which has undergone many changes since the Northern Colossus first set forth on her irresistible march across the Turkestan steppes. The subject of Central Asia is an all-absorbing one, and the movements in the valley of the Oxus are watched with never-failing interest. For years Russia has steadily pushed forward her outposts, until at last she is within a stone's-throw of the gates of Herat, the fate of which is fraught with such momentous consequences. By successive stages she has absorbed the territories lying between her and the goal of her ambition—the Afghan frontier; and now she is in a position to become a dominating factor, and one with which we shall assuredly have to reckon in the near future.

Journeying onward, ever onward, the traveller descends to the plains of Chinese Turkestan, the land of old Tartary, whose ancient associations have invested it with a halo of romance, and have, more particularly in recent years, given rise to questions of deep political import. For upwards of a thousand miles the trek must be continued across deserts whose confines reach almost to the shores of the Yellow Sea. Here and there he will encounter groups of mud-built houses, surrounded by scanty clumps of withered trees which look forlorn and out of place amidst the general air of desolation, the oases in this Central Asian Sahara. From the northern limits of the Tarim Desert he will obtain his first view of the mighty Thian Shan range, and after the long trek of many hundreds of miles a glad sight it is indeed, this view of the Celestial Mountains, as the Chinese have picturesquely styled them, with their snow-clad peaks and shining glaciers, truly a scene of sublime grandeur comparable only to the panorama disclosed by the Rocky Mountains from the prairies of Alberta. Thus he reaches the goal; and, camped amidst the pine forests and grassy slopes, he forgets the toil and hardship, the stupendous ranges of mountains he has crossed, the rushing torrents he has successfully negotiated, all the perils and dangers attaching to such an undertaking, and longs only to come face to face with ibex in the rock-bound corries, and hear the wapiti stag calling in the dense forests which form so prominent a feature of this happy land.

Inhabiting this remote corner of Cathay are the Kalmuks, a race of nomads of Mongolian origin, who, although they have come under Chinese influence, have preserved their own language, as also their national customs and traditions, many of which are remarkably interest-

ing. During the eighteenth century they were settled on the Volga under Russian jurisdiction; but, becoming dissatisfied with their lot, they determined on a flight eastward across the boundless steppes of Asia to some land where they might find a haven of refuge. Accordingly, in 1771 took place the migration of all the Kalmuks to Dzungaria and the Thian Shan districts of the Chinese Empire, a trek immortalised by De Quincey in his *Flight of a Tartar Tribe*. This celebrated journey, surpassing that of the great Boer trek from Cape Colony in 1836 to the country north of the Orange and Vaal Rivers, occupied a period of eight months; and, though at the outset they were half-a-million strong, scarce one-tenth survived to reach the final haven. From the shores of the Volga to the grassy slopes of the Thian Shan Mountains they had battled on with a constancy that has no equal in the history of the world. The relentless Cossack, the wild and untutored Kirghiz of the Central Asian steppes, the rigours of the Siberian winter, hunger, fatigue, and disease, all had been overcome, and at last the promised land was reached. There, amidst the Heavenly Mountains, the Kalmuks hoped to find a permanent place of settlement and found an independent kingdom. In this, however, they were disappointed, for the Chinese had but recently taken over the country; so but two alternatives presented themselves: either they must become subject to China or be turned back on to the Cossacks and Kirghiz who were hard upon their trail. They chose the former, and were accordingly permitted to settle in the Thian Shan, where ample pasturage was available for their herds of cattle and horses.

These Kalmuks within the boundaries of the Chinese Empire pay an annual tribute in kind to the authorities, and also furnish the mounted levies established along the border and in the western part of the Tekkes Valley, which here forms the principal valley of the mountains. For purposes of administration, the tribe is divided into sections presided over by officials who are responsible for judicial and military affairs in connection therewith, the higher grades being nominated from New Kulja, the headquarters of the Chinese Viceroy, who is the supreme head of all the Kalmuk tribesmen, and his authority is absolute in all matters connected with questions arising with the suzerain power.

In religion the Kalmuks are Buddhists, and their hair is worn in pigtails, like the Chinese. The type of feature is distinctly Mongolian, with almond-shaped eyes and prominent cheek-bones. In stature they are above the middle height, and a fine-looking race, ever cheery, and excellent hunters and cragsmen. Whenever possible, they prefer to be mounted, but are none the less able and willing to walk when engaged in hunting, as their footgear is well adapted to the purpose, and their attributes as hillmen are of a high order. When not hunting, the Kalmuk always

rides; and should a horse not be available, he is equally at home astride the lumbering ox.

As in the case of the Tibetans, the Kalmuks pay but scant attention to the old adage that cleanliness is next to godliness. Nevertheless they are a fascinating race of people, appealing strongly to an Englishman for their love of the chase and their sporting instincts.

The manners and customs of the Kalmuks are in many respects remarkable, more particularly in regard to the disposal of the dead. Instead of burial in the orthodox manner, the body is put out on a knoll or low hill in the vicinity of the camp, and there left to the tender mercies of dogs and birds of prey. Should the remains not be disposed of within the space of a few days, the departed is deemed to have led a wicked and wayward life, a presumption that is visited upon the relatives in the shape of a severe chastisement all round; the sins of the father visited upon the children indeed!

Marriage plays an important part in the life of the Kalmuk, betrothals being arranged early in life, and but scant regard paid to the wishes of the lady. A wedding is a great event, the bride being usually carried off by force by the suitor, to which arbitrary procedure the parents offer no objection. Here it is a case of being wooed and won on horseback; and should there be several aspirants for the lady's hand a strenuous chase ensues, albeit she generally contrives to fall into the grasp of the swain whom she regards with the greatest favour.

The Kalmuk dwelling is the *aul*, a warm and comfortable habitation, constructed of felt on a circular wooden framework, having at the top an opening to let out smoke from the fire lighted in the interior. Upon the floor are spread *numdahs* and rugs, and in the case of the wealthier Kalmuks the *aul* is adorned with embroidered cloths and coverings, imparting a pleasing and artistic effect. When moving to fresh pastures, if the distance to be compassed is short, the *aul* is carried bodily by men and women, but for a longer journey it is dismantled.

The food of the Kalmuks comprises milk, mutton, and horseflesh, the last-named esteemed a great delicacy. However, the most popular article of diet among them is *kumis*, or the fermented milk of mares, the taste of which must certainly be an acquired one. The writer has sampled a number of beverages during wanderings on five continents, but has yet to encounter anything rivalling *kumis*. The drink in question is made in a leathern receptacle, and frequently shaken until fermentation supervenes, when it is considered fit to drink. Whenever a halt is made at an *aul*, or a visitor arrives, he is proffered the flowing bowl, and does full justice to it. There is no accounting for taste even in Central Asia.

The chief of the Kalmuks—or khan, as he is called—is an important personage in this

remote corner of China, and the liege lord of all his nomad subjects. His camp lies in the Great Yulduz Valley of the Thian Shan, a valley famed for the grass and pasturage it affords to countless herds of horses and cattle of the Kalmuks, who migrate thither for the summer. Its length is about thirty miles, with an average breadth of twenty, and it is rich in grass of a height of ten or twelve inches.

Many days' hard marching had brought me from the plains of Chinese Turkestan to the smiling valleys of the Thian Shan; and, having heard much of the Kalmuks and their khan, I determined to visit the latter in person. On reaching the northern slopes of the range I had pitched camp hard by a group of *auls*, and there interviewed an intelligent Kalmuk. From him I learnt that their chief lived a great way off; but his ideas as to the exact distance were somewhat vague, it apparently being anything from five to fifty miles. He, however, volunteered to accompany me to the camp of the khan, so I decided to start at dawn the next morning. Fresh horses had been secured, and we set forth at daybreak, riding across the plain in an eastern direction. Throughout the day we pushed on, the hardy Kalmuk horses seeming to be incapable of fatigue, and at six in the evening reached a Kalmuk *aul* by the banks of a river, where we commandeered fresh horses, and then pushed on harder than ever. By eight o'clock night had fallen with that rapidity common to the East, where twilight is unknown, and soon after we had to ford a wide and deep river three times, which, on tired horses and in black darkness, is a hazardous task. Only by the greatest exertions could our steeds maintain their footing in the swirling waters, which sped on with alarming velocity. The current was well above the saddle-flaps and rushing like a mill-race. Crossing at right angles was impossible owing to its depth and force, so we were carried some way down-stream before finally securing a foothold on the opposite bank. The Kalmuk horses behaved well, displaying that admirable coolness so characteristic of them. At such a critical moment they remained undismayed, breasting the current always with their heads in the right direction. When lifted completely off their feet by the rush of water there would be but a quiet struggle and a gradual edging toward the bank.

Beyond the third ford we encountered a long file of camels laden with tea and other articles, going down, like the caravans of Biblical renown, to barter amongst the Kalmuks for skins and felt. They told us the khan's camp was still far off, and that there were at least five hundred *auls* there. Towards ten o'clock we reached some more *auls*, and here the Kalmuk guide wished to halt for the night. However, I insisted on proceeding; so we rode on through the valley, though I mentally wished the khan

somewhere, being weary of the long ride and the search for his apparently phantom dwelling-place, seemingly farther off than ever. At last, when, already past midnight, we debouched from a narrow neck in the hills on to a wide, open valley, a short ride of less than half a mile brought us to the first of the *auls* of this strange people. The hour of our arrival was somewhat inopportune, for the entire camp was wrapped in slumber, the only person I discovered who was not in a somnolent condition being a drunken Kalmuk, who hiccupped in the orthodox fashion, and was consequently of little avail. I rode round the camp with a view to discovering some one in authority, but finally had to abandon the attempt. With us came a host of dogs who made desperate efforts to bring us to bay, and it was only by the most strenuous exertions that we were enabled to secure refuge in an *aul*, which the dogs promptly surrounded, making enough din to subdue a brass band of the most strident proportions. In the end the canine fiends yielded to the inevitable, and gradually dispersed, leaving us to sleep, and to reflect on what an arduous undertaking it is to carve one's way through the wilds of Central Asia.

When I awoke at daylight, after an uncomfortable night, there were two large twelve-pointer wapiti heads hanging up in the *aul*, having been brought in from the Jirgalan Valley, some marches to the westward. The Asiatic wapiti (*Cervus canadensis songaricus*) is one of the finest representatives of the deer family, and his antlers constitute a magnificent trophy. Amongst the Chinese the horns possess a medicinal value when in the unformed state, being ground into powder and used for the cure of certain complaints; though whether any benefit results therefrom is open to doubt. The Chinese pay large sums for a good pair of antlers, the price varying from fifty to one hundred and twenty roubles in Russian money. Such is the incentive to the persecution of this noble stag that as many as twenty-four have been bagged by one hunter in a single month. Certain it is the day is not far distant when the Asiatic wapiti, even now all too rare, will have passed for ever from the forests of the Thian Shan, in the same manner as the bison, once found in countless herds, has disappeared from the prairies of North America.

I sallied forth from the *aul*, and beheld the camp of the khan, to interview whom I had come so far and endured so much. This was his home, surrounded by the *auls* of his Kalmuk subjects, the people with whom one comes most in contact when travelling in the Thian Shan. The Wazir, or Minister of the khan, now arrived, and received me hospitably, apologising for the unofficial reception, due to his being unaware of my visit. A spacious *aul* was then placed at my disposal, in which breakfast in the Kalmuk style was served. This consisted of strips of

mutton fried in fat, reminding one of the biltong of South Africa, with some excellent little cakes of flour, a rare delicacy, and procurable only from the far-distant fields of China.

The number of *auls* in the camp exceeded three hundred. Those of the khan and his suite were situated within a large square formed by other *auls*, several of the royal dwellings being as large as marquees. The material used in their construction was of the best quality, profusely adorned with strips of red felt, imparting a truly regal air to their otherwise sombre mien. In and about the khan's *auls* were upwards of fifty large black dogs of the collie type, each with a scarlet collar, a bodyguard of a ferocious kind, some of whom were doubtless the noisy friends who had greeted our arrival the previous night.

After breakfast I proceeded to prepare myself for the visit to the durbar hall, and to make acquaintance with the chief of this remarkable clan. With me came the Wazir and two of my followers, and preceding me marched a retainer of the khan, bearing aloft my Chinese visiting-card, a long strip of red paper having my rank and name thereon in Chinese characters, or as near as the Celestial writer could get to it. I was received at the entrance to the royal apartments, and ushered into the durbar hall, which was spread with magnificent carpets and rugs of Chinese and Bokharan make. The young chief, who was some twenty-four years of age, was much interested in my expedition from India, and asked many questions concerning Tibet, towards which, as Buddhists, the Kalmuks turn a reverential eye. He inquired as to how many days' journey it would be to England if one went on horseback, a question that was somewhat of a poser, but to which I replied by the assertion that it would occupy at least one hundred. This astonished him considerably, and I therefore followed it up by assuring him that it would take much less if one went by sledge and rail; but unfortunately his knowledge of the iron horse was *nil*, so this did not convey much. In response to further questions concerning my wealth and worldly position, he expressed great surprise on hearing I possessed no sheep or cattle, and failed to comprehend how I could possibly exist in this world without a strong contingent of lambs and kine. My explanations on the subject being obviously considered unsatisfactory, I refrained from further comment; but the future traveller to the land of the Kalmuks will do well to pose as a shepherd and owner of stock on a large scale if he wishes to be numbered amongst the high and mighty.

At the close of the reception I returned to my *aul*, and there held a levee, at which most of the Kalmuks in the camp were present, as the news of our arrival had caused great excitement and curiosity. They were especially

enamoured of my rifles and shot-gun, examining the barrels, and expressing unfeigned admiration at the polished surfaces. Some of the more wealthy were anxious to become the possessors of such weapons, one offering two of his best horses for either of the three, whilst another made overtures on different lines, but all to no purpose. Whilst my reception was proceeding two scouts arrived from the Jirgalan Valley, some distance to the west, with a report that a large number of Kalmuk horses had been stolen by predatory bands; whereupon the Wazir and the elders retired to discuss the matter and issue orders, returning shortly afterwards to renew their acquaintance with modern weapons and the wonders of expanding bullets.

The religion of the Kalmuks is Lamaism or Buddhism, and the clergy, or lamas, constitute an important element in the population. It is not within the province of this article to discuss the rise of Buddhism, but reference may well be made to its leading features. The advent of Buddha, who believed himself to be invested with a divine mission, occurred five centuries before the birth of Christ. This culminated in the promulgation of the religion, which spread through a large part of the Asiatic continent. The fundamental principle of Buddhism is contemplation, and amongst its precepts was the ordaining of celibacy, which caused the establishment of monastic orders composed of both monks and nuns. In the days of their inception these institutions were the seats of learning and religion; but in course of time their influence exerted an adverse effect upon the people, and the tyranny of the priests and inequality of castes—to overcome which Buddha had striven—became re-established. The spiritual and temporal head of Lamaism is found in the person of the Grand Lama of Lhasa, in Tibet, the centre of Buddhism, which until the recent British expedition there had for years remained a sealed book to the outer world.

Of the different animals to be found in the pine-forests and amidst the rocky gorges of the Thian Shan the Kalmuks have many strange beliefs. They tell you that the fox is of a black colour for five hundred years, after which he changes to white for a similar period. At the close of a thousand years, having wearied of life and whiteness in that time, he gladly dies. Regarding the fir and pine trees, the Kalmuks say that they stand for a thousand years, after which they drop to earth and lie another thousand years until they rot. Again, the Kalmuks hold that the wapiti stag lives for five centuries, always provided nothing untoward happens, at the end of which time it presumably quits this mortal life well stricken in years.

In connection with the khan a curious story is prevalent. On attaining the age of twenty-five years he vanishes from this world, and a new khan reigns in his stead. The mode of his

disappearance from mortal ken rests somewhat in obscurity, but apparently the end is brought about by means of poison. A recent khan, whose views on the subject differed considerably from those of the high priests and elders, not being desirous of qualifying for an early death, had fled from the cares of state on nearing the

fatal age; in which he showed a commendable amount of wisdom and circumspection, for not even the prospect of perpetual bliss in the society of other defunct khans could tempt him to give up the ghost. Of a truth, uneasy lies the head that wears a crown in the land of the Kalmuks.

THE HEIR TO SUNNINGHALL

CHAPTER II.

GREGORY very soon found his way down-stairs, a winding open staircase leading to the square stone-flagged hall, with its few old rugs and ancient oak furnishing, out of which numerous doors opened, leading he knew not whither. He opened one by chance, an oak-lined dining-room with an oval gate-legged table spread with a white cloth, and with the adornments of glass, silver, and flowers. Four places were laid. He shut this door and opened another. This was, he concluded, the drawing-room, an apartment to the use of which he had been a stranger for many a year. It was furnished, as in the days of his great-grandparents, in yellow satin, with dark rosewood tables and cabinets holding a choice display of blue china; the walls were white, the carpet a dark dull blue, costly in its day, but a good deal worn. With masculine want of observation, Gregory failed to notice detail; but the whole room gave him an impression of other days, of stiff propriety, of feminine overnice orderliness; it suggested, somehow, his aunt's small, well-finished person.

On the sofa under the long windows draped with yellow curtains a woman dressed in transparent black was sitting reading. She looked up quickly and flushed; somehow she gave him an impression of shyness almost unfriendly, almost amounting to dread. She kept her finger in her book, and after the first brief glance turned her eyes downwards. She looked, he thought, handsome; the full white column of throat set on the firm satin-smooth neck, revealed by her half-decolleté dress, was surprisingly fine. She puzzled, and therefore attracted, him. Frank, confiding, trustful to a fault, as he was, reserve and self-restraint had the charm which opposites possess. He sat down by her and spoke as if they had been friends for years rather than acquaintances of a few hours.

'Well, Miss Emerson, am I early, or are the others late? If I get a few minutes with you alone I'll use them to ask questions.'

She drew imperceptibly away, and again the slight flush stained the creamy pallor of her face. 'Questions, Mr Le Fevre?'

'Well, why not?' he said gaily. 'I'll answer any of yours if you care to ask 'em. Here am I planted a stranger in the home of my ancestors,

and I want to know everything and everybody. Won't you gratify my natural curiosity?'

'What do you want to know?'

Her voice was like her eyes, he thought, sad and repressed, as if she dreaded to let loose some fear behind. He felt certain she must have known sorrow, perhaps tragedy, before coming under the kindly sway of his little aunt.

'Well, Miss Emerson,' he said gently and kindly, 'I'd like to know something of *you*, if you don't mind.'

'Of me!' She smiled, and a gleam of youth and lightness came into her face. 'Why, I've nothing to tell. I'm not at all interesting. My story is no story, or that of hundreds of girls. I hadn't a happy home. I was brought up in narrow circumstances; my mother took "paying guests" in London after my father died, and I drudged. Then Mrs Guthrie, who was a distant cousin, met us by chance, and came to stay at our house. While she was there my mother died, and Mrs Guthrie very kindly took me to live with her. That's all—here I am.'

'Here you are. I'm glad of it! Aunt Lyddy's adopted daughter.'

'No,' she said rather quickly, 'I don't pretend to be that. I am her useful companion; but perhaps I ought not to say I am useful. I have not very much to do. I arrange flowers, take things to the poor people'—

'I expect Aunt Lyddy's awfully good to them. I like that side of English country life, though the philosophers decry it. I've been so out of it all that it appeals to me. Aunt Lyddy's very kind.'

'Yes, she is very kind to the people about here. They all know and like her. Dr Guthrie attends them, too, for nothing.'

'Dr Guthrie! I didn't know he was that.'

'Oh yes, he has a degree; but he gave up practice years ago, except, as I said, amongst the poor for nothing. But he is a bacteriologist, an analyst. He has his laboratory at the end of the side wing.'

'I see. So the good old folks have lived a useful, peaceful life—an idyll in this most idyllic spot. Where did Uncle Anthony come in?'

'Nowhere lately. He had a stroke five or six years ago, and was in his own room always with a nurse. He would see no one but that

nurse and a doctor from London. His mind, I suppose, was affected; he could not speak distinctly. I never saw him after the beginning of his illness.'

'When did you come to Sunninghall?'

'Nine years ago.'

'Was Uncle Anthony well then?'

'Yes. He was tolerably active, a very quiet, reserved old man, but kind.'

'I suppose Aunt Lydia was quite mistress of the house and of him?'

'Yes.'

'How she loves the place!—as she says, every stick and stone.'

'Yes, she does.'

'No wonder; she was born here, has lived nearly all her life in it. Miss Emerson, I hope she doesn't think my coming need make a difference.'

Margaret Emerson looked at him for the first time with a long, clear glance as if searching his mind. 'But it must make a difference, surely. It is yours.'

'Mine as far as that goes, but hers too. I'm not going to dispossess the dear old thing. I'm a rolling stone. I feel now as if I had suddenly come to a stop for the first time, but that mood may change. I may want to wander; but Aunt Lyddy shall stay. *She* is more than rooted; she is part of the old house.'

'You think you will stay here at present?'

'Oh yes, I shall stay. This is home; if only my old dad were alive with me I should say more of a home than I have ever known. Sunninghall is a place to love.'

'Yes, Greg dear, isn't it?' a gentle, light voice said at the open door, and his aunt came in dainty in black satin and jet. He got up gaily to meet her and place her in a chair.

'Why, Aunt Lyddy, what a Fairy Fine-Ears you are! I must mind what I say when you're within a mile. It's a good thing I was uttering harmless truths. This Sunninghall of yours is a lovable old place.'

'This Sunninghall of yours, dear Greg. My reign is over. I offer you my sceptre.'

'Rubbish, Aunt Lyddy! You're Queen Consort. I make all the honours over to you. Your possession is by right divine, mine only an accident.'

'But by your uncle's will, my boy!'

'Poor old man! I wonder if he knew what he was doing.' She shook her head, still smiling, but a little sadly. 'The lawyer said so. Perhaps poor Anthony was a little changed by his illness. It seemed to break old ties. Did you hear that he would not employ either of our old family friends, our good Dr Bastin and the lawyer he used to have, Mr Reynolds? But the gentlemen he did send for—physician and lawyer—were both clever, excellent men. I dare say Anthony thought he had reasons. Well, well, what does it all amount to? Only that you are the owner

of Sunninghall, Greg dear, and we are your guests.'

'I feel that that describes me better, Aunt Lyddy. I am a stranger in the land. You've got to see me through and make me know the ropes, if you can, as well as you do.'

She shook her head with gentle sadness. 'Ah, my dear, that's hardly possible. This is the only permanent home I have ever known. You have wandered far afield. Well, well, here comes Daniel, and Perks too, to say dinner is ready. Your arm, my boy.'

He offered it affectionately; Margaret and Dr Guthrie followed separately.

The meal was not elaborate, but well cooked, and Gregory had a hearty appetite. Dr Guthrie also made a good dinner, but his wife picked a morsel only, and Margaret ate little. To his surprise, Gregory found that the old man was quite a good talker on his own subjects, and when touching on modern science and recent discoveries he forgot his tiresome repetitions, and could be interesting; and he was anxious to hear about other countries, customs, and people. The conversation was chiefly between the two men. Mrs Guthrie seemed a little pensive, though always cordial and gentle, and Margaret was entirely silent.

They had a visitor as they sat over dessert. A small car stopped at the front-door, and a noisy, red-faced, jovial man ran up the steps into the hall, and sent his voice before him to the dining-room.

'May I come in, good people? I was just passing, and smelt your port wine.'

Dr Guthrie went to the door, threw it open, and genially welcomed the arrival.

'Come in—come in, Bastin! Glad to see you—glad to see you. Port wine? Yes, to be sure. Drink the health of the new-comer—of the new owner. Come in, old fellow—come in!'

Mrs Guthrie echoed her husband's greeting with equal kindness. 'Ah, Dr Bastin! just in time. Let me introduce my nephew—Gregory Le Fevre—Dr Bastin.'

There was a little bustle of handshaking and talking, Margaret alone remaining passive, and beyond just a silent bow taking no part in the welcome. Gregory somehow seized on the idea that this noisy, red-faced, jocular man was not a favourite of hers. He had not been agreeable to his uncle Anthony, as his aunt had told him, and he was inclined, though it was early in the day, to agree with both. But Dr and Mrs Guthrie evidently liked and welcomed him, and so perhaps they were in the right. There might be something sterling behind the slightly vacuous laughter and loud, loose talk.

Dr Bastin was, as he often declared, an 'old-fashioned medico.' 'I don't condemn every good thing in life. I don't undervalue a glass of port like this. It's the fad of the day, I know; but I'd ask you, Mr Le Fevre, is the present

generation any healthier than the former? Did our fathers suffer from all the *itises* of to-day, or all the *neus*—neurasthenia, neurosis? Bless my soul, we called 'em hysterical bosh; and so they are! Well, sir, you don't look like a subject for any *itis* or the rest of it! 'Pon my life, you're the very picture of health. Is that what South America does for one? If so, we'd better all make tracks there.'

After a while Gregory began to get bored. They had sat longer over dinner than he cared for; the pensive summer twilight invited him. With something of colonial brusquerie he rose. 'If you'll excuse me, Aunt Lyddy, I'll take a stroll on the terrace and a smoke.'

Margaret Emerson had slipped away. His aunt rose quickly. 'To be sure, dear Greg, we were forgetting. You were to go round the house after dinner; but we've been talking and laughing, and it's late. Shall we put it off till to-morrow? You'd rather go outside?'

'I think I would, aunt, if you don't mind.'

'Mind, dear?' she said softly. 'You're forgetting again. You're the one to decide here.'

As he went out and lighted his pipe he said to himself, 'I wish the old dear wouldn't keep insisting on my mastership. Somehow I think it hurts her; and I wouldn't willingly do that.'

The long, dim terrace was fragrant with night scents of stock, of tobacco-plant, of sweet-brier; he drew them in with deep breaths of pleasure, letting his pipe go cold. Why intrude that coarse odour on the intoxicating perfume of the summer night? He leant on the mossy balustrade in a mood of calm repose. In all his strenuous young manhood he had known but little of that. He was at last aware of a light footfall on the gravel and the rustle of a dress. He saw the tall figure of Margaret Emerson approaching slowly. The bush behind him and the growing dark concealed him, and when she was close upon him she started violently. 'Mr Le Fevre! I thought I heard your voice in the dining-room?'

'Well,' he said in his frank, genial way, 'so you're sorry you're not alone—eh?'

'Oh,' she said with a more open tone than she had used before, 'I get quite enough of my own company; it isn't very amusing.'

'Then sit down here and let us renew our talk. I say, how sweet this English country smells! Your rain does something for you for all the abuse it gets. And shall I hear a nightingale?'

'No,' she answered, smiling. 'They have done singing. You must learn to know England and country life if you have come to stay.'

'There's heaps I want to learn. I'm a rough colonial, not used to gentle people and gentle ways. I shall often offend. I don't know in the least how to dissemble.'

'Don't learn,' she said almost passionately. 'If it is colonial to be straight, keep colonial.'

'My dear Miss Emerson, it ain't only colonial to be straight. Why—all of you—why, I'd trust you with anything.'

'Me? You trust me?'

'I should say so; of course I do.'

'You know nothing at all of me. We met only to-day.'

'It never takes me more than a few hours to decide about people, either to like or hate 'em.'

'I hope,' she said—and there was a faint smile on her lips it was too dark for him to see—'I hope you don't hate me—yet.'

'No fear,' he answered heartily, and with perfect simplicity he clapped his hand on hers. 'We're going to be pals. That's to say, if you've no objection—if you don't "hate" me.'

She said nothing, but she did not withdraw her hand from under his.

He forced her to speak. 'Come, is it a bargain? Shall we be pals?'

'If—if you care. But I must tell you I am an unfriendly, unsociable person. I have no "pals."'

'Then it's time you began. But of course I know you don't mean that. You have good friends—Aunt Lyddy, for instance. I expect you mean you have not been in the way, perhaps, of meeting people of your own age. Is that it?'

'Yes, that is it. I have not.'

'The sort we call "pals"?''

'I don't really know any one—I mean, that is to say, no more than on calling terms, and very few even then. This is a small social neighbourhood.'

'Has the doctor in there got a wife?'

'No.'

'That's the man old Uncle Anthony didn't like?'

'Yes.'

'Well, d'ye know, I'm inclined to think Uncle Anthony hadn't bad taste. What do you say?'

'I?' She hesitated, then gave a half-laugh. 'I'm so used to keeping my opinions to myself that it seems odd to be asked such cut-and-thrust questions. What does it matter what I think about Dr Bastin?'

'Miss Emerson,' he said quite gravely, 'I do feel, somehow, that your opinions matter. And I know you have strong ones, which you keep to yourself.'

'If I keep them to myself, how do you know I have them?'

'By your eyes. They watch and observe and judge. When we were introduced you just looked me through, and I said to myself, "If I were a wrong un I'd not like that girl to scrutinise me."'

'So you think I judged you at once?'

'Yes, I'm sure. Now I wish you'd just be quite open with me, and say if you found out anything that made it impossible to like me.'

'You really care to know?' Her quiet voice shook a little.

'I really do.'

'Then I'll tell you. No, Mr Le Fevre, I did not. I said to myself, "This is a man in whom there is no guile."'

'I'm jolly glad,' he said simply. 'Shake hands. We're going to be friends. Ratify that bargain.'

She gave him her hand, a firm, rather cold, long-fingered hand, and he pressed it with a strong grip.

'You'll put me up to English ways? You'll tell me things?'

'I'll do—what I can,' she answered under her breath.

'You never answered my question about the doctor in there. Come now, if you were ill, would you like to have him round?'

'I'm never ill.'

'That's begging the question. Would you?'

Again the half-embarrassed laugh. 'Mr Le Fevre, how persistent you are! I don't know. Perhaps not; perhaps I think he likes whisky and port wine just a little too much.'

'And he doesn't strike me as a brilliant light, anyway. Yet the old folks like him?'

'Yes.'

'And Uncle Guthrie's a clever scientific man.'

'Yes, he is.'

'Well, maybe, then, there's something more than appears in the fellow. Still—only, as you say, I'm never ill—I think I'd rather have some one else. Well, that's not likely to happen. I say, how pretty it is to see how those two old people look at each other! Their eyes are always meeting. People without children grow fonder of each other, I suppose. Uncle G. is a bit gruff, but any one can see he's devoted to Aunt Lyddy, and she to him.'

'Yes, I believe they are.'

'Then Uncle Anthony must have been a bit out of it. But dear old auntie would be sweet

to him. Didn't some one say his last illness altered him, and he took a dislike to her.'

'I believe he did. I was away part of the time. I had to go to an old relation of mine who died. But of course something must have changed him. He left her Sunninghall at first, you know.'

'Upon my life, I'd forgotten! The poor old lady! It must have been a blow, for she adores the place. Yet she's been so jolly kind to me! I think I'd better make my will and leave it to her—in case I'm smashed in my new motor.'

'Are you going to have a motor?'

'Yes. I've ordered one, and it's coming next week with a man to teach me to drive.'

'So you really mean to live here—to settle down?'

'Why, of course! Where should I live? Don't you want me? Your voice sounds as if you didn't.'

'Oh, I do,' she said hastily. 'Of course I do. But it seems so small. It must seem so to you, used to a much larger world.'

'It's large enough for me, at present. Oh, I dare say I'll get a little bit restless, and wander, but not till I've sucked all the honey out of this pleasant place, this peaceful, jolly life.'

She got up and put her scarf round her. 'I must go in. They're in the drawing-room, I see, and they may want me to sing.'

'You sing? That's good. I'm very fond of it. I've got a bit of a voice, but I've had no training. You must give me some lessons. Now I'll bet you sing contralto.'

She nodded. 'You'd win the bet.'

'Come along in, then, and let me hear you. I'll follow you in a sec. I must finish my pipe.'

Before that was done he heard Margaret's voice raised, deep and sad, and the rich notes drew him in. He had thought her eyes mournful, but all the sorrow of the world seemed hidden in her singing voice.

(Continued on page 378.)

GUN-RUNNING IN THE GULF.

By ROBERT MACHRAY.

JUST as the paradox of a certain famous chapter on 'Snakes in Iceland' is that there are no snakes in Iceland, so it might be said that the point of this paper is that there is no gun-running in the Gulf. But there is a difference. Although it may be stated that snakes were never found in Iceland, it is only of the year of grace 1914 that it can be asserted that gun-running had ceased in the Gulf, for during the past thirty years there has been enough and to spare, in spite of the most determined efforts to put it down, especially latterly, by Great Britain, the principal sufferer

as regarded India. Every reader of British journals had become familiar with lengthy paragraphs and even columns on gun-running, or some similar heading, and knew that the Gulf in question was the Persian Gulf, and that the gun-running referred to was the illegitimate importation of arms and ammunition into its ports.

This traffic was in active existence early in the 'eighties, but was regarded as of small importance from the political or military point of view; in the 'nineties it attained large proportions, which, however, still excited compara-

tively little remark or apprehension among the Indian Government officials; but the opening decade of this century saw the traffic expand so much more, and particularly in one direction, that at last its dangerous character as a real menace to India was clearly apparent, and repeated attempts, both by force and by diplomacy, were made to suppress it. Up to 1906 the gun-running 'industry' was mainly in British hands, and it is not nice to think that this was the case, considering what it means; but the British trade was checked, and for the last six or seven years the chief promoters of the business have been Frenchmen or Belgians working under the protection of the French flag, notwithstanding official British protests to France. At length, in February three years ago, an agreement was concluded between Britain and our neighbours across the Channel, the effect of which is to render it impossible for the traffic to continue. As practically there were no others engaged in the trade, gun-running in the Gulf has come to an end. The trouble is that the end comes too late, and the result may be the reaping of many a red harvest on the north-west frontier of India, in Afghanistan, and elsewhere in Asia.

Trading in firearms is in itself as legitimate a form of commercial enterprise as any other; but gun-running, which may be termed its illicit side, in the Gulf—and in other parts of the world, as will be noted later—has already wrought a good deal of mischief, and is sure to lead to an immense amount of evil in future. It has been customary to invest smuggling with an atmosphere of vivid romance and daring adventure, and gun-running has been no exception to the rule. Purveying rifles and cartridges, guns, and shot and shell to peoples rightly struggling to be free has evidently an interest that rises far above the ordinary gray levels of life; in such cases men run the risk of long imprisonment, torture, and even death itself, and their story must always have its appeal. It is small wonder, then, that the novelist should seize the opportunities thus afforded; there is at least one stirring tale that takes gun-running as its *motif*, and does it so unashamedly that it calls itself *The Gun-Runner*. Yet, generally, the truth is that gun-running, though it always connotes the illegal, has had, and still has, very little real romance about it, being for the most part a sordid business, usually drawing its inspiration from nothing higher than the greed for gain. There were enormous profits in the traffic, and these are still amassed where it continues to exist in any appreciable measure.

At the start of the traffic, which may be put about 1883, Bushire was the chief centre of gun-running in the Gulf; and then, as for some time afterwards, the trade had little or nothing to do with India. In those days rifles and ammunition were sold to go into Persia and

Arabia—in the one case to arm the Bakhtiari and other tribesmen, and turn the country, at any rate in the south, into one vast scene of ruin and desolation; in the other, to equip the Arabs against the Turks, and give tremendous vitality and eventual success to their revolts in the Yemen and in Asir. Later Muscat (or Mascat, as the word is sometimes spelled) became the principal entrepôt of the traffic. This city is the capital of Oman, an independent state of south-eastern Arabia, but virtually a British protectorate, as its sultans have for a considerable period been in close political relations with Great Britain through the Indian Government, which pays them a pension and has an agent stationed in the town. But in 1844, when Oman was genuinely independent, it made a treaty with France, granting that country the widest commercial privileges, and it was under cover of this treaty that gun-running went on apace during the last few years. As the sultans levied a heavy tax on the arms and ammunition imported, they were none too anxious, it may be imagined, to see the business brought to a close.

Formerly Oman was much more important than it is now. Not only was its territory in Arabia larger, but its rule reached over a long stretch of the coast of Africa, and included Zanzibar. The African portion of it broke away, and was formed into a separate sultanate in 1853, and wars in Arabia reduced its area there. Nowadays the state consists, to all intents and purposes, solely of Muscat and the strip of sand lying along the shore in its immediate vicinity. Over the rest of what is indicated on maps as Oman the sultan's power is merely nominal; it is a No Man's Land, almost entirely shut out from the coast by the barrier of mountains which rises behind the city. For something like twenty years Muscat, one of the few possible harbours on the Gulf—though, properly speaking, the gulf on which it is situated is that of Oman, the body of water at the entrance to the Persian Gulf—was the headquarters of the gun-runners, who succeeded in one way or another in effecting the distribution of their wares in the interior, or, what was easier, sent them by sea to the neighbouring beaches, and, what was still better from their point of view, to the district of Mekran (or Makran), partly in Persia and partly in Beluchistan, on the opposite side.

But at Muscat, as at Bushire, the traders in arms at the beginning chiefly supplied Persia and the regions at the head of the Gulf, as well as those on its southern shores. Great Britain did something toward stopping them; thus, in 1891, it ordered the sultan of Oman to forbid the importation of the weapons into Gwadar and its dependencies; and in the following year it laid the same compulsion on the chiefs of the pirate coast, with whom it had treaties. The traffic, however, went on; but it was not till

1897, the year of the great revolt in Tirah, that it began to assume really formidable dimensions, the expansion being caused by the fact that an extensive and extremely lucrative market had been discovered among the warlike races of the north-west frontier of India, who were eager to exchange their inefficient home-made jezails for the superior rifles and cartridges supplied by the gun-runners from Muscat. It is true that the tribesmen on the frontier had had some rifles before that date; these they had procured in not a few instances by the simple process of stabbing a lonely sepoy sentry and making off with his weapon, or they had obtained them in a less deadly fashion from Indian merchants by means of various ingenious devices, such as strapping them under wagons ostensibly carrying quite innocent goods, or hiding them in bales, barrels, and even coffins. But all these methods of rifle-getting had their risks; and the Pathans, Afridis, and other clansmen of the border quickly discarded them on learning that they could purchase immense quantities of the arms they coveted, with plenty of ammunition—a very important consideration—by sending caravans to the Mekran coast to meet dhows from Muscat. The native jezail-making factories went out of business, and their proprietors promptly invested their capital in this new and promising industry.

The frontier septs raised large amounts of money, and went on arming joyously. Having regard to their relatively small numbers, they spent really vast sums—as may be judged from the statement that the Adam Afridi Khels, a minor clan, lost as much as twenty-four thousand pounds in one gun-running season after the Indian Government had undertaken with all its might to bring the thing to an end. But at the outset, and indeed for ten or eleven years afterwards, the Government of India had no adequate conception of the gravity of the situation, though not altogether blind to it. The sultan of Oman was induced to give to British and Persian men-of-war the right of search in Muscat waters. H.M.S. *Lapwing* captured and confiscated two hundred and twenty cases of arms and ammunition found on board the Anglo-Persian Steam Navigation Company's vessel *Beluchistan*; the owners went to law, but the House of Lords upheld the action of the warship. One or two other British warships essayed to keep watch and ward over the Gulf, but on the whole met with indifferent success. In spite of them, the trade flourished; it could easily afford some losses, for, if no more than one dhow out of five got across to the Mekran coast and landed its cargo safely, the profit was so enormous that the venture abundantly recompensed the gun-runners; but the percentage that contrived to elude capture was much higher. In 1900 the British Government endeavoured to get France to consent to

the abrogation of her treaty with Oman so far as the importation of arms was concerned, but France declined; nor were British representations at the Hague attended with better results. The traffic went on increasing instead of diminishing, till Muscat was doing a trade in rifles valued at about a quarter of a million pounds sterling each year.

It was not until 1907 that the Indian Government began to be seriously alarmed, and to consider severe preventive measures. Authentic information as to the extent to which the tribes of the frontier were armed with these imported rifles had penetrated to it at last; and it was also greatly concerned to learn that large numbers of rifles, obtained from the same source, had been brought into Afghanistan, King Habibullah, the present Ameer, having more or less openly encouraged his people to purchase them—somewhat to his own cost, as he discovered later when his troops were cut up by some of his own subjects in the Khost valley. In *Gun-Running and the Indian North-West Frontier*, an interesting and well-informed book, published in 1911, from which some of the facts set forth in this article have been derived, its author, the Hon. Arnold Keppel, states that one big load of thirty thousand rifles was successfully run through to Kandahar, and says that it was suggested that these weapons had seen service in the hands of the soldiers of New Zealand and New South Wales in the South African war. And here it may be noted in passing that while most of the rifles sold from Muscat have been of inferior quality or of a former pattern, by no means a few were excellent up-to-date weapons, such as Mausers and Mannlichers; the gun-runners, further, furnished quantities of Mauser and Browning revolvers, and they invariably took care to supply suitable cartridges for whatever sort of implement they traded in.

Muscat imported eighty-five thousand rifles and twelve million cartridges in 1908-9. The Government of India made up its mind, and resolved on decided and strong action. In 1909 the East India squadron instituted a tremendously rigorous blockade off the Mekran coast; and during the winter of that year many dhows were captured, very few getting past. Admiral Slade headed an expedition into Persian Mekran, and broke up the gangs of the gun-runners who had assembled for the purpose of conveying the contraband to various points in the interior. Year after year the blockade was maintained with the utmost severity; it was already so effective even in 1910 that it was reported among the tribes of the north-west frontier that the ships of the Sirkar had made the traffic impossible, and hardly a caravan was sent down to the coast. This was before the French Government came into line. As a consequence, the frontier trade stopped; the clans lost a great deal of the money they had embarked in it,

some of them being ruined financially. But the mischief had been done. It is estimated that about two hundred thousand rifles are now in the possession of those fierce tribesmen, who are well able to use them with deadly effect, for they are naturally amongst the finest skirmishers in the world; therefore, when the Indian army has to attack them again it will be confronted with an extremely formidable task, and the tale of its losses is likely to be very heavy. Much the same may be postulated with regard to what will happen should it be called on to march against Afghanistan. The one good thing on the *per contra* side is that neither Afghan nor Afridi will find it easy to renew his stock of ammunition.

But while gun-running in the Gulf has ceased, the illicit traffic in arms continues elsewhere, as hinted above. For years it has been going on in Africa, where are now to be found hundreds of thousands of savages, 'clad in beads and bandoliers,' and with rifles in their hands. It is impossible not to be appalled by the terrible possibilities this statement suggests, for, when all is said and done, the savage who is equipped with rifle and bandolier, and fights in his own country, is a very 'tough proposition,' up against which the best white soldiers might probably come to grief. In this connection it is well to remember that, as a rule, Europeans have won, when warring with coloured races not only in Africa but in other parts of the globe, not so much by their greater mental or moral powers as by their sheer superiority in lethal weapons. The great centre of this branch of the traffic in arms has been Jibutil (Djibouti), the capital and chief port of French Somaliland, and the terminus of the railway which runs into Abyssinia. It is situated near the entrance to the Red Sea, and is about one hundred and fifty miles from Aden. Prior to 1888 the French had made Obok the principal port in their part of Somaliland, but in that year they selected Jibutil because it was a better harbour, and consequently Obok has declined. Stupendous quantities of rifles have been distributed from Jibutil throughout Eastern Africa—in Abyssinia, the Anglo-Egyptian Sudan, Uganda, the British East African Protectorate, and Somaliland itself, French, Italian, and British. Four years ago Japan sold, to go by Jibutil into Abyssinia, sixty thousand rifles and six million cartridges which they had taken at Port Arthur in the Russo-Japanese war. No long time afterwards it was stated by competent authorities that a million Gras rifles had been sold in Eastern Africa through Jibutil, and with these went the requisite ammunition.

It is an absolute and terrible truth that Jibutil has been the scene of gun-running on a vast scale. From time to time conferences have been held at Brussels by the Powers interested in those regions of Africa which were affected

by the trade, and measures were discussed and adopted for dealing with the evil. But in Africa, as in Asia, the mischief has been done, and the penalty will some day have to be paid. Granted that quite a considerable number of these rifles—such as the Gras rifles, the price of which was put as low as four or five shillings at Muscat—are distinctly of an inferior type to the best weapons of to-day used in European armies, the fact remains that rifles of a much better class, if still inferior to the best, have also found their way into the hands of the wild, barbarous, yet courageous native races of East Africa in far from negligible quantities; and those less efficiently armed will speedily understand, if they have not done so already, the differences in the make of rifles, and will strive to obtain possession of the superior article. The profits of the business being such as they are, it is certain that there will not be wanting men, cynically indifferent to consequences, who will be ready and eager to supply it. However, it must be stated that, with regard to the traffic through Jibutil, new regulations have recently been issued by the French Government, which it hopes will be effective in preventing arms going through illegitimately. The trouble comes in defining the illegitimate. But, apart from that, there is great need to arouse the conscience of all those concerned in the sorry business.

MY SILVER BIRCHES.

THEY are lovely in the summer, they are lovely
in the spring,
And in win' r-time may beauty still to leafless
branches cling;
But in autumn, golden autumn, then the artist
vainly searches
For a truer line of beauty than my row of silver
birches.

'Tis the finger of the autumn which, as in some
tale of old,
Clothes the lady of the woods in magic drapery of
gold,
Revealing when it seems to hide the branches'
tender grace,
As a veil may only half conceal the beauty of a
face.

Like the golden dreams of childhood, with the
future in their glance,
Which wrap what lies beyond in golden glory of
romance;
Like silver mists arising when the shadows longer
grow,
And blotting out the past which we no longer
care to know.

You may sit behind my birches and may never
know they hide
The pit-shaft and the slag-heap and all ugliness
beside.
Though the clumsy hand of man the handiwork of
God beasmirches,
In my garden you need never look beyond the
silver birches.

C. J. BODEN.

Chambers's Journal

SEVENTH SERIES

HISTORY FOR THE HOLIDAYS.

By F. G. AFLALO.

MACAULAY'S nephew and biographer was of opinion that the historian carried his ruling passion with him on his travels, and saw scenery only with the historic eye; and passages like that in which he describes the sympathy between rivers and the nations cradled on their banks—the affection of the Hebrews for the Jordan, of Hindus for the Ganges, of Egyptians for the Nile, of Romans for the Tiber, of Germans for the Rhine, and of Frenchmen for the Rhone—undeniably bear out Sir George Trevelyan in this view of his uncle's standpoint on the Grand Tour.

Herein, however, lies a suggestion for those who sometimes find it hard to get through their holiday without a sense of *ennui* that, though it recurs annually, they would not, during the working days of summer, have thought possible. For the golfer or the angler such prescription is superfluous, since his vacation is all too short, and the failure or success of each day merely whets his appetite for fresh effort on the next. For the invalid, or even for those who, broken down by overwork, ask nothing better than to lie on the foreshore and listen to the murmur of the sea or to rest amid beautiful scenes that contrast with the grim surroundings of their workaday life, such extraneous interest is also unnecessary, since the merest distraction is sufficient to their enjoyment.

The salt of every holiday should be complete change from the humdrum routine of the other eleven months. Peter the Great recognised this when, in the intervals of hard work in the shipyard, he liked nothing better than to drive in a wheelbarrow through Evelyn's hollyhedge at Sayes Court. This seems trivial amusement for a Czar of All the Russias; but the hero of Pultowa knew the true value of contrast, and no doubt the scratching of the holly proved an agreeable stimulus to his calculating brain. Those, therefore, who lack enthusiasm for any manner of outdoor game or field sport, who—there are such people—find themselves 'bored to tears' by the mute contemplation of grand scenery, who give no thanks for the birds or flowers or other bounties of nature, should try the magic of a holiday seen through the historic eye. To some extent, no doubt, its success will depend on their own

temperament. Unless they be informed with that *respect profond du passé* which, as Renan tells us, is characteristic of *les vrais hommes de progrès*, it is doubtful whether the monuments of dead generations, the battlefields, the scenes of treaties, the birthplaces and burial-places of the great, and all the other harvest of the historic eye will have any meaning for them. Yet even those whose trust is in the future, who look forward and care little for what has gone before, are the better for occasional retrospect. A moment's homage at the grave of Nelson is no less inspiring than the spectacle of Dreadnoughts arrayed at Spithead, and the memory of Wilberforce which invades the visitor to the otherwise unromantic port of Hull is a better reminder of the brotherhood of man than the lurid pages of *Uncle Tom's Cabin*.

As a matter of fact, the opportunities of the historic tourist in the southern half of Britain are very limited, for the last invasion by a hostile force was in the famous 'Forty-five,' and the last fleet of the enemy to come in sight of England's shores was when Napoleon's transports lay at Boulogne. A lively interest in the battlefields of the Roses, or in the scenes of the struggle between Cavalier and Roundhead, is more than most men can nowadays even pretend; though the more modern fights on Scottish soil have vivid memories for those who still live in the past. For the most part, however, Britain's modern history has been made on the high seas or in other lands. I have fished in Aboukir Bay and cruised off Cape Trafalgar, and my thoughts were with Nelson's fighting line rather than with the business of the moment. In the Low Countries and in the Peninsula my train has stopped at little wayside stations red-lettered in school history-books. On the citadel of Quebec and amid the dismantled fortifications of Louisbourg I have harked back to the long struggle for Canada between two great Powers now fighting shoulder to shoulder. Not in a twelvemonth of England may you find so many evidences of her making.

One aspect of this fancy may, however, be indulged more generously at home than elsewhere, since it is the fashion to bring home the dead for burial in the family vault or in the great fanes of London. The Mecca of the hero-worshipper

is Westminster Abbey; but there are tombs for the seeking up and down the length and breadth of the land. This, again, is temperamental. Though few would be utterly indifferent to the injunction of Condé, '*Sta viator; heroem calcas!*' there are many to whom only the soul mattered, and for whom the mortal remains have no inspiration. I confess that, though his book is a veritable gospel, the grave of gentle Izaak Walton attracts me so little that I have passed within a stone's-throw of it, yet never seen the spot. Walton was a minor light; a light, indeed, only to those who love his quiet book and share his enjoyment of a peaceful recreation. Few, however, could stand unmoved in presence of the tremendous ones of earth; and, unlike some other sheaves in the harvest of the historic eye, this pilgrimage to graves does not depend for its glamour on antiquity, and it is possible to feel a keener emotion as one stands uncovered beside that lone grave on the Matoppos than in presence of the vanished dust of William the Conqueror in the French cathedral.

The new lands are necessarily lacking in these mementoes of a troublous past. America, it is true, has her battlefields of the only two great wars—if we disregard the extermination of the Red Men—ever fought to a finish within her borders; but these have little interest for tourists from Europe, and I have even seen Americans more moved in presence of the willows of Grand Pré, their eyes wet with honest tears shed in memory of the purely imaginary Evangeline, with whose story Longfellow harrowed the feelings of his sentimental countrymen. Canada has likewise her monuments to mark the changing fortunes of French and British rule; but here interest is in the future, and the grain-elevator attracts more eyes than statues or obelisks.

In Britain the historic spots available to the holiday-maker in appreciative mood are chiefly ruined palaces or castles—Holyrood, Norham, Pevensey, Hastings—or personal shrines like Canterbury Cathedral or Stratford-on-Avon; unless, indeed, the traveller have a fancy for breathing the historic atmosphere in a rural setting, in which case he must content himself with tarrying in the shade of the oak that hid Charles Stewart, or of that even more accommodating tree from the branches of which Kett's followers dangled after the failure of his rising.

There is one land of Europe which is, above all others, generous in its opportunities for the historic eye, since the story is always old and ever new, its treasures are of all ages; and the tourist of broad sympathies, whose interest is not confined to any period, may wander haphazard from the great days of Rome to the dark memories of the Middle Ages, and out into the brighter light of Italy's last great struggle for freedom. As he lingers amid the classic ruins

of Rome his thoughts will revert to half-forgotten class-rooms, with dim figures in cap and gown hurrying through chilly cloisters. When his train sets him down at Arqua or Arezzo or San Gimignano he cannot but recall such snatches as he knows of Dante and of Petrarch, with memories of the sanguinary struggle between Guelph and Ghibelline, and of the crimes of the Borgias and the Medici; while in the more modern gallery of Turin he finds himself in the great presence of Victor Emmanuel and Cavour. Soldiers, statesmen, and poets all pass before him in ghostly array, playing their parts in the splendour of ancient Rome, in the long era of papal Italy, or in the last upheaval, in which, on the fields of Solferino and Magenta, a people sick to death of Austrian rule and internecine warfare won what it hungered for—'*vogliamo l'Italia una!*'

Yet older than Italy, hallowed at a time when Europe was overrun by painted savages, there is a land watered by the sacred Jordan to which, given the opportunity, the historic traveller should bend his steps, for there only may he find himself invaded by wonderful memories of the childhood of his creed. As a holiday programme unforgettable until he dies, let him stand beside the Sepulchre and recall all its history down to the turmoil of the Crusades which raged around the peace of it, let him pass beneath the low gateway of the Church at Bethlehem, let him wander along the slippery bank of the Jordan watching fair-haired pilgrims being baptised in its swift waters, let him ride past the crumbling walls of Damascus, and drift in a felucca on the blue waters of Galilee. If from the moment of landing in the orange-scented atmosphere of Jaffa he can easily resist the overwhelming inclination to take the shoes from off his feet, for the ground on which he stands is holy, then the historic holiday is not for him. Something of this tremendous awe of the dead past is to be felt in presence of the Colossi of Memnon and other relics of the Nile Valley, but to me at any rate their appeal was faint after that of the Holy of Holies. The historic eye sees with a faith that beautifies the commonplace. But for this happy illusion of the *respect du passé*, many of the scenes that are landmarks in history would give little pleasure to the beholder. Yet, as Emerson tells us, the difference between landscapes is less in themselves than in those who contemplate them. Therefore, instead of being filled with quiet disgust at sight of the environs of Jerusalem or of the suburbs of Rome, we uncover in reverence. Looking from the windows of the train between Jaffa and the Holy City, we see no horror in the vale where, as tradition has it, David slew Goliath, though a more dreary outlook could scarcely be pictured in any land. The Jordan is a dirty stream, and as treacherous as any in the world; yet to the Russian and Abyssinian pilgrims, who make the long and

tiring journey to wash their sinful bodies in its flood, its muddy banks doubtless have a rarer beauty than would the choicest prospect in the whole course of the castled Rhine.

Herein lies the true enjoyment of the historic eye. It gathers in its harvest in quiet rapture, but the delight of its garnering is beyond words.

THE BRIGHT EYES OF DANGER.

CHAPTER XXV.—I PUT MY 'VIRGIL' IN MY POCKET.

THE land lay clear as an etching after the rain when I rode back to Edinburgh. The stubble glowed in the sunlight. The rooks were wheeling and lurching in a light breeze that sent the branches tossing overhead, picked out against a clear sky that bent without a cloud down to the line of the horizon. More than once I drew rein for the sheer pleasure of letting my eye travel over the pleasant distances of the East Lothian countryside, Arthur's Seat (the smoke of the old city hovering near it), and the great girdle of the sea. The scene conjured up peace and contentment; but for me peace and content hung on one thought. One moment it would thrill me like music; in the next I would be plunged into a fever where doubt chased hope, and happy dreams dissolved into drab matters of fact almost as soon as they took shape, to give way to a tender melancholy, foreign to my blood, as I thought it, not knowing it to be the common heritage of lovers.

I knew that I loved Charlotte Macdonell. Since the first morning that I saw her I had compared all women with her. Her delicate beauty shone in my thoughts like a star. A constant desire to be beside her, a longing to see the pure outline of her face, above all to hear her voice, were wishes sweet and overmastering, part of my very being. All my actions were passed before the imaginary tribunal of her judgment, wherefore the knowledge that I had been of signal service to her and Bertrand, and had borne myself like a Layton, glowed in my veins like wine. One black disturbing thought hung like a steady cloud-bank over me—Charlotte was a Jacobite of the Jacobites, daughter of her clan, her eyes kindling at the Prince's name. I remembered the change in her bearing when she discovered, from almost the first words exchanged with her, that I was for King George. Her clan, her generous impulses, her traditions, her environment in France and the North had riveted the girl's heart to the Chevalier's cause. A plague o' both their houses! I was a Westmorland Layton, and none of us had ever drawn sword except for the King's Majesty against his enemies. The fear that her loyalty to the White Cockade might ruin my hopes, while it lasted, laid a stricture on my thoughts like ice on a pool. I say 'while it lasted,' for these black humours rarely gripped me for long. Youth, happily for this old world, is resilient in these sweet and hopeful affairs; and my visions,

if flecked by perplexities, were for the most part of wooing and winning Mistress Charlotte, of days afterwards in Eskdail, sheltered from alarms, in peace and content.

The dull boom of a gun from Edinburgh, reminding me that the grim old Castle still held out for King George, roused me from my musings, their essence, as I ruefully summed them up, appearing to be that I wished with all my heart that either I had been born a Jacobite or Mistress Charlotte a Royalist, a contemptibly barren result of an hour's cogitation.

In a quarter of an hour after I reached Edinburgh I was closeted with the lawyer.

'It's glad I am to see ye. I got your letter, but when I heard ye werena at the "White Horse" I had heavy thoughts, I can tell ye—heavy thoughts, sir.' He scrutinised my face with his keen and kind old eyes. 'Man, ye look drawn—as white as a corp! Are ye well? Where have ye been?'

I told him the whole black business.

'I've hearkened to mony clients' stories for the last forty years, but this dings them a'! The black-hearted villains!' said he when I finished, and paced up and down the little room in anger, revealing a vocabulary astonishingly different from his ordinary. 'We'll have the law on them—the law on them, sir!'

'Not yet! You forget that Glenira is an outlaw.'

He swore softly to himself. 'True. I had forgotten that!'

'Apart from Glenira's safety, there are other demands for caution; and, to make an end of it, I may tell you that young De Boux and I have a settled plan. Here is the position. We have a copy of the secret paper. Unfortunately, so has the gang on the other side. But the paper is, I think, only a memorandum, so to speak, well-nigh useless without further information, and that can come only from one man—Glenira himself. But, as you know, poor Glenira cannot help us. Bertrand tells me that he seldom speaks, and then only to himself, and with no coherence. His mind is as dark as his sight. For days he never utters a word. So we are going to sail north as soon as may be.'
